Energy Research Abstracts

Abstracts 1–2493

Office of Scientific and Technical Information
UNITED STATES DEPARTMENT OF ENERGY

The Office of Scientific and Technical Information

The Office of Scientific and Technical Information (OSTI) in Oak Ridge, Tennessee, provides direction for the Department of Energy's scientific and technical information (STI) program and maintains a centralized base of support to assist Departmental elements in planning, developing, and implementing STI activities. DOE-originated and worldwide literature and software on advances in subjects of interest to DOE researchers is collected, processed, and disseminated using computerized databases, publications, and other media.

This information collection containing over three million citations represents a major national resource of scientific and technical information. In addition to information acquired from DOE and its contractors, DOE acquires information through its international partnerships with the International Energy Agency's Energy Technology Data Exchange (ETDE), a consortium comprised of members from Europe, Japan, Canada, and the United States; the International Atomic Energy Agency's International Nuclear Information System, representing 80 countries; bilateral agreements with foreign governments; exchange agreements with other U.S. government agencies; and contracts with private information organizations and professional societies.

The subject scope of this information extends beyond energy, covering basic scientific studies in such areas as radiology, atomic and nuclear physics, radiation and nuclear chemistry, superconductivity, supercomputers, the environment, radioactive waste management, nuclear medicine, and arms control.

Major DOE databases are available within the United States through DIALOG Information Services and STN International and outside the United States through formal governmental exchange agreements. DOE and DOE contractor offices can access the databases online through the Integrated Technical Information System (ITIS) maintained by OSTI.

Energy Research Abstracts

Coverage

Energy Research Abstracts (ERA) provides abstracting and indexing coverage of all scientific and technical reports and patent applications originated by the U.S. Department of Energy, its laboratories, energy centers, and contractors, as well as theses and conference papers and proceedings issued by these organizations in report form. Audiovisual materials, computer media (magnetic tapes, diskettes, etc.), and engineering drawings are included in this definition. *ERA* also covers other energy information prepared *in report form* by federal and state government organizations, foreign governments, and domestic and foreign universities and research organizations, *provided* that the full text of the document has been received by OSTI. Foreign report information is obtained through the International Energy Agency's 14-nation Energy Technology Data Exchange, the International Atomic Energy Agency's International Nuclear Information System, or nation-to-nation agreements. The purpose of this publication is to announce documents produced or obtained by DOE that are not so readily available as journal articles, books, or patents.

Scope

The scope of *ERA* encompasses DOE's research, development, demonstration, and technology programs resulting from its broad charter for energy sources, supplies, safety, environmental impacts, and regulation.

The citations presented in *ERA* are available for online searching as records within the Energy Science and Technology Database (EDB). The current-year records are available on the Integrated Technical Information System (ITIS).

Availability

DOE and DOE contractors who have OSTI deposit accounts can obtain *ERA* (regular issues and annual indexes) from the Office of Scientific and Technical Information, P.O. Box 62, Oak Ridge, TN 37831, Attention: Information Services. For further information, call (615)576-8401. *ERA* is also available at authorized GPO Depository Libraries. (List is provided on the inside back cover.)

ERA (regular issues and annual indexes) is available to the public on a subscription basis from the Superintendent of Documents, U.S. Government Printing Office, Washington, D.C. 20402.

Managing Editor, Doris M. Henline
Technical Editor, Milton O. Whitson

Information Sources

The citations presented in *Energy Research Abstracts* are a subset of the worldwide energy information provided to the Office of Scientific and Technical Information (OSTI) through exchange agreements with foreign sources and through exchanges or contracts with U.S. organizations.

The **Energy Technology Data Exchange (ETDE)** was established by the International Energy Agency to promote cooperation among members in conducting appropriate energy-related research and development programs through the development of a formal central information sharing system. In accomplishing the objectives of the ETDE, members select, abstract, and index relevant research information published in their countries in accordance with Exchange standards. OSTI serves as the central receiving and processing center for this information, which it then disseminates to national centers in the participating countries. The following countries are currently members of the ETDE:

- Canada
- Denmark
- Finland
- France
- Federal Republic of Germany
- Italy
- Japan
- The Netherlands
- Norway
- Spain
- Sweden
- Switzerland
- United Kingdom
- United States

The **International Nuclear Information System (INIS)** was established to promote the exchange of information on nuclear science and technology. Its operation is similar to that of the ETDE, with the INIS Secretariat being located in Vienna, Austria. Currently, 79 countries and 15 international organizations are members of INIS. OSTI serves as the INIS national center for the United States.

In the exercise of its rights and responsibilities under the agreements to which it is a party, the **Office of Scientific and Technical Information** both receives information from the above sources and submits U.S.-produced information to them. In addition to materials generated by the Department of Energy, this U.S.-produced information is gathered from other government agencies as well as under contract with private information processing companies. All input is computer processed and entered into a database for online retrieval. The database serves as well for the production of numerous OSTI publications.

How To Read A Citation

The principal data elements included in these citations are:

1. **Abstract number** within volume.
2. **Report number** identification for report-type literature.
3. **Title and subtitle** (non-English title may appear in parentheses, if applicable).
4. **Author(s).** First 10 names in the data record are printed, then "et al." is listed.
5. **Author affiliation.** Only first one is listed, in parentheses after author(s) to which it applies.
6. **Collaboration,** if present.
7. **Corporate author(s)** identifying corporation responsible for document.
8. **Date of publication.** If not known, a processing date is in brackets.
9. **Number of pages** or page range. Prices are based on total pages unless special pricing applies.
10. **Language** of document if non-English.
11. **Monograph title** if citation is an analytic (part, chapter, or paper) of a larger monograph.
12. **Sponsoring organization.**
13. **Contract or grant number.**
14. **Secondary identifying number;** may be a conference number.
15. **Conference title, location, and date,** if applicable.
16. **Order number.** The "DE" order number may be used for ordering from NTIS or OSTI, as appropriate. The "TI" prefix is valid only at OSTI.
17. **Sources of availability** from which a copy of the document may be obtained; usually appear as abbreviations. (See information on following page.)
18. **Drop note** or explanatory statement.
19. **Abstract.**
20. **Subject descriptors.** Listed only if no abstract or only a brief statement is included.

54 (DOE/ER/60888-1-Vol.1, pp. 115-117) **Investigation of air pollution in house due to use of various fuels.** Luo, Dayu (Chengdu Sanitation (China)). Canada Mortgage and Housing Corp., Ottawa, ON (Canada). 1990. (CONF-900724-Vol.1: Indoor Air '90: 5th international conference on indoor air quality and climate, Toronto (Canada), 29 Jul - 3 aug 1990). In Indoor air '90: The fifth international conference on indoor air quality and climate. Volume 1: Final report. 786p. Order Number DE90017786. Source: NTIS.

Air pollution in houses caused by combustion of coal is more serious than that by combustion of natural gas and methane (primarily by SO_2 and NO_2). The gas concentration after cooking is higher than that before cooking, and it is higher in kitchen than in bedroom and outdoor. There were mutations in the extract from TSP in 30m^2 air in the bedroom, kitchen and outdoor, where coal and natural gas were used. The supernatant saliva activity of children whose family uses coal is significantly lower than that of pumping streams.

How To Order from the Availability Sources

TO OBTAIN A REPORT

Report literature, usually identified by an alphanumeric identifier at the beginning of a citation, is available from the sources listed in the citation (see example of element 2 on page iii). Often the sources are listed as abbreviations. Corresponding addresses are provided at right from which documents with these abbreviations may be ordered. When "OSTI" is given, **DOE and DOE contractors may order these documents from OSTI.** (However, check with your library or information organization which may require that orders go through them to OSTI.) OSTI prices are based on total pages unless special pricing applies. The public should order from NTIS or from one of the other agencies listed in the citation. NTIS price codes may continue to appear in some records. To expedite processing, an order form is provided in the back of this publication. NOTE: The order numbers provide quicker access for report ordering. Use the order number where possible.

How To Use the Indexes

Five indexes are provided for approaching the content of each issue of *Energy Research Abstracts*. Descriptions of entries in these indexes follow.

Corporate Author Index
The corporation, organization, or institution responsible for the issuance of the document is listed in this index. The entries are arranged alphabetically and provide the title and citation number of the reference. For example, the listing for the "Report" sample citation would appear as shown at right.

Wisconsin Univ., Madison (USA). Dept. of Physics
[Development of a hydrogen and deuterium polarized gas target for application in storage rings]: Progress report, 15:18494 (R;US)
Wisconsin Univ., Madison (USA). Lab. of Genetics
Organization of the R chromosome region in maize: Final progress report, June 1, 1983–May 31, 1986, 15:18255 (R;US)

Personal Author Index
Each author's name listed on a document cited in this issue is indexed. An index entry provides title and citation number; for secondary and other names, a cross-reference is given to the primary author name where the full index entry is located.

Hadley, D.L., *See* Lee, A.D., 15:17651
Haeberli, W., [Development of a hydrogen and deuterium polarized gas target for application in storage rings]: Progress report, 15:18494 (R;US)

Subject Index
This index lists the main subject descriptors assigned to each record by indexing professionals. A secondary or qualifier term is used where necessary to describe materials, objects, and processes. Document titles may be enhanced with additional informative phrases where necessary. An excerpt from this index appears at right.

HYDROGEN ISOTOPES
See also DEUTERIUM
HYDROGEN 4
TRITIUM
Neutron-Rich Isotopes
Study on the strong neutron-rich nuclei of lightest elements, 15:18686 (RA;SU;In Russian)

Contract Number Index
DOE technical reports are listed by contract number. Each entry also provides the primary corporation or organization cited for that contract number. A typical entry is shown.

FG02-88ER40438 **Wisconsin Univ., Madison (USA). Dept. of Physics**
15:18494 DOE/ER/40438–T1
FG02-88ER60664 **Rogers and Associates Engineering Corp., Salt Lake City, UT (USA)**

Report Number Index
Technical report literature is indexed by the alphanumerical identifier of the report. Patent documents and conferences are included for convenience. Each entry lists the citation number, the source of availability of the document, an indicator of presence at a GPO depository library, order number, and distribution category. A typical entry is:

DOE/ER/40438–
T1 15:18494 NTIS, OSTI E 1.99: DE89007246 MF-411

Subject Contents

The subject content of *Energy Research Abstracts* is arranged as shown below. The two-digit and four-digit category numbers printed here illustrate the category number assignment used in the database records.* The following list includes all of the 38 first-level and the 313 second-level categories. Because each issue of *ERA* publishes citations only for those documents announced during the past semimonthly period, some subject categories may not be present in every issue.

Numerical Listing of Categories

01 COAL LIGNITE, AND PEAT
- 03 Preparation
- 04 Processing
- 05 Products and By-Products
- 06 Properties and Composition
- 08 Waste Management
- 09 Environmental Aspects
- 10 Reserves, Geology, and Exploration
- 20 Mining
- 30 Transport, Handling, and Storage
- 40 Combustion
- 50 Economic, Industrial, and Business Aspects
- 60 Health and Safety
- 70 Legislation and Regulations

02 PETROLEUM
- 02 Reserves, Geology, and Exploration
- 03 Drilling and Production
- 04 Processing
- 05 Products and By-Products
- 06 Health and Safety
- 07 Economic, Industrial, and Business Aspects

1 (CONF-920736–) **Eighth annual coal preparation, utilization, and environmental control contractors conference: Proceedings.** USDOE Pittsburgh Energy Technology Center, PA (United States). [1992]. 682p. Sponsored by USDOE, Washington, DC (United States). From 8. coal preparation, utilization, and environmental control conference; Pittsburgh, PA (United States); 26-31 Jul 1992. Order Number DE92041184. Source: OSTI; NTIS; GPO Dep.

The Eighth Annual Coal Preparation, utilization, and Environmental Control Contractors Conference was held at Pittsburgh, Pa., July 27–30, 1992. Approximately 106 individual papers were given. Individual papers have been entered separately. (LTN)

2 (DOE/PC/79892–T21) **Development of the chemical and electrochemical coal cleaning (CECC) process: Final report.** Yoon, Roe-Hoan; Basilio, C.I. Virginia Center for Coal and Minerals Processing, Blacksburg, VA (United States). May 1992. 206p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-87PC79892. Order Number DE93000478. Source: OSTI; NTIS; GPO Dep.

The Chemical and Electrochemical Coal Cleaning (CECC) process developed at Virginia Polytechnic Institute and State University was studied further in this project. This process offers a new method of physically cleaning both low- and high-rank coals without requiring fine grinding. The CECC process is based on liberating mineral matter from coal by osmotic pressure. The majority of the work was conducted on Middle Wyodak, Pittsburgh No. 8 and Elkhorn No. 3 coals. The coal samples were characterized for a variety of physical and chemical properties. Parametric studies were then conducted to identify the important operating parameters and to establish the optimum conditions. In addition, fundamental mechanisms of the process were studied, including mineral matter liberation, kinetics of mineral matter and pyrite dissolution, ferric ion regeneration schemes and alternative methods of separating the cleaned coal from the liberated mineral matter. The information gathered from the parametric and fundamental studies was used in the design, construction and testing of a bench-scale continuous CECC unit. Using this unit, the ash content of a Middle Wyodak coal was reduced from 6.96 to 1.61% at a 2 lbs/hr throughput. With an Elkhorn No. 3 sample, the ash content was reduced from 9.43 to 1.8%, while the sulfur content was reduced from 1.57 to 0.9%. The mass balance and liberation studies showed that liberation played a more dominant role than the chemical dissolution in removing mineral matter and inorganic sulfur from the different bituminous coals tested. However, the opposite was found to be the case for the Wyodak coal since this coal contained a significant amount of acid-soluble minerals.

3 (DOE/PC/89766–T8) **Pelletization of fine coals: Technical progress report, March 1, 1992–May 31, 1992.** Sastry, K.V.S. California Univ., Berkeley, CA (United States). Dept. of Materials Science and Mineral Engineering. [1992]. 3p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG22-89PC89766. Order Number DE92040533. Source: OSTI; NTIS; GPO Dep.

The first step consisted of producing a batch of seed pellets (in the size range −4.75+4.00 mm) by pelletizing of 200 g of ground coal with desired additives (surface active agents and binders) and moisture content for 800 revolutions. The seed pellets are obtained by sieving the output from the batch drum. The second step involved the production of finished size pellets by layering the seed pellets with stepwise addition of moist feed which is again produced with desired additives and moisture content. Specifically, 25 g of the −4.75+4.00 mm seed pellets are placed in the drum and 20 g of moist fluffy feed is added every 80 revolutions for five times. After 400 revolutions the pellets are sieved on the 4.75 mm screen and the screen undersize which corresponds to new seeds generated during the layering cycles is discarded. Now, 30 g of moist fluffy feed is added every 50 revolutions for five more cycles. These layered pellets are sieved again and the −9.5+8.00 mm pellets. Coal agglomerates produced by the above described technique are nice and spherical. With our past experience with iron ore pelletization we learnt that as long as sufficient fluffy feed is available for the consumption by the seed pellets, they generally grow by forming layers consuming the feed rather than grow by coalescence. This is found to be true in the case of coal also. Growth by coalescence of coal pellets is found to yield raspberry type uneven agglomerates. After ascertaining the possibility of producing nice spherical pellets, several experiments have been conducted to develop the above standard procedure for making pellets in a reproducible way and testing them for their quality.

4 (DOE/PC/90174–T5) **Development of the selective coagulation process: Final report.** Yoon, R.H.; Luttrell, G.H. Virginia Center for Coal and Minerals Processing, Blacksburg, VA (United States). Jul 1992. 235p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-90PC90174. Order Number DE93000484. Source: OSTI; NTIS; GPO Dep.

The selective hydrophobic coagulation (SHC) process is based on the recent finding that hydrophobic particles can be selectively coagulated without using traditional agglomerating agents or flocculants. The driving force for the coagulation is the attractive energy between hydrophobic surfaces, an interaction that has been overlooked in classical colloid chemistry. In most cases, selective separations can be achieved using simple pH control to disperse the mineral matter, followed by recovery of the coal coagula using techniques that take advantage of the size enlargement. In the present work, studies have been carried out to further investigate the fundamental mechanisms of the SHC process and the parameters that affect the process of separating coal from the ash-forming minerals and pyritic sulfur. Studies have included direct force measurements of the attractive interaction between model hydrophobic surfaces, in-situ measurements of the size distributions of coagula formed under a variety of operating conditions, and development of a population balance model to describe the coagulation process. An extended DLVO colloid stability model which includes a hydrophobic interaction energy term has also been developed to explain the findings obtained from the experimental studies. In addition to the fundamental studies, bench-scale process development test work has been performed to establish the best possible method of separating the coagula from dispersed mineral matter. Two types of separators, i.e., a sedimentation tank and a rotating drum screen, were examined in this study. The sedimentation tank proved to be the more efficient unit, achieving ash reductions as high as 60% in a single pass while recovering more than 90% of the combustible material. This device, which minimizes turbulence and coagula breakage, was used in subsequent test work to optimize design and operating parameters.

5 (DOE/PC/91283–T2) **Liquid chromatographic analysis of coal surface properties: Quarterly progress report, September–December 1991.** Kwon, K.C. Tuskegee Univ., AL (United States). Dept. of Chemical Engineering. [1991]. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG22-91PC91283. Order Number DE92040537. Source: OSTI; NTIS; GPO Dep.

The main objectives of this proposed research are to refine further the inverse liquid chromatography technique for the study of surface properties of raw coals, treated coals and coal minerals in water, to evaluate relatively surface properties of raw coals, treated coals and coal minerals by inverse liquid chromatography, and to

evaluate floatability of various treated coals in conjunction with surface properties of coals. Alcohols such as methanol, ethanol, isopropanol, isobutanol, tert-butanol, heptanol, 1-hexadecanol, 2-methyl-pentanol, 4-methyl-2-penthanol (methylisobutyl carbinol), n-octanol, s-octanol, and cyclohexanol as probe compounds are utilized to evaluate hydrophilicity of coals and coal minerals. N-alkanes such as hexane, heptane and octane, and stearic acid are employed as probe compounds to evaluate hydrophobicity of coals and coal minerals. Aromatic compounds such as benzene and toluene as probe compounds are used to examine aromaticity of coal surface. Aromatic acids such as o-cresol, m-cresol, p-cresol, phenol and B-naphthol are used to detect aromatic acidic sites of coal surface. Hydrophilicity, hydrophobicity and aromaticity of surfaces for either raw coals or treated coals in water are relatively determined by evaluating both equilibrium physical/chemical adsorption and dynamic adsorption of probe compounds on various raw coals and treated coals to compare affinities of coals for water.

6 (DOE/PC/91290–T3) **Non-intrusive measurement of particle charge: Electrostatic dry coal cleaning: Technical progress report No. 4, April 1, 1992–June 30, 1992.** Schaefer, J.L.; Stencel, J.M.; Ban, H. Kentucky Univ., Lexington, KY (United States). Center for Applied Energy Research. [1992]. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG22-91PC91290. Order Number DE93000736. Source: OSTI; NTIS; GPO Dep.

A test apparatus utilizing a Phase Doppler Particle Analyzer was developed to non-intrusively determine charge on small particles. Optimum operating conditions for the system were determined using highly characterized silica spheres with an average particle diameter of 60μ in a dry N_2 gas. The silica spheres were triboelectrically charged, and passed through a high intensity electric field. The charged particle trajectories, diameter, and number density were monitored using a two component laser PDPA. From this data and known operating parameters charge magnitude was determined.

7 (DOE/PC/91334–T69) **Dewatering studies of fine clean coal: Technical report, March 1, 1992–May 31, 1992.** Parekh, B.K. (Kentucky Univ., Lexington, KY (United States). Center for Applied Energy Research). Illinois State Geological Survey, Champaign, IL (United States). [1992]. 22p. Sponsored by USDOE, Washington, DC (United States); Illinois Dept. of Energy and Natural Resources, Springfield, IL (United States). DOE Contract FG22-91PC91334. Order Number DE93000519. Source: OSTI; NTIS; GPO Dep.

Physical cleaning of ultra-fine coal using an advanced froth flotation technique provides a low ash product, however, due to high surface area of particles the amount of water associated with clean coal is high. Economic removal of water to 20 percent or lower moisture level from the clean coal froth will be important for commercial applicability of advanced froth flotation processes. The main objective of the present research program is to study and understand the dewatering characteristics of ultra-fine clean coal and to develop process parameters to effectively reduce the moisture to less than 20 percent in the clean coal product. The research approach under investigation utilizes synergistic effect of metal ions and surfactant to lower the moisture of clean coal using a conventional vacuum dewatering technique. The studies have identified a combination of metal ions and surfactant found to be effective in providing a 22 percent moisture filter cake. During the third quarter, efforts were made to understand reagent adsorption mechanism. Adsorption studies indicated that the presence of metal ions enhanced adsorption of surfactant. It appears that metal ions induced floc formation at pH ~7.0, which are hydrophilic in nature, however addition of surfactant restores the hydrophobicity. Organic polymers along with metal ions were found to be effective in dewatering of fine coal. Continuous filtration tests conducted using a drum filter provided a filter cake containing 24 percent moisture. Additional studies on mechanism of adsorption and continuous filtration using AC Electro-Coagulation will be conducted in the next quarter.

8 (DOE/PC/91334–T73) **Thermal treatment for chlorine removal from coal: [Quarterly] technical report, March 1, 1992–May 31, 1992.** Muchmore, C.B.; Hesketh, H.E.; Chen, Han Lin. Southern Illinois Univ., Carbondale, IL (United States). [1992]. 24p. Sponsored by USDOE, Washington, DC (United States); Illinois Dept. of Energy and Natural Resources, Springfield, IL (United States). DOE Contract FG22-91PC91334. Order Number DE93000522. Source: OSTI; NTIS; GPO Dep.

It is the goal of this research to provide the technical basis for development of a process to remove chlorine from coal prior to combustion, based on a thermal treatment process. Under the reaction conditions employed, the behavior of other trace elements of concern will also be evaluated. The recovery of the chlorine removed from the coal as a marketable byproduct, calcium chloride suitable for use as a road deicer, is also being investigated using a novel absorption/crystallization device. A value of 6.29 hr^{-1} was determined for the dechlorination rate constant of IBC-109 coal at 385°C, and an activation energy of 34.7 kcal/mol was obtained from an Arrhenius plot over the temperature range of 300–385°C. A significant removal of chlorine (84.3%) was attained while retaining 92% of the energy of the coal in the solid product by preheating the coal at lower temperatures prior to a six-minute reaction at 385°C. Volatiles lost during the thermal dechlorination may be recovered for their heating value, and/or as a source of chemical feedstocks; this aspect will require further study, but it appears that the overall energy balance on the system should prove to be favorable. The design of the bench scale fluidized bed thermal dechlorination unit has been completed, and components ordered. Operation of this system should provide the information required for further scale-up of the process.

9 (DOE/PC/91334–T84) **A novel technique for evaluating cleaned fine and ultrafine coal: [Quarterly] technical report, 1 March 1992–31 May 1992.** Crelling, J.C.; Hippo, E.J. Southern Illinois Univ., Carbondale, IL (United States). [1992]. 23p. Sponsored by USDOE, Washington, DC (United States); Illinois Dept. of Energy and Natural Resources, Springfield, IL (United States). DOE Contract FG22-91PC91334. Order Number DE93000533. Source: OSTI; NTIS; GPO Dep.

As a standard industrial practice all commercially cleaned coals are evaluated by washability analysis to predict their cleaning potential. The results of this analysis are so important that coal washability is a major factor in deciding to purchase and develop coal holdings. However, washability analysis are at present limited to coal particle sizes of greater than -28 mesh (0–6 mm)- Coal particles smaller than this limit 0 separate well in the standard sink-float process used in the washability tests. The increasing demand for cleaner coals requires that coals be crushed to fine (-100 mesh - 0.15 mm) and ultrafine (-325 mesh- 0.045 mm) sizes to liberate more of the fine-grained mineral matter including pyrite. However, such small coal particles can not be analyzed in the standard washability analysis. The purpose of this study is to develop a washability analysis system for fine and ultrafine coal particles using Density Gradient Centrifugation (DGC) and Thermal Gravimetric Analysis (TGA) techniques. The unique advantages of this proposed technique is that it provides a means to obtain usable washability curves on fine and ultrafine coal samples. The DGC technique will produce a large number of density fractions in a single run and, thus, is much faster and more efficient that normal washability analysis. The results to date indicate that only a single DGC run is needed to produce all twelve density fractions for a washability analysis. The recoveries of the fractions are sufficient for sulfur and ash analysis and washability analyses have been successfully completed using the DGC technique. For the Herrin No. 6 sample (IBCSP 101-SIU 2181) there appears to be little difference in recovery for the four size fractions, however, the smaller size fractions do have slightly more liberated ash and pyrite.

10 (VTT-SYMP–134) **Artificial dewatering of peat.** Alakangas, E. (ed.). Technical Research Centre of Finland, Espoo (Finland). 1992. 149p. (CONF-9110428–: Conference on artificial dewatering of peat, Jyvaeskylae (Finland), 15-16 Oct 1991). Order Number DE93721607. Source: OSTI; NTIS.

This publication presents in edited form the proceedings of the research seminar held in Jyvaeskylae on 15-l6th October 1991. The seminar was a part of Nordic cooperation in the research area of artificial dewatering of peat. There are research programmes on artificial dewatering of peat both in Finland and in Sweden. These programmes aim to develop economical peat production methods

which are not dependent on weather or the season. This proceeding consists of papers of mining and transportation of peat, dewatering of peat and utilization technology for wet peat.

11 (VTT-SYMP–134, pp. 17-26) **Peat-digging all-year-round.** Vestman, E. (Haegglunds Component Ab, Mellansel (Sweden). Division Mining and Tunneling Machinery). Technical Research Centre of Finland, Espoo (Finland). 1992. (CONF-9110428–: Conference on artificial dewatering of peat, Jyvaeskylae (Finland), 15-16 Oct 1991). In *Artificial dewatering of peat.* 149p. Order Number DE93721607. Source: OSTI; NTIS.

In the spring 1984 ABB STAL, Haegglunds and the Swedish State Power Board began to plan a common development project in the field of peat. The purpose was to develop a system for production of dry peat fuel all the year round. A part of the system was to be the peat-digging equipment from Haegglund. Between the autumn of 1984 until the summer of 1985 the first stage of the project was carried out. During this time Haegglunds developed a system for deep excavating of peat all the year round while the Swedish State Power Board tested press-systems for the mechanical dewatering of the peat. At ABB STAL the development work on the fluidized bed-dryer continued. The result of this work was so positive that it was decided to continue the project and build a pilot plant. A fullscale plant was to be built later.

12 (VTT-SYMP–134, pp. 27-34) **Efficiency and environmental effects of peat dewatering by mechanical pressing.** Aho, M. (Technical Research Centre of Finland, Jyvaeskylae (Finland). Combustion and Thermal Engineering Lab.); Pirkonen, P. Technical Research Centre of Finland, Espoo (Finland). 1992. (CONF-9110428–: Conference on artificial dewatering of peat, Jyvaeskylae (Finland), 15-16 Oct 1991). In *Artificial dewatering of peat.* 149p. Order Number DE93721607. Source: OSTI; NTIS.

Changes in the structures of three types of Finnish peats (C, B and S) and the emissions into pressing water were studied during mechanical pressing. Pressing was done at pH 3.2 by using the Fennopol A 3006 (weakly anionic polyacrylamide-type) chemical. This combination has previously been found to be the most inexpensive and effective combination for peat pressing. The dry solid load was 2.4 kg/m2. Clear differences were obtained in the water binding capacities of the peats studied. The dry solid contents of the peats after the pressing time of 500 seconds in 2.0 MPa by a computer controlled piston press of two-way water outlet were as follows: C-peat 37.0 %, B-peat 33.5 % and S-peat 27.5 %. A large amount of the chemical was bound to peat during flocculation. 20-40 % of calcium and magnesium were released from the peat due to lowered pH, and > 80 % of iron and aluminum remained in the peat. Most of the sulfur of the sulfuric acid used for lowering of pH was found in the pressing water. Neutralizing the pressing water by calcium hydroxide to pH 7 costs about 8 USD per 1000 m3. The chemical costs of pressing are about 5 USD/t of dried peat.

13 (VTT-SYMP–134, pp. 35-51) **Some fundamental aspects of the dewatering of peat.** Theliander, H. (Chalmers University of Technology, Goethenburg (Sweden). Dept. of Chemical Engineering Design); Andersson, H.K.; Gren, U.; Muenter, M. Technical Research Centre of Finland, Espoo (Finland). 1992. (CONF-9110428–: Conference on artificial dewatering of peat, Jyvaeskylae (Finland), 15-16 Oct 1991). In *Artificial dewatering of peat.* 149p. Order Number DE93721607. Source: OSTI; NTIS.

Before peat from a bog can be used as a fuel most of the water must be separated. The major of the separation work is done by means of mechanical dewatering (filtration and expression). However, there are many problems related to mechanical dewatering of peat. To get a better understanding of dewatering of peat it is important to find models which describes the filtration and expression course. This paper presents some basic concepts to describe the filtration and expression properties of peat. It has been shown that the specific surface area and the specific filtration resistance increases with the humification degree of the peat. Furthermore, the compressibility constant decreases with the humification degree. It is therefore most likely that the filtration properties can be used as a measure to characterize peat. In order to describe the expression course three different models have been investigated. It was shown that of these models the so called Shirato model was the most reliable.

14 (VTT-SYMP–134, pp. 52-69) **Mechanical peat dewatering in the ultrapresse unit.** Henfridsson, U. (Vattenfall Utveckling AB, Aelvkarleby (Sweden). Research and Development, Technical Services). Technical Research Centre of Finland, Espoo (Finland). 1992. (CONF-9110428–: Conference on artificial dewatering of peat, Jyvaeskylae (Finland), 15-16 Oct 1991). In *Artificial dewatering of peat.* 149p. Order Number DE93721607. Source: OSTI; NTIS.

Vattenfall Utveckling AB, Research and Development, Technical Services is managing peat research in a number of different projects. The objective of this vork is to develop year around processes for productions of high quality fuel. In a peat production system that is weather independent a successful mechanical dewatering step is needed. Since dewatering is the key process in a peat production system, this work has so far been concentrated on tests of dewatering equipments in laboratory and pilote scale. The goal that has been stipulated in our work is to reach about 35 - 40 % DS-content in the mechanical dewatering step at an acceptable pressing capacity (14). The capacity goals for the pressing equipment must be related to the costs rather than to the specific capacity of the different presses. The capacity will therefore be judged in proportion to the investment.

15 (VTT-SYMP–134, pp. 70-84) **Results of dewatering research in Rittenshaus and Blecher chamber filter.** Wilde, J. (Vattenfall Utveckling AB, Aelvkarleby (Sweden). Research and Development, Technical Services). Technical Research Centre of Finland, Espoo (Finland). 1992. (CONF-9110428–: Conference on artificial dewatering of peat, Jyvaeskylae (Finland), 15-16 Oct 1991). In *Artificial dewatering of peat.* 149p. Order Number DE93721607. Source: OSTI; NTIS.

Vattenfall Utveckling AB have since 1985 been working with studies of weather independent production systems for peat fuel. The main problem in weather independent systems is to make the mechanical dewatering efficient enough to remove the main part of the water in the raw peat. To be able to produce a dry fuel and keep the thermal drying stage at a low cost the mechanical dewatering must be able to dewater the peat to more than 30 % dry solid content. The work at the laboratory has been focused on testing of dewatering equipment in a pilot scale. The goal for the tests has been to find a dewatering system that could dewater raw peat to more than 30 % dry solid content at a high capacity. The object of the project is to present a weather independent system that can produce peat fuel to a cost competitive to other fuels. One of the press systems that has been successful is dewatering of peat slurry with flocculants added in a high pressure chamber filter. The filter is manufactured by Rittershaus and Blecher GmbH Germany.

16 (VTT-SYMP–134, pp. 85-100) **Evaluation of the Adewa process.** Pirkonen, P. (Technical Research Centre of Finland, Jyvaeskylae (Finland). Combustion and Thermal Engineering Lab.). Technical Research Centre of Finland, Espoo (Finland). 1992. (CONF-9110428–: Conference on artificial dewatering of peat, Jyvaeskylae (Finland), 15-16 Oct 1991). In *Artificial dewatering of peat.* 149p. Order Number DE93721607. Source: OSTI; NTIS.

The main goal of the Adewa-research programme is to create a peat production method based on artificial dewatering. The most important subgoal is to obtain a dry solid content of 35 % in the mechanical dewatering phase with the economically viable capacity. The most interesting process alternative to produce peat for a power plant of 150 MW electricity is so called SLURRY-COMP-method which is based on slurry pumping and mechanical dewatering. The economical evaluation presented in this paper is focused on this method.

17 (VTT-SYMP–134, pp. 9-16) **Pumping properties of peat slurry.** Luukkainen, V.M. (Technical Research Centre of Finland, Espoo (Finland)). Technical Research Centre of Finland, Espoo (Finland). 1992. (CONF-9110428–: Conference on artificial dewatering of peat, Jyvaeskylae (Finland), 15-16 Oct 1991). In *Artificial dewatering of peat.* 149p. Order Number DE93721607. Source: OSTI; NTIS.

In the Adewa research programme a new peat production method, called SLURRY-COMP, has been found to be the most

viable way to produce peat for the artificial dewatering process. According to the process concept, peat, after being slurried to a DS-content of about 7 %, is pumped from the slurrying basin into a large storage pond situated near the power plant, and after that to the mechanical dewatering process. The aim of the studies carried out at Technical Research Centre of Finland is to obtain enough reliable information for the optimization of long distance pumping of peat slurry. Pumping tests with peat slurries have been carried out on the bog as well as under laboratory conditions. The DS-contents of the slurries have been 4 - 7 % on the bog and 5 - 9 % in the laboratory. According to the pressure losses measured in pipes of different sizes (inner diameters being 140 - 400 mm), the optimal DS-content of the slurry would be about 6 - 7 % with the medium humified Sphagnum peat. The viscosities of slurries made from the most common peats in Northern Finland, i.e. Carex peat, are smaller than those of the slurries made from Sphagnum peat, and, thus, the optimal DS-content with Carex peat may rise as high as to 7 - 8 %. In addition to peat type, also mining and slurrying technique (determining the particle size), pipe diameter, and flow velocity have a great influence on the flowing properties and pressure losses of peat slurry.

18 (VTT-SYMP–134, pp. 116-127) **New process alternatives for utilisation of wet peat.** Aeijaelae, M. (Imatran Voima Oy, Vantaa (Finland). R and D Center); Hulkkonen, S.; Raiko, M. Technical Research Centre of Finland, Espoo (Finland). 1992. (CONF-9110428–: Conference on artificial dewatering of peat, Jyvaeskylae (Finland), 15-16 Oct 1991). In *Artificial dewatering of peat.* 149p. Order Number DE93721607. Source: OSTI; NTIS.

To improve the economy of power generation with wet fuels, IVO has initiated the development of an advanced gas turbine power plant process for wet fuels as peat and biomass. The process consists of a steam injected gas turbine, an air-blown gasifier and a pressurized fuel dryer. The dryer operates in steam atmosphere and is integrated to the process to produce injection steam for the gas turbine. The heat needed for drying is taken from the exhaust gases of the gas turbine. This process is patented and called IVO-SDIG. By utilising integrated fuel drying, air gasification and a gas turbine-based process, a very high power generating efficiency is obtained. This enables a process efficiency of more than 50 % (calculated based on the lower heating value of the fuel). Other advantages provided by the IVO-STIG process are its simplicity low investment costs for small-size plants (20 - 100 MW_e) and capability of using wet low-grade fuels (moisture content up to 70 - 75 %) The economic calculations made by Imatran Voima Oy show that the cost of electricity of the IVO-SDIG process is lower than that with conventional processes.

19 (VTT-SYMP–134, pp. 128-138) **New power plant connected to Adewa process.** Flyktman, M. (Technical Research Centre of Finland, Jyvaeskylae (Finland). Combustion and Thermal Engineering Lab.). Technical Research Centre of Finland, Espoo (Finland). 1992. (CONF-9110428–: Conference on artificial dewatering of peat, Jyvaeskylae (Finland), 15-16 Oct 1991). In *Artificial dewatering of peat.* 149p. Order Number DE93721607. Source: OSTI; NTIS.

A combination of a gas turbine cycle and steam turbine cycle in has been the key to higher power plant efficiency. Applications based on pressurized fluidized bed combustion (PFBC), including its different modifications, or pressurized gasification (IGCC), also including several modifications, have been developed. The first of these applications are being commercialized. The newest applications are being developed on basis of pressurized pulverized fuel combustion (PPFC). This technique yields possibilities for high efficiency in producing electricity. Commercialization is expected to start by the late 1990's. The present status of the research and development of PPFC- combustion is discussed. The possible concepts for the application in Finnish electricity production is given. Peat produced by ADEWA process can be used as a fuel in PPFC-power plant.

20 (VTT-SYMP–134, pp. 139-145) **Experience of the peat briquette production at Haerjedalens Mineral Ab in Sveg.** Nordstroem, H. (Uppsala Energi Ab, Uppsala (Sweden)). Technical Research Centre of Finland, Espoo (Finland). 1992. (CONF-9110428–: Conference on artificial dewatering of peat, Jyvaeskylae (Finland), 15-16 Oct 1991). In *Artificial dewatering of peat.* 149p. Order Number DE93721607. Source: OSTI; NTIS.

The peat briquette production at Haerjedalens Mineral Ab in Sveg has now reached a level corresponding to the dimensioning data for the plant. During especially 1989 we had to evaluate and reconstruct some vital functions of the process and there are still solutions that must be better. However, until now, October 1991, ca 400 000 tons of briquettes have been produced. The costs are a bit higher than we calculated but the production is definitely going the right way and today peat is the best alternative for Uppsala Energi Ab compared to for example fossile fuels.

21 (CONF-920815–9) **Hydrous pyrolysis of four Argonne Premium coals.** Serio, M.A.; Kroo, E.; Charpenay, S.; Solomon, P.R. Advanced Fuel Research, Inc., East Hartford, CT (United States). [1992]. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-89PC89878. From 204. American Chemical Society national meeting; Washington, DC (United States); 23-28 Aug 1992. Order Number DE93000704. Source: OSTI; NTIS; GPO Dep.

Pretreatment experiments were done under hydrous pyrolysis conditions with four Argonne Premium coals (Zap lignite, Wyodak subbituminous, Illinois bituminous, Pittsburgh bituminous) over a range of temperatures (250–350°C) and pressures (1000 - 4000 psig). The residues from these experiments were further studied by programmed pyrolysis in a TG-FTIR system. The yields of pyrolysis tar were found to increase sharply at short pretreatment times (< 60 min at 350°C) and decline slowly at longer times. The yields of pyrolysis methane increase monotonically with pretreatment time, while the yields of pyrolysis CO_2 decline monotonically. All of these trends are in agreement with the contention that hydrous pyrolysis is similar to an accelerated geological aging of the coal. The results for CO evolution were somewhat contrary in that there was usually an initial increase followed by a decline. It is believed that this CO results from decomposition of hydroxy and dihydroxy structures which are created by the hydrous pyrolysis process.

The degradation of the carboxylic acid group has been examined with respect to potential pretreatment strategies for fossil fuel conversion processes. In one potential pretreatment strategy involving cation exchange of the carboxylic acid group, a series of benzoic acid and stearic acid salts have been chosen to model the "tight" carboxylic acids of immature fossil fuel feedstocks and have been pyrolyzed with an entrained flow reactor. Our preliminary results indicate that Group I and II salts yield primarily the parent acid. Benzoate salts also yield small amounts of benzene while the stearic acid salts give no other detectable products. In two alternative treatment strategies, esterification and anhydride preparation have also been accomplished with these compounds being subjected to the entrained flow reactor conditions. The benzoate esters give a number of products, such as benzaldehyde, benzene, and low MW gases. The formation of these compounds is extremely dependent on pyrolysis conditions and alkoxy chain length. A xenon flashlamp and an entrained flow reactor have been used to heat organic substrates to varying temperatures using different heating rates. Ultrarapid flashlamp pyrolysis (heating rate $>10^{50}$C/s) has been performed. Since the ultrarapid pyrolysis products differ from those observed with traditional heating techniques and differ from the products formed photochemically, the flashlamp pyrolysis products are attributed to high temperature thermal activation.

23 (DOE/MC/25020–3129) **Upgrading of raw oil into advanced fuel: Task 5.** Lummus Crest, Inc., Bloomfield, NJ (United States). Oct 1991. 52p. Sponsored by USDOE, Washington, DC

(United States). DOE Contract AC21-88MC25020. Order Number DE93000214. Source: OSTI; NTIS; GPO Dep.

The overall objective of the research effort is the determination of the minimum processing requirements to produce high energy density fuels (HEDF) having acceptable fuel specifications. The program encompasses assessing current technology capability; selecting acceptable processing and refining schemes; and generating samples of advanced test fuels. The Phase I Baseline Program is intended to explore the processing alternatives for producing advanced HEDF from two raw synfuel feedstocks, one from Mild Coal Gasification as exemplified by the COALITE process and one from Colorado shale oil. Eight key tasks have been identified as follows: (1) Planning and Environmental Permitting; (2) Transporting and Storage of Raw Fuel Sources and Products; (3) Screening of Processing and Upgrading Schemes; (4) Proposed Upgrading Schemes for Advanced Fuel; (5) Upgrading of Raw Oil into Advanced Fuel (6) Packaging and Shipment of Advanced Fuels; (7) Updated Technical and Economic Assessment; and, (8) Final Report of Phase I Efforts. This topical report summarizes the operations and results of the Phase I Task 5 sample preparation program. The specific objectives of Task 5 were to: Perform laboratory characterization tests on the raw COALITE feed, the intermediate liquids to the required hydroprocessing units and final advanced fuels and byproducts; and produce a minimum of 25-gal of Category I test fuel for evaluation by DOE and its contractors.

24 (DOE/MC/26233–2935) **Advanced development of the Nested Fiber Filter: Phase 1, Evaluation of cleaning methods: Final report.** Litt, R.D.; Conkle, H.N.; Glover, R.C.; Jordan, H. Battelle, Columbus, OH (United States). Aug 1990. 40p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC21-89MC26233. Order Number DE91002019. Source: OSTI; NTIS; GPO Dep.

Battelle has completed Phase I of the DOE program to evaluate cleaning methods for the Nested Fiber Filter (NFF). The results of the investigations into fly ash bonding mechanisms, and mechanical vibration and acoustic vibration techniques led to the conclusion that acoustic cleaning with a pulse combustor is the preferred integrated system for high-temperature, high-pressure applications.

25 (DOE/MC/26366–2979) **A calcium oxide sorbent process for bulk separation of carbon dioxide: Annual report, September 1989–August 1990.** Harrison, D.P. Louisiana State Univ., Baton Rouge, LA (United States). Dept. of Chemical Engineering. Sep 1990. 100p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC21-89MC26366. Order Number DE91002059. Source: OSTI; NTIS; GPO Dep.

This research effort is designed to investigate the technical feasibility of a high-temperature, high-pressure process for the bulk separation of CO_2 from coal-derived gases. The two-year contract was awarded in September 1989. This report describes the research effort and results obtained during the first year of the effort. The overall project consists of 6 tasks, four of which were active during year 01. Tasks 1 and 2 were completed during the year while activity in Tasks 3 and 6 will carry over into year 02. Tasks 4 and 5 will be initiated during year 02. Three primary objectives were met in Task 1. A literature search on the calcination-carbonation reactions of CO_2 with calcium-based sorbents was completed. A high temperature, high pressure (HTHP) electrobalance reactor suitable for studying the calcination and carbonation reactions was constructed. This reactor system is now fully operable and we are routinely collecting kinetics data at temperatures in the range of 550-900°C and pressures of 1 to 15 atm. Samples of nine candidate calcium-based sorbents were acquired and tested. These samples were subjected to reaction screening tests as part of Task 2. As a result of these screening tests, chemically pure calcium carbonate, chemically pure calcium acetate, and the commercial dolomite were selected for more detailed kinetic testing. In Task 3, the HTHP electrobalance reactor is being used to study the calcination-carbonation behavior of the three base sorbents as a function of calcination temperature, carbonation temperature, carbonation pressure, and CO_2 concentration.

26 (DOE/PC/89869–T7) **Development of a stable cobalt-ruthenium Fischer-Tropsch catalyst: Technical progress reports No. 7 and 8, April 1, 1991–September 30, 1991.** Abrevaya, H. UOP, Inc., Des Plaines, IL (United States). [1991]. 42p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-89PC89869. Order Number DE92041239. Source: OSTI; NTIS; GPO Dep.

The objective of this contract is to examine the relationship between catalytic properties and the function of cobalt Fischer-Tropsch catalysts and to apply this fundamental knowledge to the development of a stable cobalt-based catalyst with a low methane-plus-ethane selectivity for use in slurry reactors. An experimental cobalt catalyst 585R2723 was tested three times in the fixed-bed reactor. The objective of the tests was to identify suitable testing conditions for screening catalyst. The α-alumina was determined to be a suitable diluent medium for controlling the catalyst bed temperature close to the inlet temperature. With 13 g of catalyst and 155 g of diluent, the catalyst maximum temperature were within 2°C from the inlet temperatures. As a result of this work, 210°C and 21 atm were shown to result in low methane selectivity and were used as initial conditions in the catalyst screening test. Ethane, which along with methane is undesirable, is typically produced with low selectivity and follows the same trend as methane. Other work reported here indicated that methane selectivity increases with increasing temperature but is not excessively high at 230°C. Consequently, the catalyst screening test should include an evaluation of the catalyst performance at 230°C. During Run 67, the increase in temperature from 210°C to 230°C was initiated at 30 hours on-stream.

27 (DOE/PC/89869–T8) **Development of a stable cobalt-ruthenium Fischer-Tropsch catalyst: Technical progress report No. 9, October 1, 1991–December 31, 1991.** Abrevaya, H. UOP, Inc., Des Plaines, IL (United States). 26 Aug 1992. 19p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-89PC89869. Order Number DE92041283. Source: OSTI; NTIS; GPO Dep.

The work performed in the program suggests that cobalt catalytic performance is a complex function of crystallite size, crystallite composition, and cobalt-support interaction. These properties are determined by the nature of support, the bimetallic component, the promoters, and the method of preparation. Results so far indicate that the lowest methane selectivity occurs on support No. 8, and the highest activity is obtained on support No. 10. Also, promoters 2 and 3 may help lower the formation of methane. These findings, along with the catalyst knowledge gained during Union Carbide's former contract AC22-84PC70028, will be used to develop a superior cobalt catalyst.

28 (DOE/PC/89883–45) **Coal liquefaction process streams characterization and evaluation: FT-IR methods for characterization of coal liquefaction products.** Serio, M.A. (Advanced Fuel Research, Inc., East Hartford, CT (United States)); Teng, H.; Bassilakis, R.; Solomon, P.R. Consolidation Coal Co., Library, PA (United States). Research and Development Dept.; Advanced Fuel Research, Inc., East Hartford, CT (United States). Apr 1992. 122p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-89PC89883. Order Number DE92041236. Source: OSTI; NTIS; GPO Dep.

This study was designed to demonstrate the use of two FTIR techniques for the analysis of direct coal liquefaction process-derived materials. The two methods were quantitative FTIR analysis and themogravimetric (TG) analysis with FTIR analysis of evolved products (TG-FTIR). The quantitative FTIR analyses of both whole resids and THF-soluble resids provided quantitation of total hydrogen, aliphatic and aromatic hydrogen, total carbon, total oxygen, hydroxyl and etheric oxygen, and ash contents. The FTIR results were usually in agreement with values derived by other, more conventional methods. However, the accuracies of specific measurements, in comparisons with results from conventional methods, ranged from good to poor. The TG-FTIR method provided approximate analyses of coals and resids. The data provided included the time dependent evolution profiles of the volatile species and the elemental composition of the char. Reproducible data of gaseous species and pyrolysis tar yields for whole resid samples larger than 10 mg were obtainable. The yields and evolution profiles of certain volatiles (tar, CO, and methane) provided structural

information on the samples. There were some experimental and interpretational difficulties associated with both techniques. Optimization of the curve-resolving routine for coal-liquefaction samples would improve the quantitative FTIR accuracy. Aerosol formation limited the full application of the TG-FTIR technique with the THF-soluble resid samples. At this time, further development of these analytical methods as process development tools will be required before their use for that purpose can be recommended. The use of FTIR as an on-line analytical technique for coal liquefaction process streams requires demonstration before it can be recommended; however, such a demonstration may be warranted.

29 (DOE/PC/89883–47) **Coal liquefaction process streams characterization and evaluation: Application of liquid chromatographic separation methods to THF-soluble portions of integrated two-stage coal liquefaction resids.** Green, J.B. (National Inst. for Petroleum and Energy Research, Bartlesville, OK (United States)); Pearson, C.D.; Young, L.L.; Green, J.A. Consolidation Coal Co., Library, PA (United States). Research and Development Dept.; National Inst. for Petroleum and Energy Research, Bartlesville, OK (United States). May 1992. 45p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-89PC89883. Order Number DE92041235. Source: OSTI; NTIS; GPO Dep.

This study demonstrated the feasibility of using non-aqueous ion exchange liquid chromatography (NIELC) for the examination of the tetrahydrofuran (THF)-soluble distillation resids and THF-soluble whole oils derived from direct coal liquefaction. The technique can be used to separate the material into a number of acid, base, and neutral fractions. Each of the fractions obtained by NIELC was analyzed and then further fractionated by high-performance liquid chromatography (HPLC). The separation and analysis schemes are given in the accompanying report. With this approach, differences can be distinguished among samples obtained from different process streams in the liquefaction plant and among samples obtained at the same sampling location, but produced from different feed coals. HPLC was directly applied to one THF-soluble whole process oil without the NIELC preparation, with limited success. The direct HPLC technique used was directed toward the elution of the acid species into defined classes. The non-retained neutral and basic components of the oil were not analyzable by the direct HPLC method because of solubility limitations. Sample solubility is a major concern in the application of these techniques.

30 (DOE/PC/90055–T5) **Technology development for iron Fischer-Tropsch catalysts: Technical progress report No. 4, June 26, 1991–September 26, 1991.** Frame, R.R. UOP, Inc., Des Plaines, IL (United States). 26 Aug 1992. 44p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-90PC90055. Order Number DE92041282. Source: OSTI; NTIS; GPO Dep.

The preparation of binderless iron oxide spheres has been achieved by a novel sol-gel forming procedure. The starting material is a solution of iron (III) 2-ethylhexanoate in mineral spirits. This solution is added dropwise to an ammoniacal solution of methanol. The low viscosity of the methanol causes the formation of small droplets of the iron solution. The immiscibility of the mineral spirit solution in the methanol and the difference in surface tensions cause the droplets to assume a spherical shape. The presence of ammonia and water at low levels in the methanol promotes the hydrolysis of the iron (III) 2-ethylhexanoate, which causes the spherical particles to harden. The iron-containing spheres can then be isolated by filtration. These spheres are the first ones reported to be made of 100% iron oxide and prepared without a binder. In the initial preparations, the spheres are 100 to 200 μm in diameter. Some problems remain to be resolved with this new method of preparation.

31 (DOE/PC/90289–T6) **Mild coal pretreatment to improve liquefaction reactivity: Quarterly technical progress report, March–May 1992.** Miller, R.L. Colorado School of Mines, Golden, CO (United States). Dept. of Chemical Engineering and Petroleum Refining. [1992]. 20p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG22-90PC90289. Order Number DE92040772. Source: OSTI; NTIS; GPO Dep.

This report describes work completed during the seventh quarter of a three year project to study the effects of mild chemical pretreatment on coal dissolution reactivity during low severity liquefaction or coal/oil coprocessing. The overall objective of this research is to elucidate changes in the chemical and physical structure of coal by pretreatment with methanol or other simple organic solvent and a trace amount of hydrochloric acid and to study the influence of these changes on coal dissolution reactivity. This work is part of a larger effort to develop a new coal liquefaction or coal/oil coprocessing scheme consisting of three main process steps : (1) mild pretreatment of the feed coal to enhance dissolution reactivity and dry the coal, (2) low severity thermal dissolution of the pretreated coal to obtain a very reactive coal-derived residual material amendable to upgrading, and (3) catalytic upgrading of the residual products to distillate liquids. Work this quarter continued to focus on analytical characterization of untreated and treated Wyodak subbituminous coal and Illinois No. 6 bituminous coal. Small angle x-ray scattering was used to study changes in surface morphology of pretreated coal samples. Results indicated that no significant changes in either surface area or pore size distribution occur in either coal as a result of treatment with reethanol and HCl. Thus, the reactivity enhancement observed with pretreated Wyodak and Illinois No. 6 coals cannot be attributed to increased surface area or pore size distribution.

32 (DOE/PC/90305–T8) **Probe molecule studies: Active species in alcohol synthesis: 7th quarterly report, April 1992–June 1992.** Blackmond, D.G.; Wender, I.; Oukaci, R.; Wang, J. Pittsburgh Univ., PA (United States). Dept. of Chemical and Petroleum Engineering. Jul 1992. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG22-90PC90305. Order Number DE93001274. Source: OSTI; NTIS; GPO Dep.

The goal of this research is to develop a better understanding of the mechanisms of formation of alcohols and other oxygenates from syngas over supported catalysts. Probe molecules will be added in situ during the reaction to help delineate reaction pathways and identify reaction intermediate species. The key of our study is to investigate how the species generated by these probe molecules interact with surface species present during oxygenate formation. (A) Co (5%) /Cu/ZnO/Al_2O_3 was prepared in order to obtain high rates of ethanol and propanol formation from CO hydrogenation. (B) The effect of CH_3NO_2 addition to the steady state CO hydrogenation over this Co(5%)/Cu/Zno/Al_2O_3 was investigated at 500 psi, 290°C, H_2:CO=2, and 7600 hr_{-1}. A simultaneous suppression of CH_3OH, C_2H_5OH, and 1-C_3H_7OH upon CH_3NO_2 addition was observed along with the formation of $(CH_3)_3N$. (C) C_2H_4 was also added as a probe molecule to the steady state CO hydrogenation over the same catalyst at the same condition. A significant increase in 1-propanol was observed upon C_2H_4 addition along with an equivalent decrease in methanol and dimethylether.

33 (DOE/PC/91040–T3) **Advanced direct liquefaction concepts for PETC generic units: Quarterly technical progress report, April 1992–June 1992.** Kentucky Univ., Lexington, KY (United States). Center for Applied Energy Research; Sandia National Labs., Albuquerque, NM (United States); Consolidation Coal Co., Pittsburgh, PA (United States); LDP Associates (United States). Aug 1992. 78p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-91PC91040. Order Number DE92041281. Source: OSTI; NTIS; GPO Dep.

CAER/UK: Detail coal and starting solvents from Wilsonville were analyzed to develop the data necessary to conduct process studies in the CO Pretreatment and Catalyst Evaluation segment of this program. A comparison of the solvent separation analysis with the distillation/separation used at Wilsonville showed that the residual solvent components contained a large amount of residual pentane soluble products. The ashy resid contained 3% iron and 400 ppM molybdenum. Although the iron content in the distillate and deashed resid was much less, namely about 200 ppM., the molybdenum concentrations in these fractions were not significantly reduced over the concentration in the ashy resid, i.e., 200 ppM in each. The pretreatment of coal with CO/H_2O in the presence of NaOH and Na_2CO_3 has been shown to give a product which is lower in oxygen content and higher in hydrogen content compared to the raw coal. The atomic H/C ratios of the H_2O-insolubles, THF

THE PAPER AND INK USED IN THE ORIGINAL PUBLICATION MAY AFFECT THE QUALITY OF THE MICROFORM EDITION

insolubles and the PA+A fractions of the products-together with the hydrogen consumption data suggested that the raw coal has been substantially depolymerized and hydrogenated via the WGS reaction during the pretreatment process. The extensive amount of molecular reconstruction that has occurred in the solid product was evident from the ease of solubilization of the product into pyridine. The result of the pretreatment process is a product which is highly reactive under hydroliquefaction conditions at 400°C. Reaction rates seem to be much faster than the raw coal, especially at shorter reaction times, providing the opportunity for major reductions in plant vessel sizes, and preliminary data has led us to believe that better efficiency in hydrogen utilization is achieved.

34 (DOE/PC/91041–T1) **Preconversion processing of bituminous coals: New directions to improved direct catalytic coal liquefaction: Quarterly report, April 1, 1992–June 30, 1992.** BCR National Lab., Pittsburgh, PA (United States). Aug 1992. 27p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-91PC91041. (BCRNL-L–1663). Order Number DE93000302. Source: OSTI; NTIS; GPO Dep.

A study of high-temperature soaking has been continued. Two high-volatile bituminous coals and three coal liquids were used. Large pyridine extractabilities of more than 70 wt% were obtained for aR cases. A better understanding Of the mechanism is important for the development of coal preconversion using the high-temperature soaking. To investigate the mechanism of the change in coal solubilization by high-temperature soaking, a simple soaking experiment was conducted. The extract from the Illinois No. 6 coal was treated in toluene at three different temperatures, and the treated samples were analyzed by coal swelling using the recently developed method. Furthermore, effects of soaking time, soaking temperature, soluble portions, and coal rank were examined by using actual coal liquids. Although a cross-linked, three-dimensional macromoleculer model has been widely accepted for the structure of coat it has previously been reported that significant portions (far more generally believed) of coal molecules are physically associated. It is known, as reviewed in that paper, that most portions of bituminous coal can be disintegrated in coal derived liquids and polycyclic aromatic hydrocarbons at 300–400°C (high-temperature soaking). It was proposed that electron donors and acceptors of low molecular mass contained in these materials substitute coal-coal complexes with charge-transfer interactions. This is physical dissociation of associated coal molecules. However, chemical reactions may occur at these temperatures.

35 (DOE/PC/91041–T2) **Preconversion processing of bituminous coals: New directions to improved direct catalytic coal liquefaction: Quarterly report, September 20, 1991–December 31, 1991.** BCR National Lab., Pittsburgh, PA (United States). Jul 1992. 26p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-91PC91041. (BCRNL-L–1657). Order Number DE93000731. Source: OSTI; NTIS; GPO Dep.

The main task of this quarter was to install reactors to conduct preconversion and liquefaction of coal. Coal and coal liquids were collected. The anaerobic chamber (Model 855-AC; Plas Labs, inc.) was procured and set up to store coal samples under an inert gas. Equipment to treat products was assembled, including Soxhlet extraction units, fractionation columns, a distillation column, and a rotary evaporator. Two gas chromatographs for analysis of gases and liquid were adjusted. Two reactor systems were installed for the experimental apparatus. One was Model 4576 high-temperature and high-pressure autoclave (Parr Instrument, 500°C and 5000 psi) (see Figure 1); the other was a 27 ml of microreactors. The autoclave was obtained from the manufacturer and assembled. The experimental set-up of microreactors are shown in Figure 2.

36 (DOE/PC/91041–T3) **Preconversion processing of bituminous coals: New directions to improved direct catalytic coal liquefaction: Quarterly report, January 1, 1992–March 31, 1992.** BCR National Lab., Pittsburgh, PA (United States). Jul 1992. 24p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-91PC91041. (BCRNL-L–1658). Order Number DE93000732. Source: OSTI; NTIS; GPO Dep.

A study of the high-temperature soaking started in this quarter, following the installation of reactors in the previous quarter. Two high-volatile bituminous coals and three coal liquids, which were identified in the previous report, were used. A cross-linked, three-dimensional macromolecular model has been widely accepted f or the structure of coal, but there is no direct evidence to prove this model. The conventional coal structure model has been recently re-examined by this investigator because of the importance of relatively strong intra- and intermolecular interactions in bituminous coals. It was reasonable to deduce that significant portions were physically associated after a study of multistep extractions, associative equilibria, the irreversibility and the dependence of coal concentration on solvent swelling, and consideration of the monophase concept. Physical dissociation which may be significant above 300°C should be utilized for the treatment before liquefaction. The high-temperature soaking in a recycle oil was proposed to dissociate coal complexes.

37 (DOE/PC/91043–T3) **An investigation of the role of water on retrograde/condensation reactions and enhanced liquefaction yields: Quarterly progress report, April 1, 1992–June 30, 1992.** Miknis, F.P. Western Research Inst., Laramie, WY (United States). Jul 1992. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-91PC91043. Order Number DE92040540. Source: OSTI; NTIS; GPO Dep.

The overall objectives of this work are to conduct research that will provide the basis for an improved liquefaction process, and to facilitate our understanding of those processes that occur when coals are initially dissolved. Changes in coal structure that occur during coal drying and steam pretreatments will be measured in order to determine what effect water has on retrograde/condensation reactions, and to determine the mechanism by which water enhances coal reactivity toward liquefaction. Different methods for coal drying will be investigated to determine if drying can be accomplished without destroying coal reactivity toward liquefaction, thereby making coal drying a relatively economical and efficient method for coal pretreatment. Coal drying methods will include conventional thermal drying, microwave drying, and chemical drying at low temperature. State-of-the-art solid-state nuclear magnetic resonance (NMR) techniques using combined rotation and multiple pulse spectroscopy (CRAMPS) and cross polarization with magic-angle spinning (CP/MAS) will be employed: (1) to measures changes in coal structure brought about by the different methods of drying and by low temperature oxidation, and (2) to obtain direct measurements of changes in the aromatic hydrogen-to-carbon ratio of the solid/semi-solid material formed or remaining during pretreatment and the initial stages of liquefaction. The aromatic hydrogen-to-carbon ratios are difficult, if not impossible, to measure without the use of solid-state NMR, and as a result this ratio will be used to monitor the retrograde/condensation reactions that take place during coal liquefaction in the presence and absence of steam and various inert gases.

38 (DOE/PC/91058–T1) **Rate enhancement for catalytic upgrading coal naphthas: Quarterly project report, January–March 1992.** Davis, B.H. Kentucky Univ., Lexington, KY (United States). Center for Applied Energy Research. 4 Aug 1992. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-91PC91058. Order Number DE92040904. Source: OSTI; NTIS; GPO Dep.

A naphtha derived from Illinois #6 coal at the Wilsonville, Alabama pilot plant was hydrotreated and the raw naphtha and the product of hydrotreatment were examined by means of gas chromatography combined with mass spectrometry. The results obtained are summarized in Table 1. A representative chromatogram with the major peaks numbered as identified in Table 1 is shown in Figure 1. Mass spectra were obtained at elution peaks for most peaks exceeding 0.3% of total area; the areas were obtained using flame ionization detection. Approximately 95% of naphtha components were eluted during the time span covered in Table 1 for both the treated and untreated naphtha. In hydrotreatment lower molecular weight hydrocarbons tended to become more abundant at the expense of later eluting (higher molecular weight) components. The proportions of straight-chain alkanes were probably not significantly altered by hydrotreatment; an apparent exception, n-heptane, may involve co-elution, a possibility to be tested by selected ion chromatography. Phenols were removed by hydrotreatment. Trace

amounts of aromatic amines were detected in raw naphtha but not in the product of hydrotreatment. Trace amounts of sulfur-containing components are known to be present in raw naphtha, but were not detected in any of the mass spectra of the peaks reported here. Selected ion chromatography will be used to test for the presence of specific sulfur-containing components.

39 (DOE/PC/91058–T2) **Rate enhancement for catalytic upgrading coal naphthas: Quarterly project report, October–December 1991.** Davis, B.H. Kentucky Univ., Lexington, KY (United States). Center for Applied Energy Research. 4 Aug 1992. 30p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-91PC91058. Order Number DE92040905. Source: OSTI; NTIS; GPO Dep.

The construction and shake-down operation of two tricklebed reactor systems was completed. A mobile framework was constructed to support the two experimental systems. These two experimental systems were operated to perform hydrotreatment experiments using commercial catalysts and a Ill #6 coal derived naphtha. Unsupported transition metal sulfides were prepared following the procedure published by Chianelli et al. Conventionally, the transition metal sulfide have been prepared at high temperature (above 400°C) by vapor-phase reaction of the halides with hydrogen sulfide or by direct contact of the compounds in a sealed tube. The product is usually highly crystalline, has a low surface area and is often nonstoichiometric and multiphase. The technique presented by Chianelli et al involves precipitation of the amorphous transition metal sulfide from a nonaqueous solution. The corresponding transition metal halide and a sulfide source, i.e. a lithium salt (Li_2S or LiHS) and ammonium compounds, are used. This procedure yields materials of intermediate surface area. Hydroxyl containing solvents (alcohols and carboxylic acids) are too reactive generally to be employed as a solvent. The solvent used in the preparation of the transition metal sulfides was usually either ethyl acetate or tetrahydrofuran.

40 (DOE/PC/91286–T3) **The role of catalyst precursor anions in coal gasification: Third quarterly report.** Abotsi, G.M.K. Clark Atlanta Univ., GA (United States). Research Center for Science and Technology. 28 Aug 1992. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG22-91PC91286. Order Number DE92041240. Source: OSTI; NTIS; GPO Dep.

The aims of the proposed project are to enrich our understanding of the roles of various aqueous soluble catalyst precursor anions on the surface electrical properties of coal and to ascertain the influence of the surface charge on the adsorption, dispersion, and activities of calcium and potassium. These goals will be achieved by impregnating a North Dakota lignite (PSOC 1482) and its demineralized derivative with calcium or potassium catalyst precursors containing acetate (CH_3COO^-), chloride (Cl^-), nitrate (NO_3^-), sulfate (SO_4^{2-}), and carbonate (CO_3^{2-}) anions. Catalyst loading will be conducted under well-controlled conditions of solution pH and ionic strength. In the last quarter, the surface charge properties of the coal was determined as a function of acetate (CH_3COO^-), chloride (Cl^-), nitrate (NO^{3-}), carbonate (CO_3^{2-}) or sulfate (SO_4^{2-})concentration using the respective potassium salts of these anions. In general, low anion concentrations (10^{-3} or 10^{-2} mol/L) had little effect on the zeta potentials of the coals. However, the surface charge densities of the coal become less negative at 10-1 mol/L of the nitrate, carbonate or sulfate anions. These trends suggest that the surface charge density of the coal is controlled by the adsorption of potassium ions (K^+) onto the coal particles. The net negative charge on the coal panicles creates a repulsive force between the anions and the coal surface and prevents the anions from exerting any significant effect on the coal's electrokinetic properties.

41 (DOE/PC/91334–T71) **Mild pyrolysis of selectively oxidized coals: [Quarterly] technical report, March 1, 1992–May 31, 1992.** Hippo, E.J.; Palmer, S.R. Southern Illinois Univ., Carbondale, IL (United States). Dept. of Mechanical Engineering and Energy Processes. [1992]. 24p. Sponsored by USDOE, Washington, DC (United States); Illinois Dept. of Energy and Natural Resources, Springfield, IL (United States). DOE Contract FG22-91PC91334. Order Number DE93000521. Source: OSTI; NTIS; GPO Dep.

The primary objective of this study is to investigate the removal organic sulfur from selectively oxidized Illinois coals using mild thermal/chemical processes. Work completed this quarter primarily concerned the investigation of the desulfurization of the selectively oxidized coals using aqueous or alcoholic base mixtures. Model compound studies were initiated. Results were: Levels of desulfurization obtained in this study are at, or very close to, the 90% removal levels required for these coals to be in compliance with the Clean Air Act legislation; Up to 89.4% of the sulfur in the IBC 101 coal and 88.9% of the sulfur in the IBC 106 coal has been removed by combining selective oxidation and alcoholic/base reactions; Overall, selective oxidation pretreatment always led to a lower sulfur product than the untreated sample; Substantial enhancement in the reactivity of the sulfur in the coal has been achieved by the selective oxidation pretreatment; The highest levels of desulfurization obtained so far all involve bases as additives; The water/Na_2CO_3 combination, was superior than any of the aqueous hydroxide bases. Possible synergistic interactions between the alcohol and the base are suspected. Over 70% of the sulfur in the IBC 101 coal can be removed by performing vacuum pyrolysis on the selectively oxidized coal. Lower sulfur contents are obtained by lowing the pyrolysis pressure.

42 (DOE/PC/91334–T74) **Microbial strain improvement for organosulfur removal from coal: [Quarterly] technical report, March 1, 1992–May 31, 1992.** Kilbane, J.J. II. Institute of Gas Technology, Chicago, IL (United States). [1992]. 13p. Sponsored by USDOE, Washington, DC (United States); Illinois Dept. of Energy and Natural Resources, Springfield, IL (United States). DOE Contract FG22-91PC91334. Order Number DE93000523. Source: OSTI; NTIS; GPO Dep.

IGT has developed a microbial culture of Rhodococcus rhodochrous, designated as IGTS8, that is capable of specifically cleaving carbon-sulfur bonds in a range of organosulfur model compounds and is capable of removing organic sulfur from coal and petroleum without sacrificing the calorific value of the fuel. Although IGTS8 possesses the ability to specifically remove organic sulfur from coal, a major research need is to develop improved strains of microorganisms that possess higher levels of desulfurization activity and therefore will permit more favorable biodesulfurization process conditions: faster rates, more complete removal, and smaller reactor size. Strain improvement is the single most important aspect to the development of a practical coal desulfurization process and accordingly is the focus of research in this project. During the current quarter the screening of genomic libraries resulted in the detection of a clone that scored positively in the UV fluorescence spray plate assay; however, subsequent analysis failed to reveal the presence of a desulfurization gene. Preliminary results using subtractive hybridization to screen genomic libraries have been obtained but desulfurization genes have not yet been identified. In additional studies a gene encoding chloramphenicol resistance in Rhodococcus cultures has been cloned and the promoter region is currently being sequenced. This promoter will subsequently be used to obtain high levels of expression of desulfurization genes.

43 (DOE/PC/91334–T75) **The effects of moderate coal cleaning on the microbial removal of organic sulfur: [Quarterly] technical report, March 1, 1992–May 30, 1992.** Srivastava, V.J.; Kilbane, J.J. II. Institute of Gas Technology, Chicago, IL (United States). [1992]. 13p. Sponsored by USDOE, Washington, DC (United States); Illinois Dept. of Energy and Natural Resources, Springfield, IL (United States). DOE Contract FG22-91PC91334. Order Number DE93000524. Source: OSTI; NTIS; GPO Dep.

The purpose of this project is to investigate the possibilities of developing an integrated physical/chemical/microbial process for the precombustion removal of sulfur from coal. Microorganisms are capable of specifically cleaving carbon-sulfur bonds and removing substantial amounts of organic sulfur from coal; however, the removal of organic sulfur from coal by microorganisms is hampered by the fact that, as a solid substrate, it is difficult to bring microorganisms in contact with the entirety of a coal sample. This study will examine the suitability of physically/chemically treated coal

samples for subsequent biodesulfurization. During this quarter tests were performed involving prolonged (7 day) exposure to chemical comminution agents followed by explosive comminution. Combined chemical plus physical comminution yielded only minor differences between the chemical treatments tested (0.IN NAOH, methanol plus 0.IN NAOH, isopropanol plus 0.IN NAOH, and ammonia vapor) as regards particle size distribution. The densities of treated products varied somewhat with 0.IN NaOH and ammonia yielding the lowest and highest densities respectively. Biodesulfurization tests indicate that pre-grown IGTS8 biocatalysts can be used to desulfurized chemically treated IBC-107 coal.

44 (DOE/PC/91334–T85) **Protocols for the selective cleavage of carbon-sulfur bonds in coal: Technical report, March 1, 1992–May 30, 1992.** Bausch, M. (Southern Illinois Univ., Carbondale, IL (United States)). Illinois Dept. of Energy and Natural Resources, Springfield, IL (United States). [1992]. 24p. Sponsored by USDOE, Washington, DC (United States); Illinois Dept. of Energy and Natural Resources, Springfield, IL (United States). DOE Contract FG22-91PC91334. Order Number DE93000534. Source: OSTI; NTIS; GPO Dep.

Chemical reactions that result in carbon-sulfur bond cleavage are an essential aspect of any protocol designed to remove organic sulfur from coal. Unfortunately, several classes of reactions that lead to carbon-sulfur bond cleavage are not well understood. Planned in "Protocols for the Selective Cleavage of Carbon-Sulfur Bonds in Coal" are reactions in which organic sulfur-containing coal model compounds are subjected to different conditions of temperature, solvent mixtures and radiation. Summarized in this quarterly report are results of our investigations of the following topics: (a) the reactions of coal model compounds, namely, benzyl phenyl sulfide (BPS), diphenyl sulfide (hereafter referred to as phenylsulfide, PS) and dibenzothiophene (DBT) with various reagents (Lewis acid catalysts, radical initiators, electron acceptors) using different solvents and temperature in an attempt to maximize the degree of carbon-sulfur (C-S) bond cleavage; and (b) the results of photooxidation of coal model compounds under controlled conditions. Quantitative product analyses are presented in this report.

45 (DOE/PC/91334–T88) **Coal-derived promoters for the liquefaction of Illinois coal: Technical report, March 1–May 31, 1992.** Carty, R.H. (Institute of Gas Technology, Chicago, IL (United States)); Knight, R.A. Illinois Dept. of Energy and Natural Resources, Springfield, IL (United States). [1992]. 23p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG22-91PC91334. Order Number DE93000958. Source: OSTI; NTIS; GPO Dep.

The objective of this program is to investigate the use of liquids derived from coal either by mild gasification (MG) or supercritical extraction (SCE) to promote direct liquefaction of Illinois coal. Some organic heteroatomic compounds have been found to enhance liquefaction reactions. The approach taken in this two-year program is to use recently developed molecular probe techniques to assess the reactivity of three coal-derived liquids with respect to (A) H transfer rate, (B) C-C bond cleavage rate, (C) free radical flux, and (D) hydrocracking activity. With the IFFR liquid, the H transfer rate showed a mean increase of 21%, C-C bond cleavage selectivity increased by 34%, free radical flux showed a mean increase of 107%, and overall mean hydrocracking activity increased by 269%. For the ST/FBR liquid, H transfer rate increased 7%, C-C bond cleavage selectivity increased 27%, free radical flux increased 101%, and data indicated a 227% increase in hydrocracking activity. During the current quarter, the SCE liquid was characterized and tested. The H transfer rate did not increase, the mean free radical flux increased by 18%, and the hydrocracking activity showed a dramatic increase of 359%, which is higher than either the IFFR or ST/FBR liquids. The assessment of C-C bond cleavage with SCE is not yet completed. The SCE analysis showed much lower levels of phenols, cresols, and naphthalenes than the IFFR and ST/FBR liquids.

46 (DOE/PC/91334–T95) **Gasifier feed - Tailor-made from Illinois coals: [Quarterly] report, March 1, 1992–May 31, 1992.** Ehrlinger, H.P. III (Illinois State Geological Survey, Champaign, IL (United States)); Lytle, J.; Frost, R.R.; Lizzio, A.; Kohlenberger, L.; Brewer, K. Illinois State Geological Survey, Champaign, IL (United States). [1992]. 14p. Sponsored by USDOE, Washington, DC (United States); Illinois Dept. of Energy and Natural Resources, Springfield, IL (United States). DOE Contract FG22-91PC91334. Order Number DE93000948. Source: OSTI; NTIS; GPO Dep.

The main purpose of this project is to produce a feedstock from preparation plant fines from an Illinois coal that is ideal for a slurry fed, slagging, entrained-flow coal gasifier. The high sulfur content and high Btu value of Illinois coals are particularly advantageous in such a gasifier; preliminary calculations indicate that the increased cost of removing sulfur from the gas from a high sulfur coal is more than offset by the increased revenue from the sale of the elemental sulfur; additionally the high Btu Illinois coal concentrates more energy into the slurry of a given coal to water ratio. This project will bring the expertise of four organizations together to perform the various tasks. The Illinois Coal Association will help direct the project to be the most beneficial to the Illinois coal industry. DESTEC Energy, a wholly-owned subsidiary of Dow Chemical Company, will provide guidelines and test compatibility of the slurries developed for gasification feedstock. Williams Technology will provide their expertise in long distance slurry pumping, and test selected products for viscosity, pumpability, and handlability. The Illinois State Geological Survey will study methods for producing clean coal/water slurries from preparation plant wastes including the concentration of pyritic sulfur into the coal slurry to increase the revenue from elemental sulfur produced during gasification operations, and decrease the pyritic sulfur content of the waste streams. ISGS will also test the gasification reactivity of the coals. As reported earlier, a variety of possible samples of coal have been analyzed and the gasification performance evaluation reported. Additionally, commercial sized samples of -28 mesh x 100 mesh coal -100 x 0 coal were subjected to pumpability testing. Neither the coarse product nor the fine product by themselves proved to be good candidates for trouble free pumping, but the mix of the two proved to be a very acceptable product.

47 (DOE/PC/91334–T99) **Stabilization and/or regeneration of spent sorbents from coal gasification: [Quarterly] technical report, March 1, 1992–May 31, 1992.** Abbasian, J. (Institute of Gas Technology, Chicago, IL (United States)); Hill, A.H.; Wangerow, J.R. Illinois Dept. of Energy and Natural Resources, Springfield, IL (United States). [1992]. 13p. Sponsored by USDOE, Washington, DC (United States); Illinois Dept. of Energy and Natural Resources, Springfield, IL (United States). DOE Contract FG22-91PC91334. Order Number DE93000943. Source: OSTI; NTIS; GPO Dep.

The objective of this investigation is to determine the effects of SO_2 partial pressure and reaction temperature on the conversion of sulfide containing solid wastes from coal gasifiers to stable and environmentally acceptable calcium sulfate, while preventing the release of sulfur dioxide through undesirable side reactions during the stabilization step. An additional objective of this program is to investigate the use of the Spent Sorbent Regeneration Process (SSRP) to regenerate spent limestone, from a fluidized-bed gasifier with in-bed sulfur capture, for recycling to the gasifier. To achieve these objectives, selected samples of partially sulfided sorbents will be reacted with oxygen at a variety of operating conditions under sufficient $S0_2$ partial pressure to prevent release of sulfur from the solids during stabilization that reduces the overall sorbent utilization. Partially sulfided limestone will also be regenerated with water using the SSRP to produce calcium hydroxide and release sulfur as H_2S. The regenerated sorbent will be dewatered, dried and pelletized. The reactivity of the regenerated sorbent toward H_2S will also be determined.

48 (DOE/PC/91334–T101) **Development of novel copper-based sorbents for hot-gas cleanup: Technical report, March 1, 1992–May 31, 1992.** Abbasian, J. (Institute of Gas Technology, Chicago, IL (United States)); Hill, A.H.; Wangerow, J.R.; Flytzani-Stephanopoulos, M.; Bo, L.; Patel, C. Illinois Dept. of Energy and Natural Resources, Springfield, IL (United States). [1992]. 26p. Sponsored by USDOE, Washington, DC (United States); Illinois Dept. of Energy and Natural Resources, Springfield, IL (United States). DOE Contract FG22-91PC91334. Order Number DE93000941. Source: OSTI; NTIS; GPO Dep.

The objective of this investigation is to evaluate several novel copper-based binary oxides for their suitability as regenerable sorbents for hot gas cleanup application in the temperature range of 650° to 850°C. During this quarter cyclic sulfidation/regeneration tests of the sorbents Cu_2Cr-O and Cu-Ce-0 were conducted using different compositions of the feed gases to investigate the effects of H_20, H_2 and CO. These tests were conducted in a packed-bed microreactor at 850°C. The results of these tests showed that H_2 and CO (along with C02) had a significant effect on the H_2S prebreakthrough levels, whereas H_20 did not have an effect. The physical properties of the fresh and reacted samples of the Cu-2Cr-O and Cu-Ce-0 sorbents prepared in this program and used in the cyclic sulfidation/regeneration tests were also measured. In addition, sulfidation/regeneration tests were conducted using two commercial copper chromite sorbents (G-13 and G-89, United Catalyst, Inc.) and a zinc titanate sorbent (L-3014) in a one-inch fluidized-bed reactor at 650°C. The G-13 sorbent appears to have a much higher sulfur capacity than the G-89 sorbent.

49 (DOE/PC/91334–T102) **Desulfurization of hot fuel gas produced from high-chlorine Illinois coals: Technical report, March 1, 1992–May 31, 1992.** O'Brien, W.S. (Southern Illinois Univ., Carbondale, IL (United States)); Gupta, R.P. Illinois Dept. of Energy and Natural Resources, Springfield, IL (United States). [1992]. 20p. Sponsored by USDOE, Washington, DC (United States); Illinois Dept. of Energy and Natural Resources, Springfield, IL (United States). DOE Contract FG22-91PC91334. Order Number DE93000940. Source: OSTI; NTIS; GPO Dep.

New coal gasification processes are now being developed which can generate electricity with high thermal efficiency either in an integrated gasification combined cycle (IGCC) or in a fuel cell (MCFC). Both of these new coal-to-electricity pathways require that the coal-derived fuel gas be at a high temperature and be free of potential pollutants, such as sulfur compounds. Unfortunately, some high-sulfur Illinois coals also contain significant chlorine which converts into hydrogen chloride (HCl) in the coal-gas. This project investigates the effect of HCl, in concentrations typical of a gasifier fed by high-chlorine Illinois coals, on zinc-titanate sorbents that are currently being developed for H_2S and COS removal from hot coal gas. This study is designed to identify any deleterious changes in the sorbent caused by the HCl, both in absorptive operation and in the regeneration cycle, and will pave the way to modify the sorbent formulation or the process operating procedure to remove HCl along with the H_2S and COS from hot coal gas. This will negate any harmful consequences of utilizing high-chlorine Illinois coal in these processes. The work activity during the third quarter of this project involved the performance of the second block-set of experiments in the bench-scale fluidized-bed reactor. These experiments were designed to study the effect of HCl in the desulfurization of a low-Btu fuel gas. Nine single-cycle experiments were performed, at operating temperature of 538, 650, and 750°C, with HCl concentrations of 0, 200, and 800 ppMv. The presence of HCl in the coal gas significantly enhanced the desulfurization efficacy of the sorbent. A 10-cycle sulfidation-regeneration sequence is currently being performed at 650°C with 800 ppMv HCl in the simulated fuel gas to determine any adverse effects on the sorbent structure or its desulfurization capability.

50 (ECN-C–92-043) **Inventarisation of techniques for CO_2 removal from fuel gas or reformer gas.** Oudhuis, A.B.J. Netherlands Energy Research Foundation (ECN), Petten (Netherlands). Jul 1992. 28p. Contract VROM 651.893.01 160439. Order Number DE92557284. Source: OSTI; NTIS (US Sales Only).

A literature study into the gas separation processes for CO_2 removal from fuel gas or reformer gas was performed by the Netherlands Energy Research Foundation (ECN) on behalf of the Dutch Ministry of Housing, Planning and Environment (VROM) and the ECN energy research programme ENGINE (ENergy Generation In the Natural Environment). The result of this study is the selection of the most convenient technique for the specified cases of CO_2 removal from fuel gas or reformer gas. The fuel gas will be produced by coal gasification, while the reformer gas will be produced by reforming natural gas. Implementation of a CO-shift reactor will increase the efficiency of separation (increase of the CO_2 as well as the H_2 concentration). The resulting H_2-rich stream will be converted in a combined cycle. Chemical absorption, physical absorption, adsorption in a molecular sieve (PSA or Pressure Swing Adsorption) and membrane separation are possible techniques for CO_2 separation. The fact that the resulting CO_2 stream must have a purity of >95%, makes the chemical or physical absorption techniques most attractive. In the case of CO_2 removal from reformer gas, chemical absorption is favoured because of a CO_2 partial pressure lower than 5 bar. Activated MDEA (methyldiethanolamine) is the recommended CO_2 absorption technique, because it combines the selectivity of a chemical absorbent with the low energy requirement of a physical absorbent. In the case of CO_2 removal from fuel gas, physical absorption is favoured because of a CO_2 partial pressure higher than 5 bar. Selexol is the recommended CO_2 absorption technique, because of the low energy requirement and the possibility to selectively absorb CO_2 and H_2S. 6 figs., 22 refs., 1 app.

51 (ORNL/FMP–92/1) **Proceedings of the sixth annual conference on fossil energy materials: Fossil Energy AR and TD Materials Program.** Cole, N.C.; Judkins, R.R. (comps.). Oak Ridge National Lab., TN (United States). Jul 1992. 428p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. (CONF-9205123–: 6. annual fossil energy materials conference, Oak Ridge, TN (United States), 12-14 May 1992). Order Number DE93000504. Source: OSTI; NTIS; GPO Dep.

The Sixth Annual Conference on Fossil Energy Materials was held in Oak Ridge, Tennessee, on May 12–14, 1992. The meeting was sponsored by the US Department of Energy's Office of Fossil Energy through the Advanced Research and Technology Development (AR&TD) Materials Program, and ASM International. The objective of the AR&TD Materials Program is to conduct research and development on materials for longer-term fossil energy applications as well as for generic needs of various fossil fuel technologies. The management of the Program has been decentralized to the DOE Field Office, Oak Ridge with Oak Ridge National Laboratory (ORNL) as the technical support contractor. The research is performed by staff members at ORNL and by a substantial number of researchers at other national laboratories, universities, and in private industry. The work is divided into the following categories: (1) ceramics, (2) development and corrosion resistance of iron aluminide, advanced austenitic and chromium-niobium alloys, and (3) technology assessment and technology transfer. This conference is held each year to review the work on all of the projects of the Program. The agenda for the meeting is given in Appendix A, and a list of attendees is presented in Appendix B. ASM International cosponsored the conference, for which we are especially grateful.

52 (SAND–92-1989C) **Fine-particle iron catalysts: Testing program at Sandia National Laboratories.** Stohl, F.V. Sandia National Labs., Albuquerque, NM (United States). [1992]. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. (CONF-9210165–1: 9. AIST-NEDO/DOE-PETC joint technical meeting on coal liquifation, San Francisco, CA (United States), 12-15 Oct 1992). Order Number DE92040966. Source: OSTI; NTIS; GPO Dep.

The use of fine-particle size (<40 nm) unsupported catalysts in the solubilization step of direct coal liquefaction may result in improved economics for direct coal liquefaction due to the possible enhanced yields of desired products, the potential for decreasing reaction severity, and the possibility of using less supported catalyst during liquefaction processing. To guide the research and development efforts for these new unsupported catalysts, it is necessary to evaluate the catalyst performance under standard test conditions so that the impacts of catalyst formulations from different laboratories can be compared. The objectives of this work are to develop standard coal liquefaction test procedures and to perform the testing of the novel fine-particle size liquefaction catalysts being developed in the DOE/PETC AR Coal Liquefaction program. As part of this effort, we have developed a factorial experimental design to enable evaluation of the catalysts over ranges of temperature, time, and catalyst loading. The standard test procedure uses DECS-17 Blind Canyon Coal and 9,10-dihydrophenanthrene (DHP) as the hydrogen donor. Product analyses include tetrahydrofuran (THF) conversion, heptane conversion, DHP recovery, and gas

analyses. THF and heptane insoluble materials are analyzed for carbon, hydrogen, nitrogen and sulfur contents. Testing is performed in batch microautoclave reactors. The experimental design and test procedures are being evaluated using −100 mesh pyrite as a catalyst.

53 (SRI–2847-9) **Fundamental studies of coal liquefaction solvents: Quarterly report No. 3, April 1–July 1, 1992.** Ross, D.S. SRI International, Menlo Park, CA (United States). Chemistry Lab. 1 Aug 1992. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-91PC91053. Order Number DE93000919. Source: OSTI; NTIS; GPO Dep.

We have conducted some initial "get acquainted" runs with Wyodak coal and water. These runs allowed us to learn the basic features of its operation, and to make any necessary refinements. Some trial and error adjustments in the imaging system were required initially, and there are likely some additional improvements to be made. The two most recent runs were satisfactory. The cell was heated at around 10°C/min. We appear to see the evolution of tar from the coal particles at temperatures in the range 150°–300°C, although some upgrading in the image sharpness is required for a full evaluation of the process. Above 300°C the process subsides, and at around 3500 the optical qualities of water deteriorate as the medium approaches its critical temperature (374°C). Image becomes chaotic, although for moments at a time some of the particles can be seen. The coal does not appear to be affected by the critical nature of the medium. The image returns at around 400°C, and to 450° little change is seen. We are able to discern particles down to about 5μ in diameter. Brownian motion of the particles is apparent from around 150° to 300°C. At that point the motion ceases, presumably because the density of the medium falls substantially from that point on with increasing temperature.

0105 Products and By-Products

54 (NEDO-P–9115) **Study on possibility of the system introducing coalbed methane source.** New Energy and Industrial Technology Development Organization, Tokyo (Japan). Mar 1992. 117p. (In Japanese). Sponsored by New Energy and Industrial Technology Development Organization, Tokyo (Japan). Order Number DE93723967. Source: OSTI; NTIS.

Studies are made on optimization of the system for converting coalbed methane (CBM) to methanol in its producing area and transporting it to Japan. CBM is a gas mainly with methane in the coal layer, CBM Of 24 trillion m_3 exists in the U.S., Canada, China and Australia. The methanol production method using this CBM as a raw material is the combined process mainly with a steam reforming process, but the gas phase fluidized bed process and the low temperature liquid phase process are promising as a future development technology. Japan's methanol supply/demand is 1.8 million tons in 1991, 95% of which are imported. Most of the CBM is used as chemical raw materials, and the use of it as gasoline additive MTBE will extend. Trial estimation including methanol production up to transportation to Japan is made. In case of a CBM price of 0.58 yen/10^3 kcal, its receiving price is 10-19 yen/kg. There is a possibility of converting methanol from the conventional natural gas to that from CBM used for chemical raw materials. Also as a fuel, CBM is on the same price level as LNG and has a possibility of commercialization. 29 refs., 24 figs., 46 tabs.

55 (DOE/PC/79901–T5) **Radiative properties of ash and slag: Tenth quarterly report, January 1, 1990–March 30, 1990.** Solomon, P.R.; Markham, J.R. Advanced Fuel Research, Inc., East Hartford, CT (United States). [1990]. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-87PC79901. Order Number DE92041110. Source: OSTI; NTIS; GPO Dep.

Thermal radiation plays a key role in the operation and efficiency of combustion systems, accounting for over 90% of the heat transfer. The analysis of radiative heat transfer in coal-fired boilers, combustion chambers and other energy systems requires accounting for the effects of inorganic deposits on bounding surfaces and of entrained particulates, such as pulverized coal, char, and fly-ash. These effects can be predicted; however, the accuracy in predicting the radiative properties of entrained pyrolysis (ash) and deposit layers (slag) is limited by inaccurate knowledge of the physical/chemical properties of the materials over a range of material temperatures and radiative wavelengths that is representative of conditions in practical combustion systems. The objective of this project is to make laboratory measurements of the radiative properties of extracted ash and slag deposit samples and compare to model predictions.

56 (DOE/PC/79901–T7) **Radiative properties of ash and slag: Eighth quarterly report, July 1, 1989–September 30, 1989.** Solomon, P.R.; Markham, J.R. Advanced Fuel Research, Inc., East Hartford, CT (United States). Oct 1989. 25p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-87PC79901. Order Number DE92041112. Source: OSTI; NTIS; GPO Dep.

Thermal radiation plays a key role in the operation and efficiency of combustion systems, accounting for over 90% of the heat transfer. The analysis of radiative heat transfer in coal-fired boilers, combustion chambers and other energy systems requires accounting for the effects of inorganic deposits on bounding surfaces and of entrained particulates, such as pulverized coal, char, and fly-ash. These effects can be predicted; however, the accuracy in predicting the radiative properties of entrained pyrolysis (ash) and deposit layers (slag) is limited by inaccurate knowledge of the physical/chemical properties of the materials over a range of material temperatures and radiative wavelengths that is representative of conditions in practical combustion systems. The objective of this project is to make laboratory measurements of the radiative properties of extracted ash and slag deposit samples. During this quarter, measurements were continued for fused, tintered and powdery deposits.

57 (DOE/PC/79903–T15) **Optical properties of flyash: Quarterly report, 1 January–31 March 1990.** Self, S.A. Stanford Univ., CA (United States). High Temperature Gasdynamics Lab. Apr 1990. 38p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-87PC79903. Order Number DE93001869. Source: OSTI; NTIS; GPO Dep.

In this research program, we have adopted the approach that by measuring fundamental properties (i.e, the complex refractive index, m) of the fly ash which participates in the radiation transfer, we can use well established theoretical principles (Mie theory) to compute the radiative properties of dispersions of fly ash as found in coal combustors. With this approach one can, understand the underlying principles that affect the radiative properties of an ash dispersion and more confidently predict how variations in the characteristics of the ash dispersion cause variations in its radiative properties. An important criterion in this approach is that the fly ash particles be spherical, homogeneous, and isotropic. Fortunately, fly ash particles are formed at high temperatures at which most of them are molten, leading primarily to spherical particles. Furthermore, one should expect that molten particles will be reasonably homogeneous and isotropic. On cooling, most fly ash particles form glassy spheres which are homogeneous and isotropic. Some ash particles form hollow shells (cenospheres) while others form as particles with "bubbles" or voids, but most fly ash particles are well approximated as homogeneous isotropic spheres. In the following sections we review some of the underlying principles that affect the radiative properties of fly ash dispersions and report on progress that has been made during the past quarter.

58 (DOE/PC/79903–T17) **Optical properties of flyash: Quarterly report, 1 April–30 June 1989.** Self, S.A. Stanford Univ., CA (United States). High Temperature Gasdynamics Lab. Jul 1989. 49p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-87PC79903. Order Number DE93001870. Source: OSTI; NTIS; GPO Dep.

The purpose of this task is to validate the whole approach adopted in this program. Specifically, this bench-scale experiment is intended to compare the measured optical/radiative properties of a dispersion of well characterized ash with those calculated on the basis of the known size/composition distribution using the correlation formulae relating the composition and complex refractive index

resulting from measurements on bulk samples of synthetic slag. Considerable thought has been given to the various possible approaches to satisfying the objectives of this task. Several experiments were done to guide our design of an apparatus for measuring the scattering and absorption properties of dispersions of flyash. As a result of these experiments, and from extensive prior experience in connection with research on electrostatic precipitation, it has been determined that there is no satisfactory way to satisfy the aims of this task using a gaseous dispersion of flyash because it is not possible to adequately disperse and deagglomerate flyash into a gas stream. Unless the ash is adequately dispersed, as it exists in the radiant boiler of a pulverized coal-fired combustion system, one cannot expect calculations, based on Mie calculations for a dispersion of spheres to properly agree with laboratory measurements. For these reasons, our design efforts are based on making measurements on a dispersion of flyash in liquid, for which our experience shows we can obtain stable, well-deagglomerated dispersions of ash. Because there is not single liquid which is adequately transparent over the wavelength range 1–12 μm, we plan to use a combination of three liquids, C Cl_4, C S_2 and bromoform to cover the full range. Windows of BaF_2 will be used to contain the liquid suspension in an absorption/scattering cell.

59 (DOE/PC/89757–9) **Thermodynamics and surface structure of coals: Quarterly report, October 1, 1991–December 31, 1991.** Glass, A.S.; Larsen, J.W.; Quay, D.M.; Roberts, J.E. Lehigh Univ., Bethlehem, PA (United States). Dept. of Chemistry. [1991]. 35p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-89PC89757. Order Number DE92040015. Source: OSTI; NTIS; GPO Dep.

NMR relaxation and shift reagents are being deposited on the surface of coals. The dipolar coupling of the unpaired electron spin of the relaxation agent and the carbon atom should significantly shorten the carbon T, which should broaden it away. We propose to record the NMR spectrum of a coal before and after deposition and subtract the spectra. The difference spectra will arise from the functionalities within approximately one nanometer of the surface and reveal the surface composition of the coal. In order to determine the surface concentration of the dysprosium in the coal, we are using x-ray photoelectron spectroscopy (XPS) also known as electron spectroscopy for chemical analysis (ESCA). XPS is a surface technique that can be used for the elucidation of chemical structure. The binding energy for each electron in each element is unique. The measurement of the binding energy in XPS allows the identification of the element and its oxidation state. The relative atomic concentrations of each element can also be determined using XPS spectra.

60 (DOE/PC/90284–7) **Molecular accessibility in solvent swelled coal: Quarterly report.** Kispert, L.D. Alabama Univ., University, AL (United States). Dept. of Chemistry. Aug 1992. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG22-90PC90284. Order Number DE93000900. Source: OSTI; NTIS; GPO Dep.

An EPR technique developed in this lab is being used to determine the pore size and number distribution changes after swelling the coal samples with various solvents. Stable nitroxide radical spin probes of different sizes, shapes and reactivity are dissolved in an appropriate solvent, the coal sample is added to the resulting solution, stirred over night at elevated temperature, filtered, washed with a nonswelling solvent to eliminate any spin probes that are not trapped in the pores and the spin concentration measured. Comparing these spin probe measurements to DRIFT data have shown that the relative number distribution of acidic functionalities can be accurately predicted by the spin probe method. The spin probe method has also been used to predict the increase in elongated voids in Pittsburgh No. 8 (APCS No. 4) upon swelling with pyridine in agreement with independent SANS data. NMR relaxation data shows that it is possible to deduce the pore (accessibility) distribution as a function of size (up to 6 nm). It has also been possible by variable temperature and ENDOR measurements to determine the presence of hydrogen bonding as a function of pore shape and size. The advantage of the EPR method is that it permits molecules of selected shape and size to be used as probes of accessible regions of the coal, thus providing information on the importance of molecular shape.

Results from recent UK chromium XAFS analysis of several coal and ash samples are reported. Illinois No. 6 parent coal, Illinois NO. 6 physically beneficiated coal, and two coals from the Penn State Coal Bank (DECS-2 and DECS-12), were found to contain chromium in the +3 oxidation state. No evidence for the carcinogenic and toxic +6 oxidation state (i.e., CrO_4^{-2}) was found. Ash samples were generated from each of these coals in a PSIT laboratory scale reactor at 1500°C and 7% oxygen. Subsequent XAFS analysis of these ash samples also identified only Cr+3 in the ash. As discussed further in Section 3, if the results of this study can be considered general for bituminous coals, then the absence of the (+6) chromate state in both the coal and the ash implies that the hazard posed by chromium in coal combustion is small, absent high concentrations of chromium in the ash (> 100 ppM). Of the two major oxidation states of chromium, the CrO_4^{-2} oxidation state can be both toxic and carcinogenic, whereas the Cr^{3+} oxidation state at such low concentration levels (< 100 ppM) does not pose a significant health risk. If the results of this study can be considered to be general, then the absence of the chromate state in both coal and combustion ash would imply that the hazard posed by chromium in coal utilization is minimal.

62 (DOE/PC/91334–T77) **Influence of sulfur in coals on char morphology and combustion: [Quarterly] technical report, March 1, 1992–May 31, 1992.** Marsh, H.; Crelling, J.C. Southern Illinois Univ., Carbondale, IL (United States). [1992]. 47p. Sponsored by USDOE, Washington, DC (United States); Illinois Dept. of Energy and Natural Resources, Springfield, IL (United States). DOE Contract FG22-91PC91334. Order Number DE93000526. Source: OSTI; NTIS; GPO Dep.

During coal pyrolysis, in applications such as in a utility boiler, sulfur which is present in the original coal is transferred to the resultant char, to be burnt (combusted) subsequently. The effect of sulfur on char reactivity during combustion is poorly understood and this study addresses the problem. Due to the complex nature of coal, initial experiments make use of organic model compounds which can be related to chars from coals. This approach allows for clear identification of the important parameters which influence reactivity, in this instance namely; phenolic resin concentration, sulfur and/or iron content. The addition of iron serves to mimic the effect of catalytic mineral matter in coals. The experimental approach involves the preparation of model compounds and the study of their gasification behavior, including surface characterization by adsorption techniques and microscopy. The equipment necessary to this study has been commissioned and progress has been made. Previous results indicated that increasing phenolic resin (resol) content led to greater yields and that carbons with less than 20 wt.% resol were optically anisotropic, whereas carbons with higher concentrations of resol were isotropic. Due to the high volatility of thiophene it was decided to incorporate sulfur into the model carbon structure by the addition of elemental sulfur and dibenzothiophene sulfone.

63 (DOE/PC/91334–T81) **Mass spectral study of organic sulfur in the polymeric matrix of coal: [Quarterly] technical report, March 1, 1992–May 31, 1992.** Hanley, L. Illinois Univ., Chicago, IL (United States). Dept. of Chemistry. [1992]. 14p. Sponsored by USDOE, Washington, DC (United States); Illinois Dept. of Energy and Natural Resources, Springfield, IL (United States). DOE Contract FG22-91PC91334. Order Number DE93000530. Source: OSTI; NTIS; GPO Dep.

This report reviews the progress of a project to examine the chemical environment of organic sulfur in the polymeric matrix of Illinois coal by laser desorption ion trap mass spectrometry. This project is developing new laser desorption-ionization schemes for

coal which preserve the polymeric matrix. It will compare mass spectra of whole coal with its separated macerals and will analyze organic sulfur in the polymeric matrix of coal by collision induced dissociation and high resolution mass spectrometry. A laser desorption mass spectrum of a trial polymer is shown to demonstrate the advantage of this technique over more traditional electron impact ionization mass spectrometry. A preliminary mass spectrum of THF extracts from a Herrin No. 6 (IBC 101) coal sample is also shown which contains low molecular weight fragments in the 60 to 250 amu region. Efforts are presently underway to obtain higher molecular weight ions from coal samples by optimizing the laser desorption conditions, improving the solvent extraction technique, and extending the mass range of the ion trap.

64 (DOE/PC/91334–T82) **Vhf EPR analysis of organic sulfur in coal: [Quarterly] technical report, March 1, 1992–May 31, 1992.** Clarkson, R.B.; Belford, R.L. Illinois Univ., Urbana, IL (United States). [1992]. 17p. Sponsored by USDOE, Washington, DC (United States); Illinois Dept. of Energy and Natural Resources, Springfield, IL (United States). DOE Contract FG22-91PC91334. Order Number DE93000531. Source: OSTI; NTIS; GPO Dep.

This third quarterly report of the project's first year reports that, consonant with our research goals, we have refined the quantitative measurement of organic sulfur in coals, and extended this technique to analysis of treated and desulfurized coals, using either low temperature pyrolysis in our labs, or other techniques as supplied by DOE-PETC. The evolution of the central carbon and downfield sulfur peak amplitudes vs pyrolysis temperature support both the hypothesis of increase in aromatic carbon radicals and the evolution of some sulfur, even at low temperatures. The examination of evacuation effects, and differentiation of species by microwave power saturation levels and second derivative W-band detection also continued. Finally, model sulfur-containing carbonaceous solids – chars from sucrose or cellulose, and various model sulfur compounds (elemental, mono- and di-thiophenic, and thiosulfidal) - are under development. Already, the W-band spectra of some of these char models show striking similarities to those of whole and treated coals. The further development of these models in conjunction with all other aspects of this program are progressing steadily toward the goal of better quantitative md qualitative differentiation of aromatic heteroatoms in coal.

65 (DOE/PC/91334–T83) **Analysis of organic sulfur and nitrogen in coal via tandem degradation methods: [Quarterly] technical report, 1 March–31 May 1992.** Kruge, M.A.; Palmer, S.R.; Baudet, N. Southern Illinois Univ., Carbondale, IL (United States). Dept. of Geology. [1992]. 26p. Sponsored by USDOE, Washington, DC (United States); Illinois Dept. of Energy and Natural Resources, Springfield, IL (United States). DOE Contract FG22-91PC91334. Order Number DE93000532. Source: OSTI; NTIS; GPO Dep.

Sporinite, vitrinite and semi-fusinite single macerals were separated from the IBC 101 coal by the density gradient technique. In addition, a gel permeation chromatography (GPC) system was assembled and the GPC column calibrated with four polystyrene molecular weight standards. A variety of sulfur compounds were identified in the dichromate oxidation products of the IBC 101 coal, including a thiazole and isomers of C2-, C3- and C4-alkyl thiophene carboxylic acids. Precise agreement between GC-MS and FPD chromatograms were obtained for these compounds. These compounds probably originated as short alkyl chains on exterior portions of the original peat macromolecular structures and were sulfurized by H_2S shortly after burial. Thus the dichromate oxidation appears useful for the characterization of sulfur compounds. Unfortunately, this treatment yields only small amounts of products, but the reaction is relatively mild. On the other hand the peroxyacetic acid gives a very good yield in only a single step, but seems to be very degradative. It was difficult to isolate the products after lithium aluminum hydride reduction of oxidation products. It is believed that this is due to the formation of polyalcohols from polycarboxyl compounds. However polyalcohols were successfully converted to their parent hydrocarbons by the LAH reduction of tosylate intermediates. This allows for much easier separation and characterization and leads to enhanced elucidation of coal structures. To test the hypothesis that asphaltenes are similar in structure to their parent coal, IBC101 asphaltenes and the extracted coal were subjected to PAA oxidation and analytical pyrolysis. The PAA products as well as the pyrolysates show very good correlation. This indicates a very strong relationship between the organic structure of the coal and that of the asphaltenes derived from them.

66 (DOE/PC/91334–T86) **Characterization of the surface properties of Illinois basin coals: Technical report, March 1, 1992–May 31, 1992.** Demir, I. (Illinois State Geological Survey, Champaign, IL (United States)); Harvey, R.D.; Lizzio, A.A. Illinois Dept. of Energy and Natural Resources, Springfield, IL (United States). [1992]. 24p. Sponsored by USDOE, Washington, DC (United States); Illinois Dept. of Energy and Natural Resources, Springfield, IL (United States). DOE Contract FG22-91PC91334. Order Number DE93000535. Source: OSTI; NTIS; GPO Dep.

The main objective of this project is to characterize the surface properties (surface area, pore size distribution, surface charge, and surface chemical structure) of eight coals in the Illinois Basin Coal Sample Program (IBCSP), and explore statistical relationships between surface properties and other coal characteristics. We completed analyses of -100 and -400 mesh, unoxidized IBCSP coals for surface area and pore volume distribution. Two thirds or more of the measured surface area of the samples are derived from the micropores (3.5-20 Å). The mesopore surface areas of IBC-101, IBC-102, and IBC-107 coals are higher than the other coals, and the mesopore surface area of the IBC-103 coal is the smallest among all the coals tested. The pore volume in pores less than about 1800 Å in diameter varies about five-fold among the samples. The differences between the samples suggest that these coals may show different physical-chemical behavior during various processes involving preparation and utilization of coal. Statistical analyses of the measured and other available coal properties indicate that the micropore surface area correlates positively with carbon content and vitrinite reflectance and negatively with volatile matter. and hydrogen content of the coal. The mesopore surface area correlates negatively with carbon content but positively with oxygen and hydrogen contents of the coal. The statistical correlations can be used to predict one parameter from another one.

67 (DOE/PC/91334–T87) **Graphic values for some organic constituents of beneficiated coal samples: Technical report, March 1, 1992–May 31, 1992.** Kohlenberber, L.B. (Illinois State Geological Survey, Champaign, IL (United States)); Lytle, J.M.; Kruse, C.W.; Chaven, C. Illinois Dept. of Energy and Natural Resources, Springfield, IL (United States). [1992]. 20p. Sponsored by USDOE, Washington, DC (United States); Illinois Dept. of Energy and Natural Resources, Springfield, IL (United States). DOE Contract FG22-91PC91334. Order Number DE93000536. Source: OSTI; NTIS; GPO Dep.

Graphic techniques exist which can accurately predict values for calorific value, organic sulfur, and several other constituents of the organic portion of beneficiated coal sample fractions. These techniques also permit a determination of coal rank to be made without the use of approximations required in the standard procedure. In beneficiation studies, plots of the calorific value of each fraction vs its ash content invariably produce straight lines. The Y axis intercept is the mineral-matter-free Btu value used (on the moist basis) to determine coal rank and the X axis intercept is a value we will call "maximum ash." These two constants permit us to calculate all future Btu values of fractions of this coal from the ash, alone. Plots of organic sulfur vs ash sometimes produce lines which are straight and at other times curved. In any event, they can be used to read off values of organic sulfur corresponding to a particular ash value in lieu of analyses. When all values truly represent only organic sulfur, the X axis intercept must occur at the same maximum ash value obtained from the Btu/ash curve. When the line is straight, the Y axis intercept is the mineral-matter-free organic sulfur, and all future organic sulfur values may be calculated from these 2 constants and the ash. Fractions of IBC-101 with varying ash contents were produced by froth flotation. The various fractions were analyzed by the coal analysis laboratory and the particular data type was plotted in each case vs the individual ash content of each fraction, using Lotus 123 and Freelance software packages. Such plots for calorific value and organic sulfur have, so far, been discussed in the second quarterly report. A comparison of the

graphic mineral matter value with the usual one calculated from the Parr approximation was also discussed in that report. In this third quarterly report we examine the curves for volatiles, fixed carbon, total carbon, total hydrogen, and nitrogen vs ash.

68 (DOE/PC/91334–T92) **Clean, premium-quality chars: Demineralized and carbon enriched: Quarterly report, March 1, 1992–May 31, 1992.** Smith, G.V. (Southern Illinois Univ., Carbondale, IL (United States)); Malhotra, V.M.; Wiltowski, T. Illinois Dept. of Energy and Natural Resources, Springfield, IL (United States). [1992]. 34p. Sponsored by USDOE, Washington, DC (United States); Illinois Dept. of Energy and Natural Resources, Springfield, IL (United States). DOE Contract FG22-91PC91334. Order Number DE93000951. Source: OSTI; NTIS; GPO Dep.

The effect of preoxidation on the interaction of methane and helium with IBC-102 coal samples ($\leq$ 2 mg) has been investigated in a thermogravimetric reactor at 20°C–650°C. The results show that the sample preoxidized at 80° C for 2 hr shows increased reactivity with both methane and He. Also, coal mixed with Camontmorillonite and preoxidized at 80°C exhibits the highest rate of devolatilization. Preoxidation of clean IBC-102 coal results in reactivity enhancement only under CH_4. This higher reactivity may be attributed to the oxidation of crude fractions present on the coal surface which may serve as a catalyst in methane interaction with coal. Differential Scanning Calorimetry (DSC) experiments show that kaolinite is effective agent for increasing yields of chars from IBC-102. Also, the clean coal (obtained by the selective-bitumen agglomeration process) shows enhanced weight loss in reaction with He. However, preoxidation of this coal increases the char yields. ISDR-FTIR results suggest that thermal decomposition of coal either increases $-CH_3$ content in char or alters the physical structure of $-CH_3$.

69 (NEDO-P–9113) **Survey on a new development of coal utilization technology in the coal science field. (2).** New Energy and Industrial Technology Development Organization, Tokyo (Japan). Mar 1992. 118p. (In Japanese). Sponsored by New Energy and Industrial Technology Development Organization, Tokyo (Japan). Order Number DE93723965. Source: OSTI; NTIS.

The paper examines the literature on molecular structure of coal, dynamic change of coal structure and catalyst in coal conversion process and considers the future molecular science and the trend of conversion process design based on it. Carbon of solid coal is quantified by bounding state by ^{13}C-NMR analysis, and covalent bond connecting aromatic clusters is estimated. The data obtained are compared with coal pyrolysis product distributions. It is necessary to continue to minimize and grasp the structure change by release of the covalent bond. To pursue the coal structure in the progress of pyrolysis is a fundamental for pyrolysis design. The change in the coal structure is caused by change/decomposition of coal functional groups, liberation of the polymer cross link, disconnection of the covalent bond. Coprocessing of coal and heavy oil is now under study mainly in the U.S. Heavy oil is expected to act as solvent and hydrogen donor solvent. The catalyst, which is to be disposable, is aimed at strengthening of the function by high dispersion in gasification, liquefaction and pyrolysis and at decrease of the amount to be used. 103 refs., 67 figs., 53 tabs.

70 (VTT-SYMP–134, pp. 101-115) **Rheological properties of wet peat.** Rautalin, A. (Technical Research Centre of Finland, Espoo (Finland). Lab. of Fuel and Process Technology); Thun, R.; Wilen, C. Technical Research Centre of Finland, Espoo (Finland). 1992. (CONF-9110428–: Conference on artificial dewatering of peat, Jyvaeskylae (Finland), 15-16 Oct 1991). In *Artificial dewatering of peat.* 149p. Order Number DE93721607. Source: OSTI; NTIS.

At Technical Research Centre of Finland alternative ways of overcoming flow problems with wet peat have been studied using mechanical maceration with and without chemical additives. The effect of various treatments on internal friction, cohesion, bulk density, shear strength and other flow-related properties has been investigated. Ring shear cells and purpose-built viscosimeters have been used for the determination of rheological characteristics of wet peat mass samples of varying moisture contents. The first results indicate that flow problems can be overcome by choosing proper treatment methods. As a consequence of alterations in the porous structure and rheological state of wet peat mass, decisively smaller pumping or driving forces are required in pipe transports.

71 (ANL/CP–75263) **A chemical kinetic model for NO_x removal in an aqueous scrubber system using the additive Fe[II]·EDTA.** Mendelsohn, M.H.; Livengood, C.D. Argonne National Lab., IL (United States). [1992]. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-920808–9: American Institute of Chemical Engineers (AIChE) summer national meeting, Minneapolis, MN (United States), 9-12 Aug 1992). Order Number DE92040750. Source: OSTI; NTIS; GPO Dep.

Addition of the metal chelate, ferrous· ethylenediaminetetraacetate anion ($Fe[II]\cdot EDTA^{2-}$), has been shown to increase the amount of gaseous nitrogen oxides absorbed from a gas stream containing sulfur dioxide, where an aqueous scrubbing process is used to treat the gas. Recently, we published data on improved systems for NO_x removal that incorporate an antioxidant and/or reducing agent (A/R) in the process along with the Fe[H]·EDTA. The purpose of the A/R is to maintain the highest possible concentration of iron in the +2 form. The major mechanism for NO removal is believed to be the equilibrium reaction of Fe[II]·EDTA with dissolved NO to form a Fe[II]·EDTA·NO complex. It has been shown that both sulfite and bisulfite anions can react with Fe[II]·EDTA·NO to regenerate Fe[II]·EDTA and other products. In a complex system, other oxidation and reduction mechanisms are also possible. We have chosen, therefore, to approach this problem empirically by fitting our experimental data to a model containing at most three kinetic terms, chosen from among the following: a baseline removal rate, which is equivalent to the rate of reaction of Fe[II]·EDTA with nitric oxide; a regeneration rate, which is equivalent to decomposition of the Fe[II]·EDTA·NO complex to Fe[II]·EDTA; an oxidation rate, which is a combined rate for all possible oxidation reactions involving Fe[II]·EDTA; and a reduction rate, which is a combined rate for all possible reduction reactions involving ferric-EDTA in the system.

72 (ANL/CP–75598) **Studies of waste produced in pilot-plant testing using Fe[II]·EDTA and magnesium-enhanced lime for combined SO_2/NO_x removal.** Mendelsohn, M.H. (Argonne National Lab., IL (United States)); Livengood, C.D.; Carlson, W.S.; Tutokey, S. Argonne National Lab., IL (United States); Dravo Lime Co., Pittsburgh, PA (United States). [1992]. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-921037–4: 9. annual international Pittsburgh coal conference, Pittsburgh, PA (United States), 12-16 Oct 1992). Order Number DE92041101. Source: OSTI; NTIS; GPO Dep.

A pilot-plant-scale study of combined sulfur dioxide/nitrogen oxides removal has been performed by the Dravo Lime Company at the Cincinnati Gas & Electric Company's Miami Fort Station in North Bend, Ohio. This study used Dravo's patented Thiosorbic® lime process along with Argonne National Laboratory's (ANL's) patented ARGONOX ferrous·ethylenediaminetetraacetate anion (Fe(II)·EDTA) additive. For approximately nine months, scrubbing tests were collected and waste samples were collected. Waste testing at ANL involved two types of long-term chemical stability experiments. In one test, the gas-phase composition above several different samples was studied as a function of time. Significant changes were noted for both oxygen (0_2) and carbon dioxide (CO_2) gases. The other experiment involved solid-phase leaching and testing of gases the leachate for total nitrogen and for some nitrogen-containing species. Several types of tests were performed by the Dravo Lime Company. Particle size and shape of the solids were determined. Elemental analyses were performed using x-ray fluorescence, and moisture and residual EDTA were determined. Tests were conducted to determine if the waste solids could be stabilized using current treatment technology for stabilizing flue-gas desulfurization (FGD) solids. Tests of stabilization were conducted with addition of various amounts of fly ash and lime. Results showed the solids were easily stabilized. The US EPA Toxicity Characteristic Leaching Procedure (TCLP) and toxicity tests using

Daphnia simplex and fat-head minnows were performed on solids both before and after stabilization. The TCLP results after stabilization were well within acceptable limits for heavy metals.

73 (DOE/PC/81004–T4) **Proof-of-concept testing of fluidized-bed copper oxide process: Phase 4, Conceptual design and economic evaluation: Technical progress report No. 4-2, October 1991–March 1992.** Gala, H.B. UOP, Inc., Des Plaines, IL (United States). [1992]. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-85PC81004. Order Number DE92041292. Source: OSTI; NTIS; GPO Dep.

The objective of Phase IV of the contract is to design a conceptual flue gas treating unit based on the fluidized-bed copper oxide (FBCO) process for a new coal-fired 500 MW(e) power plant. A technical and economic evaluation of the FBCO process that is based on the conceptual design will also be completed. The scope of the work during this reporting period was limited to Task 4.0, Proposal review and negotiations, and Task 4.1, Definition of design basis. In the revised Statement of Work (SO/At) for Phase IV, a cold-circulation dense-phase testing of the sorbent material is proposed. Presently, UOP does not manufacture the sorbents, SOX-3 and SOX-4, that were used in the life-cycle testing of the fluidized-bed copper oxide unit at PETC. So as an alternative to the sorbent, UOP proposed that the alumina support be used in the cold-circulation tests. Under Task 4.1, the feasibility of using the support material was evaluated in a series of attrition tests conducted on the SOX-3 sorbent and the alumina support. The testing took place during this reporting period. The objective of these tests was to examine the relative strength of the two materials.

0109 Environmental Aspects

74 (DOE/PC/91334–T97) **High temperature corrosion during use of chlorine: Technical report, March 1, 1992–May 31, 1992.** McNallan, M. (Illinois Univ., Chicago, IL (United States)); Danyluk, S.; Indacochea, J.E. Illinois Dept. of Energy and Natural Resources, Springfield, IL (United States). [1992]. 38p. Sponsored by USDOE, Washington, DC (United States); Illinois Dept. of Energy and Natural Resources, Springfield, IL (United States). DOE Contract FG22-91PC91334. Order Number DE93000945. Source: OSTI; NTIS; GPO Dep.

The goal of this project is to characterize the role of chlorine in coal on the high temperature corrosion processes which can occur in coal combustion and conversion processes. The experience include laboratory tests performed in well-controlled high temperature environments and field tests in industrial coal fired boilers. Evaluation of samples of boiler tubes which have been recovered from boilers which used both high and low chlorine coals does not indicate that the higher chlorine levels are associated with accelerated corrosion of either water wall tubes or superheater tubes in pulverized coal boilers. Laboratory testing of metal coupons in combustion gas environments produced from low sulfur, high chlorine coal IBC-109 and high sulfur-low chlorine coal IBC-101 has been performed at 700 and 800°C. Initial results indicate that more overall corrosion is produced in the high sulfur environment than in the high chlorine environment. Internal attack in the highly alloyed metals alloy 800 and 310 stainless steel is accelerated by the presence of chlorine in the environment, but the level of chlorine required to produce this attack has not yet been determined. Further testing at other temperatures and gas compositions is in progress.

75 (GTK-TURVE–217) **The peat resources of Iitti and their potential use.** Maekilae, M.; Grundstroem, A. Geological Survey of Finland, Espoo (Finland). 1988. 103p. (In Finnish). Order Number DE93721515. Source: OSTI; NTIS.

Geological Survey of Finland investigated the quantity and quality of the industrially exploitable peatlands in the municipality of Iitti, southeastern Finland, during 1964, 1981 and 1985. Altogether 1708 hectares of peatland were studied. This area covers 2.9 % of the land area. The total peatland area suitable for fuel peat production is 669 hectares. Useful peat resources are 13.91 million m^3 in situ. The energy content equals to 5.76 million MWh as calculated for 50 % moisture content. The area suitable for horticultural peat production is 439 hectares, containing about 6.45 million m^3 of peat in situ. The average depth of peat deposits is 2.32 m, including 1.03 m of slightly humified surfical layer. The total amount of peat of the studied peatlands is 39.7 million m^3. Area deeper than 2 m contains 32.1 million m^3 or 81 % of the total reserves including 17.3 million m^3 of better humified peat. 67 % of the peat layers are composed of Sphagnum, 32 % Carex and the rest Bryales peat. The average net calorific value of dry peat is 20.6 MJ/kg and 9.1 MJ/kg when calculated for 50 % moisture content. The average dry bulk density of the samples is 75 kg/m^3 in situ, moisture content 52.8 % of wet weight, pH-value 4.4, ash content 2.4 % and sulphur content 0.15 % on dry bases.

76 (DOE/CE/15307–T1) **A waterjet mining machine for use in room and pillar mining operations: [Final report].** Summers, D.A. Missouri Univ., Rolla, MO (United States). High Pressure Waterjet Lab. Jun 1990. 59p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG01-87CE15307. Order Number DE93002802. Source: OSTI; NTIS; GPO Dep.

A new mining machine is constructed for use in room and pillar mining operations. This machine uses the action of computer controlled, centrally located high pressure cutting lances to cut deep slots in a coal face. These slots stress relieve the coal ahead of the machine and outline blocks of coal. The movement forward of the machine then wedges up the lower block of coal. This wedging action is assisted by the gathering arms of the loader section of the machine, and by underlying oscillating waterjets which create a slot ahead of the loading wedge as it advances. Finally the top section of coal is brought down by the sequential advance of wedge faced roof support members, again assisted by the waterjet action from the central cutting arms. The machine is designed to overcome major disadvantages of existing room and pillar mining machines in regard to a reduction in respirable dust, the creation of an immediate roof support, and an increase in product size, with concomitant reduction in cleaning costs.

77 (ETDE/JP-mf–93723855) **Handbook for coal mine safety maintenance techniques. 7.: Control of underground environments.** Coal Mining Research Centre, Tokyo (Japan). Mar 1992 74p. (In Japanese). Order Number DE93723855. Source: OSTI; NTIS.

This is a report on controlling coal mine environments published as a part of the mine safety maintenance technique survey commissioned from the Ministry of International Trade and Industry in the fiscal year 1991. This volume discusses dust control and noise, and describes the latest experimental data and the current status of technical responses ranging from techniques of measuring dust concentration and noise to the control of measures therefor. Methods for dust control at sites, for example, may include coal wall water injection to wet a coal bed, water injected blasting with water injected into dynamite holes, hydraulic mining using high-pressure injection, or a suction-jet aeration system, all to prevent primarily dust generation. The method further calls for suppressing scattering and floating of dust using aeration and water spraying, and wearing dust preventive face masks during works subjected to temporary dust generation. Educating workers on dust has been legislated, and carried out in great detail. Controlling the work hours, work density, and performing health check-ups are also important measures. 30refs., 69 figs., 9 tabs.

78 (ETDE/JP-mf–93723856) **Handbook for coal mine safety maintenance techniques. 8.: Underground monitoring system.** Coal Mining Research Centre, Tokyo (Japan). Mar 1992 126p. (In Japanese). Order Number DE93723856. Source: OSTI; NTIS.

This is a report on coal mine safety maintenance techniques published as a part of the mine safety maintenance technique survey commissioned from the Ministry of International Trade and Industry in the fiscal year 1991. This volume relates to an

underground monitoring system, and describes the process of introduction, purpose and functions of the system in Chapter 1; the way a centralized monitoring system should specifically be in Chapter 2; and thereafter in each chapter the system of controlling mine entering workers, the information transmission method, the current status of the monitoring systems, and examples of the system implementation in different mines. Speaking of the centralized underground monitoring system, varieties of monitoring are performed from measuring and monitoring temperatures, quantity of air flow, gas and spring water amounts to operating conditions of face and other major facilities. Real-time remote centralized monitoring, measurement, and control are also carried out using freely such advanced technologies as using computers, industrial TV, and optical communications including out-of-tunnel devices such as belt conveyers. Not only data can be collected and stored, but also inductive radio transmission enables simultaneous conversations among all the points in a tunnel. 110 figs., 18 tabs.

79 (OY/PSTL-TIED–79) **Technological processes of field drying in optimum production of peat.** Fagan, H. Oulu Univ. (Finland). Research Inst. of Northern Finland. Dec 1991. 55p. Order Number DE93721622. Source: OSTI; NTIS.

Research projects are afoot in Finland, the USSR and elsewhere into the technological process of field drying in the optimum production of peat. For example, in Finland, there is presently the Optimiturve program which incorporates the efforts of the Technical Research Centre of Finland (VTT), the Research Institute of Northern Finland, Vapo Oy, etc. The optimum control and production of peat under field conditions is a diverse and complex are of study. It draws upon the experimental and theoretical studies of peat drying, production control and management, introduction and testing of new technological equipment and operations research, etc. To date solar drying of peat in bulk has proven to be the most economically feasible means of peat drying. Such drying is controlled by meteorological and technical factors. Meteorological factors are unalterable and have to be adjusted to accordingly. The technological factors are variable and allows for a measure of control. Henceforth, this report strives to combine the aforementioned knowledge in order to better regulate the peat production cycle. This process leads in the long run to an economic payoff. This report might be expedient in Finland, where researchers have stated that the output of milled peat falls far short of actual potential.

80 (CONF-9110369–, pp. 4-33) **On the stability in a 2D Hagen-Poiseuille resuspension flow.** Zhang, K. (City Univ. of New York, New York (United States)); Acrivos, A.; Schaflinger, U. USDOE Pittsburgh Energy Technology Center, PA (United States); National Science Foundation, Washington, DC (United States). [1991]. DOE Contract FG02-90ER14139. From 3. Joint Department of Energy/National Science Foundation (DOE/NSF) workshop on flow of particulates and fluids; Worcester, MA (United States); 22-24 Oct 1991. In *Joint DOE/NSF workshop on flow of particulates and fluids. Proceedings.* 396p. Order Number DE92012692. Source: OSTI; NTIS.

A linear stability analysis of a viscous resuspension flow, which develops from an initially well mixed suspension flowing along a two-dimensional channel, is described. The analysis is based on a two-fluid model in which the non-uniformity of the particle concentration distribution within the suspended layer is ignored. Numerical solutions to the relevant Orr-Sommerfeld equations for both temporal and spatial disturbance modes are obtained for the special case of a suspension of spherical particles in water and flowing in a duct having a vertical spacing of 2cm. It is found that the resuspension flow is convectively unstable and that the largest amplification occurs in the range of moderate stability Reynolds numbers. It is also shown that a reduction in the particle concentration in the feed suspension and/or an increase in the relative density ratio of the solid particles to that of the suspending fluid will enhance the instability of the interfacial mode.

Argonne National Laboratory (ANL) has developed two- and three-dimensional computer programs to predict hydrodynamics in complex fluid/solids systems including atmospheric and pressurized bubbling and circulating fluidized-bed combustors and gasifiers, concentrated suspension (slurry) piping systems and advanced particle-bed reactors for space-based applications, for example. The computer programs are based upon phenomenological mechanistic models and can predict frequency of bubble formation, bubble size and growth, bubble frequency and rise-velocity, solids volume fraction, gas and solids velocities and low dimension chaotic attracters. The results of these hydrodynamic calculations are used as inputs to mechanistic models to predict heat transfer and erosion and have been used to produce simplified models and guidelines to assist in design and scaling. An extensive coordinated effort involving industry, government, and university laboratory data has served to validate the various models. Babcock & Wilcox (B&W), in close collaboration with ANL, has developed the three dimensional FORCE2 computer program which is both transient as well as steady-state.

82 (DOE/MC/24207–2996) **Fundamental study on transient bubble (slug) behavior by characterizing transient forces of solid particles in fluidized beds: 1990 Annual report.** Kono, H.O. West Virginia Univ., Morgantown, WV (United States). Dept. of Chemical Engineering. Jan 1991. 119p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FC21-87MC24207. Order Number DE91002077. Source: OSTI; NTIS; GPO Dep.

The objective of this work is to recognize and interpret the signals of transient motion of bubbles (slugs) in fluidized beds by measuring and utilizing the signals of transient motion of solid particles. The two signals were measured simultaneously and also synchronized by using the TTL signal technique in the same fluidized beds. Also, a simultaneous study of video bubble image, transient force and pressure signals was initiated in a two dimensional fluidized bed. we successfully synchronized three signals so that the relationship of bubble behavior and force pressure signals can be identified and characterized. It has been found that bubble image can well be correlated to the transient force signai of solid particles under certain conditions in three dimensional fluidized beds. Accordingly, it seems that the transient force signals can significantly help understanding the transient motion of bubbles (slugs), which is important to design the fluidized beds.

83 (DOE/MC/24216–3122) **Atmospheric fluidized bed combustion advanced concept system: Final report.** Donlee Technologies, Inc., York, PA (United States). May 1992. 205p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC21-87MC24216. Order Number DE93000202. Source: OSTI; NTIS; GPO Dep.

DONLEE Technologies Inc. is developing with support of the US Department of Energy an advanced circulating fluidized bed technology known as the Vortex™ Fluidized Bed Combustor (VFBC). The unique feature of the VFBC is the injection of a significant portion of the combustion air into the cyclone. Since as much as one-half of the total combustion air is injected into the cyclone, the cross-sectional area of the circulating fluidized bed is considerably smaller than typical circulating fluidized beds. The technology is being developed for two applications: Industrial-scale boilers ranging from 20,000 to 100,000 pounds per hour steam generating capacity; and two-stage combustion in which a substoichiometric Vortex Fluidized Bed Combustor (2VFBC) or precombustor is used to generate a combustible gas for use primarily in boiler retrofit applications. This Level II analysis of these two applications indicates that both have merit. An industrial-scale VFBC boiler (60,000 lb/hr

of steam) is projected to be economically attractive with coal prices as high as $40 per ton and gas prices between $4 and $5 per thousand cubic feet. The payback time is between 3 and 4 years. The 2VFBC system was evaluated at three capacities of application: 20,000; 60,000 and 100,000 lb/hr of steam. The payback times for these three capacities are 4.5, 2.1 and 1.55 years, respectively. The 2VFBC has potential applications for retrofit of existing pulverized coal-fired boilers or as a new large (utility) boiler. Pressurized operation of the 2VFBC has considerable potential for combined cycle power generation applications. Experimental development of both applications is presented here to demonstrate the potential of these two technologies.

84 (DOE/PC/89769–T12) **Predictive models of circulating fluidized bed combustors: 12th technical progress report.** Gidaspow, D. Illinois Inst. of Tech., Chicago, IL (United States). Dept. of Chemical Engineering. Jul 1992. 44p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG22-89PC89769. Order Number DE93000938. Source: OSTI; NTIS; GPO Dep.

Steady flows influenced by walls cannot be described by inviscid models. Flows in circulating fluidized beds have significant wall effects. Particles in the form of clusters or layers can be seen to run down the walls. Hence modeling of circulating fluidized beds (CFB) without a viscosity is not possible. However, in interpreting Equations (8-1) and (8-2) it must be kept in mind that CFB or most other two phase flows are never in a true steady state. Then the viscosity in Equations (8-1) and (8-2) may not be the true fluid viscosity to be discussed next, but an Eddy type viscosity caused by two phase flow oscillations usually referred to as turbulence. In view of the transient nature of two-phase flow, the drag and the boundary layer thickness may not be proportional to the square root of the intrinsic viscosity but depend upon it to a much smaller extent. As another example, liquid-solid flow and settling of colloidal particles in a lamella electrosettler the settling process is only moderately affected by viscosity. Inviscid flow with settling is a good first approximation to this electric field driven process. The physical meaning of the particulate phase viscosity is described in detail in the chapter on kinetic theory. Here the conventional derivation resented in single phase fluid mechanics is generalized to multiphase flow.

85 (DOE/PC/90169–T5) **Coal desulfurization in a rotary kiln combustor: Quarterly report No. 1, April 16, 1990–July 15, 1990.** Cobb, J.T. Jr. BCR National Lab., Pittsburgh, PA (United States). 15 Aug 1990. 108p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG22-90PC90169. Order Number DE92041280. Source: OSTI; NTIS; GPO Dep.

BCR National Laboratory (BCRNL) has initiated a project aimed at evaluating the technical and economic feasibility of using a rotary kiln, suitably modified, to burn Pennsylvania anthracite wastes, co-fired with high-sulfur bituminous coal. Limestone will be injected into the kiln for sulfur control, to determine whether high sulfur capture levels can be achieved with high sorbent utilization. The principal objectives of this work are: (1) to prove the feasibility of burning anthracite refuse, with co-firing of high-sulfur bituminous coal and with limestone injection for sulfur emissions control, in a rotary kiln fitted with a Universal Energy International (UEI) air injector system; (2) to determine the emissions levels of SO_x and NO_x and specifically to identify the Ca/S ratios that are required to meet New Source Performance Standards; (3) to evaluate the technical and economic merits of a commercial rotary kiln combustor in comparison to fluidized bed combustors; and, (4) to ascertain the need for further work, including additional combustion tests, prior to commercial application, and to recommend accordingly a detailed program towards this end.

86 (DOE/PC/90310–T7) **Combustion of dense streams of coal particles: Quarterly progress report No. 7, February 29, 1991–May 28, 1992.** Annamalai, K. Texas A and M Univ., College Station, TX (United States). Dept. of Mechanical Engineering. 17 Jul 1992. 46p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG22-90PC90310. Order Number DE92040773. Source: OSTI; NTIS; GPO Dep.

Part III of the report contains the modeling results on a cylindrical cloud of char particles. It shows a monotonic increase in ignition time with increased cloud denseness which is in contrast with a minimum in ignition time for coal clouds. It is interesting to note that clouds remain essentially at uniform and hence a plot was made on cloud burn rate vs 1/T where T is temperature of any particle inside the cloud in order to determine the zones of reactions (Fig. 8 of Part III) i.e., cylindrical cloud is analogous to a large porous cylinder. As expected at low temperatures the plot is linear. However the denser cloud reaches diffusion controlled combustion somewhat at lower temperatures than a dilute cloud due to oxygen deficiency. These results are reported in Part II of our review article.

87 (DOE/PC/91161–T1) **The development of a coal-fired combustion system for industrial process heating applications: Quarterly technical progress report, January 1992–March 1992.** Vortec Corp., Collegeville, PA (United States). 16 Jul 1992. 44p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-91PC91161. Order Number DE93000306. Source: OSTI; NTIS; GPO Dep.

PETC has implemented a number of advanced combustion research projects that will lead to the establishment of a broad, commercially acceptable engineering data base for the advancement of coal as the fuel of choice for boilers, furnaces, and process heaters. Vortec Corporation's Coal-Fired Combustion System for Industrial Process Heating Applications has been selected for Phase III development under contract DE-AC22-91PC91161. This advanced combustion system research program is for the development of innovative coal-fired process heaters which can be used for high temperature melting, smelting, recycling, and refining processes. The process heater concepts to be developed are based on advanced glass melting and ore smelting furnaces developed and patented by Vortec Corporation. The process heater systems to be developed have multiple use applications; however, the Phase HI research effort is being focused on the development of a process heater system to be used for producing glass frits and wool fiber from boiler and incinerator ashes. The primary objective of the Phase III project is to develop and integrate all the system components, from fuel through total system controls, and then test the complete system in order to evaluate its potential marketability. The economic evaluation of commercial scale CMS processes has begun. In order to accurately estimate the cost of the primary process vessels, preliminary designs for 25, 50, and 100 ton/day systems have been started under Task 1. This data will serve as input data for life cycle cost analysis performed as part of techno-economic evaluations. The economic evaluations of commercial CMS systems will be an integral part of the commercialization plan.

88 (DOE/PC/91334–T76) **Combustion characterization of the blend of plant coal and recovered coal fines: [Quarterly] technical report, March 1, 1992–May 31, 1992.** Singh, S. (SS Energy Environmental International, Inc., Rockford, IL (United States)); Scaroni, A.; Miller, B.; Choudhry, V. SS Energy Environmental International, Inc., Rockford, IL (United States). [1992]. 15p. Sponsored by USDOE, Washington, DC (United States); Illinois Dept. of Energy and Natural Resources, Springfield, IL (United States). DOE Contract FG22-91PC91334. Order Number DE93000525. Source: OSTI; NTIS; GPO Dep.

The overall objective of this proposed research program is to determine the combustion characteristics of the blend derived from mixing a plant coal and recovered and clean coal fines from the pond. One plant coal and three blend samples will be prepared and utilized. The blend samples will be of a mixture of 90% plant coal + 10% fines, 85% plant coal + 15% fines, 80% plant coal + 20% fines having particle size distribution of 70% passing through -200 mesh size. These samples' combustion behavior will be examined in two different furnaces at Penn State University, i.e., a down-fired furnace and a drop-tube furnace. The down-fired furnace win be used mainly to measure the emissions and ash deposition study, while the drop tube furnace will be used to determine burning profile, combustion efficiency, etc. The burning profile of the plant coal and the three blends was determined in a thermogravimetric analyzer. Results indicated slower burning of the blends due to low volatile matter and oxidized coal particles. Ash fusing temperatures of the samples were determined using ASTM procedure. Preliminary combustion evaluation of the samples

(100% plant coal, 80% plant coal/20% recovered coal fines) indicated that the flame was stable at 100,000-200,000 Btu/hr firing rate. Carbon conversion efficiency of 85 to 90% was recorded using the Ash Tracer technique. Tests are continuing to determine the operating boundaries for these blends while measuring the emissions of SO_x, NO_x, CO and O_2, maintaining a stable flame.

89 (DOE/PC/91334–T78) **Cooperative research on the combustion characteristics of cofired desulfurized Illinois coal and char with natural gas: [Quarterly] technical report, March 1, 1992–May 31, 1992.** Buckius, R.O.; Wu, Cheng-Kang; Krier, H.; Peters, J.E. Illinois Univ., Urbana, IL (United States). [1992]. 20p. Sponsored by USDOE, Washington, DC (United States); Illinois Dept. of Energy and Natural Resources, Springfield, IL (United States). DOE Contract FG22-91PC91334. Order Number DE93000527. Source: OSTI; NTIS; GPO Dep.

The DTFF was modified to extend the operating range to larger sample collection capabilities and higher temperatures. A plasma gas heater was designed and constructed so that temperatures and heating rates encountered by pulverized coal particles in the flames of large boilers or in the advanced slogging combustors are better simulated. The modified DTFF, referred to as the Ash Characterization Facility, has been set up and initial tests with ash collection and analysis have been performed. The plasma torch has been tested, and steady operation has been established. The Ash Characterization Facility has been used to produce ash samples from IBC 106 coal at several temperatures and residence times. The total sulfur in the ash samples has been determined, showing the contributions of methane coming for operating parameters. A long sampling probe has been constructed, which win enable ash and char samples to be obtained at various residence times. Preparatory work with the gas chromatograph has been initiated to permit the simultaneous analysis of both the gas phase with the solid particle.

90 (DOE/PC/91334–T79) **Combustion of Illinois coals and chars with natural gas: [Quarterly] technical report, March 1, 1992–May 31, 1992.** Buckius, R.O.; Peters, J.E.; Krier, H. Illinois Univ., Urbana, IL (United States). [1992]. 24p. Sponsored by USDOE, Washington, DC (United States); Illinois Dept. of Energy and Natural Resources, Springfield, IL (United States). DOE Contract FG22-91PC91334. Order Number DE93000528. Source: OSTI; NTIS; GPO Dep.

Combined combustion of coal and natural gas offers advantages compared to burning coal or natural gas alone. For example, low volatile coals or low volatile chars derived from treatment or gasification processes can be of limited use due to their poor flammability characteristics. However, the use of natural gas in conjunction with the solid fuel can provide the necessary "volatiles" to enhance the combustion. Additionally, natural gas provides a clean cofiring fuel source which can enhance the usefulness of coals with high sulfur content. Addition of natural gas may reduce SO_x emissions through increased sulfur retention in the ash and reduce NO_x emissions by varying local stoichiometry and temperature levels. This research program seeks to clarify the contributions and to identify the controlling mechanisms of coining natural gas with Illinois coal through studies of particle ignition, burning rates and ash characterization. The first two quarters focused on the ignition delay measurements and their analysis, along with the incorporation of particle porosity into the burning rate model. The emphasis of the third quarter was on a more detailed understanding of the burning rate process, as well as understanding of cofiring's effects on sulfur retention. The contributions of particle burning area to the quantification of the particle burning mechanisms have been shown to be important and continue to be investigated. Ash samples for various methane concentrations under similar other conditions have shown positive trends in reducing $S0_2$ emission through increased sulfur capture in the ash.

91 (DOE/PC/91334–T80) **Behavior of sulfur and chlorine in coal during combustion and boiler corrosion: [Quarterly] technical report, March 1, 1992–May 31, 1992.** Chou, C.L. (Illinois State Geological Survey, Champaign, IL (United States)); Hackley, K.C.; Donnals, G.L.; Cao, J.; Ruch, R.R.; Pan, W.P.; Shao, D. Illinois State Geological Survey, Champaign, IL (United States). [1992]. 24p. Sponsored by USDOE, Washington, DC (United States); Illinois Dept. of Energy and Natural Resources, Springfield, IL (United States). DOE Contract FG22-91PC91334. Order Number DE93000529. Source: OSTI; NTIS; GPO Dep.

Four replicate experiments of pyrolysis with quadrupole gas analyzer and ion selective electrode were conducted to monitor the release of chlorine and sulfur from a high-chlorine Illinois coal IBC-109 (0.42% chlorine on dry basis). The chlorine in coal is released solely as HCl, and the HCl release profile shows a broad peak between 250°C and 600°C with a maximum at 445°C. In contrast, the sulfur release profile shows three peaks; the sulfur released around 370°C may be derived from a labile (possibly aliphatic) component of organic sulfur, the main peak at 475°C corresponds to the release of the main component (thiophenic) of organic sulfur, and the third peak at 600° results from the decomposition of pyrite. Sulfur dioxide (SO_2) is the major sulfur species under an oxidizing condition in the combustion gas; additional gaseous sulfur species (COS and H_2S) are observed when the atmosphere is changed to a reducing condition. Sodium and chlorine contents in char residues determined by neutron activation analysis showed that 98% of chlorine in coal was volatilized during pyrolysis to 800°C, and all the sodium is retained in the chars. The thermogravimetry-Fourier transform infrared (FTIR) spectroscopy experiments were carried out to characterize gaseous species during pyrolysis of four Illinois coals (IBC-103, -105, -106, and -109). Gas evolution profiles of sulfur (H_2S, $S0_2$, and COS), chlorine (HCl), and nitrogen (NH_3 and HCN) species were determined. Similar release profiles of HCl and NH_3 supported an interpretation that chlorine and nitrogen are closely associated in coal. COS may be formed by reaction of CO with H_2S in the gas phase.

92 (DOE/PC/91334–T96) **CFBC evaluation of fuels processed from Illinois coals: Technical report, March 1, 1992–May 31, 1992.** Rajan, S. (Southern Illinois Univ., Carbondale, IL (United States). Dept. of Mechanical Engineering and Energy Processes). Illinois State Geological Survey, Champaign, IL (United States). [1992]. 23p. Sponsored by USDOE, Washington, DC (United States); Illinois Dept. of Energy and Natural Resources, Springfield, IL (United States). DOE Contract FG22-91PC91334. Order Number DE93000947. Source: OSTI; NTIS; GPO Dep.

The combustion and emissions properties of (a) flotation slurry fuel beneficiated from coal fines at various stages of the cleaning process and (b) coal-sorbent pellets made from the flotation concentrate of the same beneficiation process using corn starch as binder is being investigated in a 4-inch internal diameter circulating fluidized bed combustor (CFBC). Combustion data such as SO_2, NO_x emissions, combustion efficiency and ash mineral matter analyses from these fuels are compared with similar parameters from a reference coal burnt in the same fluidized bed combustor. In the last quarter, the CFBC was brought on line and tests were performed on standard coal No. 3 from the Illinois Basin Coal Sample Program (IBCSP). During this quarter, it was decided, that a more meaningful comparison could be obtained if, instead of using the IBCSP No. 3 coal as a standard, the run-of-mine Illinois No. 5 coal from the Kerr-McGee Galatia plant could be used as the reference coal for purposes of comparing the combustion and emissions performance, since the slurry and pellet fuels mentioned in (a) and (b) above were processed from fines recovered form this same Illinois No. 5 seam coal. Accordingly, run-of-the mine Illinois No. 5 coal from the Galatia plant were obtained, riffled and sieved to −14+18 size for the combustion tests. Preliminary combustion tests have been made in the CFBC with this new coal. In preparation for the slurry tests, the moisture content of the beneficiated slurry samples was determined. Proximate and ultimate analyses of all the coal samples were performed. Using a Leeds and Northrup Model 7995-10 Microtrek particle size analyzer, the size distributions of the coal in the three slurry samples were determined. The mineral matter content of the coal in the three slurry samples and the Illinois No. 5 seam coal were investigated using energy dispersive x-ray analysis.

93 (DOE/PC/91334–T98) **The use of FBC wastes in the reclamation of coal slurry solids: Technical report, March 1, 1992–May 31, 1992.** Dreher, G.B. (Illinois State Geological Survey, Champaign, IL (United States)); Roy, W.R.; Steele, J.D. Illinois Dept. of Energy and Natural Resources, Springfield, IL (United

States). [1992]. 19p. Sponsored by USDOE, Washington, DC (United States); Illinois Dept. of Energy and Natural Resources, Springfield, IL (United States). DOE Contract FG22-91PC91334. Order Number DE93000944. Source: OSTI; NTIS; GPO Dep.

Fluidized bed combustion (FBC) is a relatively new technology that is used commercially for the combustion of coal. In Illinois, this technology is valuable because it allows the combustion of Illinois high sulfur coal without pollution of the atmosphere with vast quantities of sulfur oxides. In FBC, coal is mixed with limestone or dolomite either before injection into the combustion chamber or in the combustion chamber. As the coal burns, sulfur in the coal is oxidized to SO_2 and this is trapped by reaction with the limestone or dolomite to form gypsum ($CaSO_4 \cdot 2H_2O$). Solid by-products from FBC are generally a mixture of calcium oxide, gypsum, coal ash, and unburned coal. The present research project is designed to provide initial data on one possible use of FBC waste. FBC wastes from five different locations in Illinois are mixed with coal slurry solids (CSS) from two different coal preparation plants at Illinois coal mines. In mixtures of FBC waste and coal slurry solids, the alkaline components of the FBC waste are expected to react with acid produced by the oxidation of pyrite in the coal slurry solid. An objective of this research is to determine the chemical composition of aqueous leachates from mixtures of FBC wastes, generated under various operating conditions, and the coal slurry solids. These data will be used in future research into the ability of such mixtures to support seed germination and plant growth. The final goal of this and future research is to determine whether mixed FBC waste and coal slurry solids can be used as a satisfactory growing medium in slurry pond reclamation. The chemical analyses of the 8 starting solids (5 FBC wastes, 2 Css samples, and 1 agricultural limestone sample) were completed.

94 (DOE/PC/91334–T100) **Evaluation and utilization of Illinois FBC residues for construction materials: Technical progress report, March 1, 1992–May 31, 1992.** Ghafoori, N. (Southern Illinois Univ., Carbondale, IL (United States). Dept. of Civil Engineering and Mechanics); Sami, S. Illinois Dept. of Energy and Natural Resources, Springfield, IL (United States). [1992]. 17p. Sponsored by USDOE, Washington, DC (United States); Illinois Dept. of Energy and Natural Resources, Springfield, IL (United States). DOE Contract FG22-91PC91334. Order Number DE93000942. Source: OSTI; NTIS; GPO Dep.

The overall objective of this program is to investigate the extent to which fluidized bed combustion (FBC) by-products can be properly utilized as viable construction materials. This investigation focuses primarily on the properties of residues derived from fluidized combustion burning of Illinois high-sulfur coal. The research plan calls for evaluation of physics-chemical and engineering characteristics of the FBC-based cement and non-cement mixes. The results of this study will be used to compare the physical and mechanical properties of the FBC-based mixtures with those of conventional mixes. The suitability of using FBC residues as a filler or binder aggregate for Portland cement-based mixtures and Non-Portland cement mixes in the form of conventional and roller compacted materials will be evaluated. During this reporting period, physics-chemical properties of class F fly ash, supplied by the American Fly Ash Company of Naperville, Illinois, were completed. Work on all major tasks, sulfate durability of FBC cement-based mixtures and Engineering characteristics of roller compacted non-cement FBC mixes (task II), are on-going.

95 (NEDO-P–9112) **Estimation of coal usage technologies in relation to CO_2 for global environment. (3).** New Energy and Industrial Technology Development Organization, Tokyo (Japan). Mar 1992. 126p. (In Japanese). Sponsored by New Energy and Industrial Technology Development Organization, Tokyo (Japan). Order Number DE93723964. Source: OSTI; NTIS.

The paper conducts a research on a future trend of development of CO_2 emission reduction technology in the main industries and states its future prospect. It also proposes the future state of coal utilization technology based on the results of the research. CO_2 emission is predicted by a long-term energy supply/demand outlook, and the future energy system technology and energy conservation measures are mentioned. Future technologies are described relating to CO_2 reduction measures in such main coal utilization industries as electric utility, iron and steel, cement, petroleum, town gas and chemical industry. As one of the technologies to treat CO_2 emitted from each industry, underground injection/fixation method is studied in terms of its economic efficiency. Coal gasification/liquefaction and coal combustion technologies are taken up as long-term coal utilization technologies, and the future state of development of the coal utilization technology in the global environment is proposed. 92 refs., 68 figs., 44 tabs.

96 (ETDE/JP-mf–93723857) **Handbook for coal mine safety maintenance techniques. 9.: Safety maintaining technology.** Coal Mining Research Centre, Tokyo (Japan). Mar 1992 108p. (In Japanese). Order Number DE93723857. Source: OSTI; NTIS.

This is a report on coal mine safety maintenance techniques published as a part of the mine safety maintenance technique survey commissioned from the Ministry of International Trade and Industry in the fiscal year 1991. This volume describes on five areas, i.e., general safety control, undersea coal mine safety control, coal mine waste water safety control, administrative policies on safety maintenance and assisting systems, and safety maintenance statistics. The general safety control for example ranges from personal control system and mechanism to functions of the Safety Section, items requiring executives' approvals, education, and to safety control systems using devices, as shown in the presented examples of safety control in normal conditions used in representative coal mines. Then, the report describes on safety control at emergencies as to first aid facilities, life saving devices, evacuation systems, and trainings. Mines are characterized largely by the elements of "nature" in addition to man and machine elements, which increase difficulty in identifyihg and monitoring properties and characteristics of the elements, as well as labor intensiveness. Inasmuch as, safety control systems operated by people, and roles of operating persons are very important. 16 refs., 37 figs., 12 tabs.

97 (DOE/BC/14403–3) **Characterization of oil and gas reservoir heterogeneity: Final report.** Tyler, N.; Barton, M.D.; Bebout, D.G.; Fisher, R.S.; Grigsby, J.D.; Guevara, E.; Holtz, M.; Kerans, C.; Nance, H.S.; Levey, R.A. Texas Univ., Austin, TX (United States). Bureau of Economic Geology. Oct 1992. 219p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG22-89BC14403. Order Number DE92001072. Source: OSTI; NTIS; GPO Dep.

Research described In this report addresses the internal architecture of two specific reservoir types: restricted-platform carbonates and fluvial-deltaic sandstones. Together, these two reservoir types contain more than two-thirds of the unrecovered mobile oil remaining ill Texas. The approach followed in this study was to develop a strong understanding of the styles of heterogeneity of these reservoir types based on a detailed outcrop description and a translation of these findings into optimized recovery strategies in select subsurface analogs. Research targeted Grayburg Formation restricted-platform carbonate outcrops along the Algerita Escarpment and In Stone Canyon In southeastern New Mexico and Ferron deltaic sandstones in central Utah as analogs for the North Foster (Grayburg) and Lake Creek (Wilcox) units, respectively. In both settings, sequence-stratigraphic style profoundly influenced between-well architectural fabric and permeability structure. It is concluded that reservoirs of different depositional origins can therefore be categorized Into a "heterogeneity matrix" based on varying intensity of vertical and lateral heterogeneity. The utility of the matrix is that it allows prediction of the nature and location

of remaining mobile oil. Highly stratified reservoirs such as the Grayburg, for example, will contain a large proportion of vertically bypassed oil; thus, an appropriate recovery strategy will be waterflood optimization and profile modification. Laterally heterogeneous reservoirs such as deltaic distributary systems would benefit from targeted infill drilling (possibly with horizontal wells) and improved areal sweep efficiency. Potential for advanced recovery of remaining mobile oil through heterogeneity-based advanced secondary recovery strategies in Texas is projected to be an incremental 16 Bbbl. In the Lower 48 States this target may be as much as 45 Bbbl at low to moderate oil prices over the near- to mid-term.

98 (DOE/ID/12839–8) **Characterization of oil and gas reservoir heterogeneity: Technical progress report, April 1, 1992–June 30, 1992.** Sharma, G.D. Alaska Univ., Fairbanks, AK (United States). Petroleum Development Lab. [1992]. 15p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG07-90ID12839. Order Number DE93000517. Source: OSTI; NTIS; GPO Dep.

The ultimate objective of this cooperative research project is to characterize Alaskan petroleum reservoirs in terms of their reserves, physical and chemical properties, geologic configuration in relation to lithofacies and structure, and development potential. The project has two tasks: Task 1 is a geological description of the reservoirs including petrophysical properties, i.e., porosity, permeability, permeability variation, formation depth, temperature, and net pay, facies changes and reservoir structures as drawn from cores, well logs, and other geological data. Task 2 is reservoir fluid characterization-determination of physical properties of reservoir fluids including density, viscosity, phase distributions and composition as well as petrogenesis-source rock identification; and the study of asphaltene precipitation for Alaskan crude oils. Results are discussed.

99 (NEI-DK–977) **Optimization of reflection seismic acquisition parameters.** Westphal Stephesen, M.; Mosegaard, K. Oedegaard og Danneskiold-Samsoee ApS, Copenhagen (Denmark). Aug 1992 159p. Contract EM-1313/88-6. Order Number DE93721456. Source: OSTI; NTIS.

EFP-88.

The analysis of seismic data, is one of the most important sources of information on physical parameters of geological strata. The key to this coded information is a mathematical description of the spread of the seismic waves. Maximum information can, in theory, be gained by the use of an inversion method, but this can only give geological information limited by the nature of the problem and the conditions under which data were acquired. The report tries to give answers to the problems concerning the effect of deviation from ideal conditions, and which data collection parameters give the greatest possible information value of the data content within the practical limits. A simplified, reflection seismic data acquisition problem is investigated with the aim of optimizing the choice of data acquisition parameters. A description is given of the spread of the seismic waves comprising a set of equations for the calculation of wave spread times, wave forms, amplitudes etc which are included in data collection parameters. The goal for the data quality is a figure which is defined in such a way that it grows in accordance with the quality of the geological information found in the data. Data quality indicators are spectral band breadths of data, apertures etc. supplemented by uptake time and sampling frequency. It is hoped that this method will lead to the development of automatic optimization of seismic data collection parameters. The detailed mathematical model of the data generation process is presented and explained and a print of the whole main computerized optimization programme is given. (AB) (93 refs.).

100 (DOE/BC/14664–8) **Polysaccharides and bacterial plugging: [Quarterly report], April 1–June 30, 1992.** Fogler, H.S. Michigan Univ., Ann Arbor, MI (United States). [1992]. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-90BC14664. Order Number DE92041138. Source: OSTI; NTIS; GPO Dep.

The objectives of this research are to elucidate and model bacterial transport in porous media, to determine the importance of polysaccharides bridging as a retentive mechanism, and to identify key parameters that influence porous media plugging. This project has been subdivided into three tasks: Task 1 is the determination of the growth kinetics of the Leuconostoc bacteria and how they are affected by (1) the nutrient feed, and (2) surface effects; Task 2 will quantify the importance of polysaccharide production as a cell retention mechanism; and Task 3 is the elucidation of the rate of polysaccharide production and the combined effect that polysaccharide production and cell growth has upon plugging. Batch growth experiments have been conducted to determine the rate of cell growth, polymer production and nutrient consumption. The data from these experiments are currently being reduced to aid the development of an overall growth model.

101 (DOE/CE/15482–T8) **The development and testing of a fieldworthy system of improved fluid pumping device and liquid sensor for oil wells: Technical progress report, third quarter 1992.** Buckman, W.G. Buckman (William G.), Bowling Green, KY (United States). 5 Oct 1992. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG01-90CE15482. Order Number DE93000650. Source: OSTI; NTIS; GPO Dep.

An economical gas lift system has been designed that uses the airlift principles of the APOP system to enable one to pump deep wells which have been initially pumped using jack pumps. It can be constructed and installed in oil and/or gas wells where jack pumps have been operating. The 2 in. tubing in the bore hole is left in place and the rods are pulled from the normally 2 in. tubing. A 1 in. or greater diameter tubing containing a one way valve near its bottom and several small holes near the bottom of the 1 in. tube and just above the one way valve is installed into the 2 in. tubing. The one inch tube extends the total length of the 2 in. tubing and is seated on the seating nipple at the bottom of the 2 in. tubing. The space between the concentric tubes can serve as the gas(air) line and the center 1 in. tube serves as the liquid discharge line. This enables this pump to be used in many marginal wells which ordinarily would be uneconomical to pump. This is especially true for deep wells because the cost of jack pumps and the tubing as well as the maintenance to pump liquids from bore holes that are several thousand feet deep is substantial.

102 (DOE/CE/15497–T2) **Design, build, develop, and test a fieldworthy spiral tool and packer for casing repair: Quarterly report, June 16, 1992–September 15, 1992.** Koster, C. Nu-Bore Systems, Wichita Falls, TX (United States). [1992]. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG01-91CE15497. Order Number DE93000735. Source: OSTI; NTIS; GPO Dep.

A new method for sealing casing is currently under development by Nu-Bore Systems. The method involves internally lining a section of the wellbore with a multi-layer spiral wrapping of a high strength, corrosion resistant metal interleaved with a high bond strength, resilient epoxy. The high strength metal is preferably a copper based alloy hardened to a very high strength in order to resist the internal and external pressures of downhole environments. The epoxy adhesive formulation is one that forms a bond between the steel inner wall of the casing and copper alloy strip. The copper alloy strip spiral wraps are interleaved with epoxy, and the whole system provides a high level of outward directed spring force and, thus, resists both internal and externally directed forces. This method has been assessed by the Department of Energy, and the magnitude of the oilfield need and the technology are described in a DoE report entitled, "Downhole Casing Repair System" (OERI Number 013152). In this report, the cost savings to the nation's energy program was estimated to be in the range of hundreds of millions of dollars per year, and the method was judged technically feasible once certain well defined engineering obstacles are overcome.

103 (DOE/CE/15553–T1) **System to inject steam and produce oil from the same wellbore through downhole valve switching: First quarterly report.** S-Cal Research Corp., San

Rafael, CA (United States). [1992]. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG01-92CE15553. Order Number DE93000914. Source: OSTI; NTIS; GPO Dep.

Various Downhole Equipment systems have been designed for typical applications in three California Oilfields,based on well data gathered from three different Operating Companies. The first system, applicable to a 2,000 ft deep reservoir (Monarch) a highly underpressured, unconsolidated sand of 200 ft net pay, located in the Midway-Sunset field, is based on the use of a new well. The second well configuration considered was the re-entry into an existing well equipped with a 7 inches casing and penetrating into two separate sandstone reservoirs, at normal pressures in the North Antelope Hills field. Only the bottom layer is presently in production through a gravel-packed 5.5 inch linear, while the upper zone is behind the cemented casing. The third case studied was the re-entry into an existing well equipped with an 8 5/8 inch casing, presently unperforated, into a thin under-pressured sand reservoir (Weber) in the Midway-Sunset field. All three California fields contain Heavy Oils of different but relatively high viscosities. A new class of potential applications of our new technology has also been considered: the recovery of Light Oil (> 20 API) by steam injection in under-pressured Carbonate reservoirs which lay at depths beyond the economic limit for conventional steam injection technology. The possibility of including this application in a Field Test proposal to the DOE, under the Class II Oil Program, is now under review by various Operators. A drilling contractor experienced in drilling multiple horizontal wells in Carbonate reservoirs and a team of reservoir engineers experienced in the recovery of Light Oil by steam in fractured reservoirs have expressed their interest in participating in such a joint Field Project. Laboratory tests on specific prototypes of Downhole Sealing Elements are underway.

104 (DOE/ER/75419–T1) **A research agenda for academic petroleum engineering programs: [Final report].** Calhoun, J.C. Jr. Texas A and M Univ., College Station, TX (United States). Texas Engineering Experiment Station. 31 Mar 1990. 124p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG05-88ER75419. Order Number DE93002880. Source: OSTI; NTIS; GPO Dep.

The development of a research agenda should be a direct way of portraying the scope of petroleum engineering, of identifying the critical technological issues faced by the profession,of elucidating the gaps between the existing research resources and the needs. and of outlining a program of research through which the petroleum engineering departments can be collectively of maximum service. Such an agenda would be of value to the profession of petroleum engineering, to industry and to government agencies, as well as to the faculty and students of the petroleum engineering departments. The purposes of the activity that led to this report, therefore, were to develop a statement to serve as a beginning research agenda for the petroleum engineering academic community; to bring together representatives of the petroleum engineering academic community to recognize the importance of developing a consensus posture with respect to research; and to provide a document that will assist in portraying to industry, government agencies and others the problems and needs of the petroleum engineering departments for conducting research. Contents of this report include; introduction; the background; the scope of petroleum engineering research; priority research topics and technological issues; non-technological research issues; and conclusions and recommendations.

105 (DOE/NV/10412–3) **Department of Petroleum Engineering and Center for Petroleum and Geosystems Engineering annual report, 1990–1991 academic year.** Texas Univ., Austin, TX (United States). [1991]. 107p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FC07-85NV10412. Order Number DE93000934. Source: OSTI; NTIS; GPO Dep.

The Department of Petroleum Engineering at The University of Texas at Austin is one of more than 20 such departments in the United States and more than 40 worldwide. The department has more than 20 faculty members and, as of the fall of 1990, 146 undergraduate and 156 graduate students. During the 1990–91 academic year, undergraduate enrollment is up slightly from the several downturns that began in 1986; graduate enrollment continues to increase, significantly in the number of Ph.D. candidates enrolled. The 1990–91 academic year was one of consolidation of gains. A remote teaching program in the Midland-Odessa area was initiated. During 1991, the Center for Petroleum and Geosystems Engineering (CPGE) continued its large, diversified research activities related to oil, gas and geopressured/geothermal energy production, energy and mineral resources analysis, and added new research projects in other areas such as groundwater remediation. Many of these research projects included interdisciplinary efforts involving faculty, research scientists and graduate students in chemistry, mathematics, geology, geophysics, engineering mechanics, chemical engineering, microbiology and other disciplines. Several projects were undertaken in cooperation with either the Bureau of Economic Geology or the Institute for Geophysics at The University of Texas at Austin. Collaborative research projects with scientists at Brookhaven National Laboratory, Los Alamos National Laboratory, Rice University, and Sandia National Laboratory were also initiated. About 43 companies from seven countries around the world continued to provide the largest portion of research funding to CPGE.

106 (IFP–38544) **Surge and swab pressures in the annulus of oil wells while roundtrips operations.** Al-Delaimi, S. Institut Francais du Petrole (IFP), 92 - Rueil-Malmaison (France); Universite de Technologie de Compiegne, 60 (France). Apr 1991. 234p. (In French). Order Number DE93721368. Source: OSTI; NTIS (US Sales Only).

Surge and swab pressures are difficult to evaluate. Operating parameters were measured with Newtonian and non-Newtonian fluids. The effects of the thixotropy and the salinity of suspensions were also investigated. The values of surge and swab pressures obtained are related to the instantaneous physico-chemical state of these suspensions. The precision of the rheological parameters and a precise model are very important. The hypothesis of the equality between surge and swab pressures is not always valid, where the phenomenon of piston action appears easily in most of the cases. The pressure coming from the effect of viscosity is much more important than from inertia and from gelification. Also it was found that the gradients of pressures are a quasi linear functions of depth. The theoretical fluid flow friction factor in the annulus is underestimated. A value of 36 is proposed for the product of friction factor by the Reynolds number. Appendices are included in volume 2.

107 (IFP–38544A) **Surge an swab pressures in the annulus of oil wells while roundtrips operations. Vol.2.** Al-Delaimi, S. Institut Francais du Petrole (IFP), 92 - Rueil-Malmaison (France); Universite de Technologie de Compiegne, 60 (France). Apr 1991. 80p. (In French). Order Number DE93721369. Source: OSTI; NTIS (US Sales Only).

This second volume includes only the appendices of the thesis. In particular experimental results of swab and surge pressure obtained with newtonian fluids, bentonite, carboxymethylcellulose solutions and their mixtures and also influence of salinity, thixotropy celerity and acceleration.

108 (IFP–39895) **Comparative study of thermodynamical properties and research on miscibility between injection gases and light petroleum: Mesdar and Zarzaitine oil fields applications.** Naili, N. Lyon-1 Univ., 69 (France). 27 Feb 1992. 332p. (In French). Order Number DE93721353. Source: OSTI; NTIS (US Sales Only).

Several of Algerian oil reservoirs are now at the end of their exploitation eventhough most of the oil is still in place. The implementation of an enhanced oil recovery method can yield a substantial amount of additional oil. A good knowledge of the thermodynamic properties of crude oil in presence of various gases either conventional (methane, CO2, rich gas), or not (nitrogen, flue gas) is absolutely necessary for understanding the physical and chemical mechanisms involved in the field of enhanced oil recovery by miscible or immiscible gas injection. The present work deals with a study of two natural crude oils. One coming from the Mesdar field, the other from the Zarzaitine field. After a classical PVT (Pressure Volume Temperature) study of two crude oils alone, the same measurements were carried out with many mixtures 'oil+injection gas'. In a second step, displacements of both oils in an artificial porous medium were performed, and the minimum miscibility pressures (MMP) were measured with different gases.

Finally, two numerical simulations were carried out. The first with a 'PVT package' model to restitute thermodynamic properties of the two crude oils and their mixtures with the different gases, the second by means of a new 'ΣCORE' model to simulate the displacements. 63 refs.

109 (NEI-NO–279) **Scale formation during oil recovery: A kinetic model.** Rollheim, M. Trondheim Univ. (Norway). Norges Tekniske Hoegskole. 1991 190p. Order Number DE93721629. Source: OSTI; NTIS.

A kinetic model for the precipitation - dissolution of the scale forming minerals $BaSO_4$, $SrSO_4$, $CaCO_3$, $FeCO_3$, $CaSO_4$, and $CaSO_4x2H_2O$, including the kinetics of the CO_2-H_2O system, is developed. The model is based on experimental data on the kinetics of these reactions in aqueous solutions. Influence of temperature, pressure and ionic strength on the solubility of these minerals is included using a predeveloped solubility model. By combining the kinetic model with a hydrodynamic model for the simultaneous transport of oil, water and gas in the near well area and in the production tubing, it is possible to estimate in which part of the production system scaling will occur. $BaSO_4$ precipitation experiments has been performed in steel tubing in order to obtain knowledge about scaling mechanisms. Two waters, one containing Ba^{2+} the other SO_4^{2-}, were mixed at the entrance of the tubing and the amount of scale formed and the concentration of barium ions along the pipe were measured. Comparison between experimental data and the scale prediction model show that the model is capable of predicting the Ba^{2+} concentration profiles and therefore also the amount of $BaSO_4$(s) formed, along the tubing. The $BaSO_4$ scale profile is slightly underestimated due to nucleation and particle transport processes which are not accounted for. A linear relationship is indicated between the surface area for crystal growth and the inverse tube radius. This is in accordance with model predictions. Model calculations on a North Sea well gave a scale build-up profile along the 2800 m long tubing from the bottom to the well, which agreed quantitatively with the scale thickness measured in the tubing. 154 refs., 31 figs., 5 tabs.

111 **Method and apparatus for the determination of formation fluid flow rates and reservoir deliverability.** Peterson, G. 18 Jul 1992. Filed date 17 Jan 1991. Canada Patent patent application 2034444. 17p. Source: Micromedia Ltd., Technical Information Centre, 165 Hotel de Ville, Place du Portage, Phase 2, Hull, Quebec, Canada J8X 3X2. Prices: PC $6.00 CAN; MF $4.00 CAN.

A method and apparatus are provided for measuring fluid flow rates and the absolute open flow (AOF) potential of a subterranean formation penetrated by a wellbore. The invention can be described as a formation fluid flow rate test tool which is conveyed and operated on a wireline logging cable. The downhole test tool comprises an arrangement of inflatable packers to isolate an interval and a pump which extracts fluid from the formation through an inlet below the uppermost packer. The method allows for sequentially increasing or decreasing the pump rate and hence flow rates and measuring the corresponding pressures. From these data, the reservoir flow characteristics, properties and deliverability can be accurately calculated, which was not previously permitted with other known wireline-conveyed sampling and testing tools. In addition, the invention allows for the reservoir parameters to be obtained under dynamic conditions, emulating an AOF test which was previously only obtained after completion of the well. This method and apparatus presents an economical and time effective technique with which to enter into a decision regarding the disposition of a wellbore. 5 figs.

0204 Processing

112 (IFP–39436) **Thermal cracking of hydrocarbon mixtures at high pressure: experimental kinetic study and numerical modeling, implications for petroleum geochemistry.** Kressmann, S. Paris-6 Univ., 75 (France); Institut Francais du Petrole (IFP), 92 - Rueil-Malmaison (France). 20 Nov 1991. 294p. (In French). Order Number DE93721296. Source: OSTI; NTIS (US Sales Only).

The aim of this work is to have a better understanding of the elementary reactions involved in thermal cracking of crude oil in sedimentary basins, and to study their kinetics as a function of temperature and pressure. The knowledge of these reactions together with their kinetic parameters is possible through pyrolysis of simple mixture of pure compounds at low conversion. Experiments have been carried out on two simple mixtures: n-hexane + benzene and n-hexane + 2-4dimethylpentane, which were chosen because products of the reactions were simple enough for identification and quantification and these compounds are considered to be representative of hydrocarbon structures present in crude oils. Pyrolysis were performed in closed gold cells at different pressures (10, 20 and 200 MPa) and temperatures (300-400 deg C). Experimental results obtained for the mixture n-hexane+2-4dimethylpentane indicate that the overall pyrolysis rate increase of a factor of about two at five when the pressure increases from 10 MPa to 200 MPa. For the mixture n-hexane+benzene the effect of pressure is to decrease sightly the overall pyrolysis rate for the same range of pressure. The kinetic models consist of a succession of free radical reactions with intermediate compounds occurring at low concentrations (radical, unsaturates for instance). The numerical simulations of the chemical models for the mixture of n-hexane+benzene at lower conversion are in agreement with the experimental data. We developed a method to lump the chemical kinetic equations in order to find a way to simulate the n-hexane+2-4dimethylpentane reaction mechanism and to elaborate a semi empirical model for thermal cracking of crude oil. The final goal is to predict the thermal evolution of crude oils in reservoirs for petroleum exploration, we compared our numerical simulation results with a kinetic model of crude oil. 116 refs., 50 figs., 67 tabs.

113 (IFP–39564) **Hydrogen interaction with catalyst support Platinum. Influence of particle size, additives and type of catalyst support.** Rochefort, A. Paris-6 Univ., 75 (France); Institut Francais du Petrole (IFP), 92 - Rueil-Malmaison (France); Ecole Nationale Superieure du Petrole et des Moteurs (ENSPM), 92 - Rueil-Malmaison (France). 22 Jan 1992. 195p. (In French). Order Number DE93721298. Source: OSTI; NTIS (US Sales Only).

Cycloalkanes are the principal constituent of petroleum fractions during catalytic reforming. Their dehydrogenation gives a major part of aromatic compounds and hydrogen. In this thesis, the influence of particle size on Platinum activation energy, in opposite to cycloalkanes or hydrogen, is studied. Additives effects (as Chlorine or Potassium) on physico chemical and catalytic properties of Platinum catalyst supports are described. 156 refs., 53 figs., 24 tabs.

114 (IFP–39696) **Petroleum hydrocracking face to face Molybdenum based dispersed catalyst.** Elmouchnino, J. Paris-6 Univ., 75 (France); Institut Francais du Petrole (IFP), 92 - Rueil-Malmaison (France). 27 Mar 1992. 338p. (In French). Order Number DE93721297. Source: OSTI; NTIS (US Sales Only).

This study has analysed the behaviour of petroleum during hydrocracking process. The conversion is an heterogeneous catalysis realized under hydrogen pressure, face to face a molybdenum dispersed catalyst. The qualitative improvement of coke formation is in relation with the hydrogen transfer effect and dispersed catalyst quantity. A preprocessing stage, as molybdophosphoric acid used as precursor, allows to obtain dispersed catalyst. The association of dispersed catalyst with a poly aromatic compound (pyrene, catalytic slurries) may create a synergy effect on the control of coke formation. The study of the 9-dodecyl phenanthrene allows to quantify catalyst activation energy. The study of reactions responsible of semi coke formation has been realized with the help of acenaphtylene. 152 refs., 78 figs., 57 tabs.

115 **Normal paraffin adsorptive separation using non-normal hydrocarbon pre-pulse stream.** Kulprathipanja, S. 1 Aug

1992. Filed date 31 Jan 1991. Canada Patent patent application 2035337. 33p. Source: Micromedia Ltd., Technical Information Centre, 165 Hotel de Ville, Place du Portage, Phase 2, Hull, Quebec, Canada J8X 3X2. Prices: PC $6.00 CAN; MF $4.00 CAN.

An adsorptive separation process for separating normal paraffins from non-normal hydrocarbons in which the paraffins have from about 10 to about 35 carbon atoms per molecule utilizes a molecular sieve adsorbent having an effective channel diameter of ca 5 angstroms. According to the invention, this process is improved by passing a non-normal hydrocarbon input stream into the adsorption zone at adsorption conditions to promote the selective adsorption of the straight chain hydrocarbon constituents of the feed material in contact with the adsorbent in preference to the lighter straight chain hydrocarbon constituents of the desorbent material also in contact with the adsorbent. The preferred normal paraffins in the desorbent are C_{4-8} and the preferred non-normal hydrocarbons in the desorbent, when used, are branched chain paraffins having lower carbon numbers than those in the feed stream. Experiments are described to illustrate the process of the invention. 2 figs., 7 tabs.

The publication deals with the regulations concerning pipeline systems in the petroleum activities, issued by the Norwegian Petroleum Directorate 30 April 1990 pursuant to Regulations concerning safety etc., laid down by Royal Decree of 28 June 1985, cf. Section 7, cf. Sections 49-51, cf. decision concerning delegation of authority by the Ministry of Local Government and Labour of 28 June 1985. 7 tabs.

126 (RF–9/91) **Using foam to reduce sand production.** Dalland, M.; Hanssen, J.E. Rogalandsforskning, Stavanger (Norway). Jan 1991. 13p. Order Number DE93721643. Source: OSTI; NTIS.

The intention with this project was to investigate the possible use of foam as a new method for reduction of sand production. This could be an alternative method for the conventional gravel pack, or a substitute. A laboratory model was constructed for the purpose of being able to produce sand in a controlled manner. The equipment proved unsatisfactory because particles appear to be produced by a different mechanism from that expected in the field, but improvements are proposed. Criteria for selecting foam systems for this application are defined in light of a proposed mechanisms of action. A suitable foam system for laboratory model studies is identified. Based on this system and these criteria it appears likely that a field-testable foam system can be found with a reasonable amount for product screenings. 16 refs., 7 figs.

The International Petroleum Statistics Report presents data on international oil production, demand, imports, exports, and stocks. The report has four sections. Section 1 contains time series data on world oil production, and on oil demand and stocks in the Organization for Economic Cooperation and Development (OECD). This section contains annual data beginning in 1980, and monthly data for the most recent two years. Section 2 presents an oil supply/demand balance for world. This balance is presented in quarterly intervals for the most recent two years. Section 3 presents data on oil imports by OECD countries. This section contains annual data for the most recent year, quarterly data for the most recent two quarters, and monthly data for the most recent twelve months. Section 4 presents annual time series data on world oil production and oil stocks, demand, and trade in OECD countries. World oil production and OECD demand data are for the years 1970 through 1991; OECD stocks from 1973 through 1991; and OECD trade from 1982 through 1991.

130 (DOE/EIS–0165-D-Vol.1) **Draft Environmental Impact Statement on the expansion of the Strategic Petroleum Reserve, Alabama, Louisiana, Mississippi, and Texas: Volume 1, Chapters 1–5.** USDOE, Washington, DC (United States). Oct 1992. 445p. Sponsored by USDOE, Washington, DC (United States). Order Number DE93002186. Source: OSTI; NTIS; GPO Dep.

The proposed action entails the development of a plan for 250 million barrels of new crude oil storage capacity in two Gulf Coast salt domes to expand the Strategic Petroleum Reserve pursuant to Congressional directive (PL 101–383 and PL 101–512). Storage capacity would be developed by solution-mining the salt which would require about two billion barrels of surface water and would generate about two billion barrels of salt brine. The brine would be disposed of primarily by ocean discharge and alternatively by deep underground injection. Crude oil fill and distribution systems would require new pipelines and terminal facilities. This EIS assesses the impacts of construction and operation for the range of alternatives being considered and focuses on oil and brine spill risk and impacts of brine disposal, water and land use, groundwater contamination, hydrocarbon emissions, and involvement with wetlands and floodplains.

131 (EUR–14236) **Effects of organic contaminants in sewage sludge on soil fertility, plants and animals.** Hall, J.E. (ed.) (Water Research Association, Medmenham (United Kingdom)); Sauerbeck, D.R. (ed.); L'Hermite, P. (ed.). Commission of the European Communities, Luxembourg (Luxembourg). 1992. 224p. (CONF-9006428–: Seminar on Effects of organic contaminants in sewage sludge on soil fertility, plants and animals, Braunschweig (Germany), 6-8 Jun 1990). Source: OSTI; NTIS (US Sales Only); INIS.

Sewage sludge production in Europe will continue to rise as a result of higher environmental standards, making disposal increasingly difficult in the future. A considerable part of this sludge is spread beneficially on agricultural land as an organic fertilizer, however, this outlet is very sensitive to the problems associated with the inorganic and organic contaminants which sludge inevitably contains. Much research has been devoted to the problems of contaminants in sludge and their potential effects on soil, plants, animals and man in recent years, and the European Commission's Concerted Action COST 681 has provided a valuable forum for the exchange of views and progress of research on sludge treatment and disposal. This book contains 19 papers presented to a joint meeting of Working Party 4 (Agricultural Value) and Working Party 5 (Environmental Effects) of COST 681, held at the German Federal Research Centre of Agriculture (FAL), Braunschweig on 6-8 June 1990. The meeting addressed two areas of current concern; the occurrence, behaviour and transfer of sludge-derived organic contaminants (Session 1), and the influence of inorganic and organic contaminants on soil micro-organisms and their activities (Session 2).

132 (EUR–14236, pp. 35-44) **Chlorinated hydrocarbons and PCBs in field soils, sediments and sewage sludges.** Schaaf, H. (Hessische Landwirtschaftliche Versuchsanstalt, Kassel (DE)). Commission of the European Communities, Luxembourg (Luxembourg). 1992. (CONF-9006428–: Seminar on Effects of organic contaminants in sewage sludge on soil fertility, plants and

animals, Braunschweig (Germany), 6-8 Jun 1990). In *Effects of organic contaminants in sewage sludge on soil fertility, plants and animals.* 224p. Order Number DE93721694. Source: OSTI; NTIS (US Sales Only); INIS.

As requested by the Ministry of Agriculture of the FRG, the 'Verband Deutscher Landwirtschaftlicher Untersuchungs- und Forschungsanstalten (VDLUFA)' built up a data collection over chlorinated hydrocarbons and PCBs in field soils, sediments, sewage sludges. Nearly 70.000 samples were collected and statistically evaluated. The results of these investigations will be described. The major constituents of the chlorinated hydrocarbons generally were Lindane, DDT(total) and HCB. In sewage sludges PCBs could be detected in nearly every sample. The contents of PCBs in field soils are smaller than in sewage sludges. Rather 'high contents', greater than 100-200 μg/kg d.m./organic pollutants, were detected only in 2% of the samples. 7 refs., 5 figs., 2 tabs.

133 (EUR–14236, pp. 70-77) **The persistence of polynuclear aromatic hydrocarbons in sewage sludge-amended agricultural soils.** Wild, S.R. (Lancaster Univ. (United Kingdom)); Jones, K.C.; Berrow, M.L. Commission of the European Communities, Luxembourg (Luxembourg). 1992. (CONF-9006428–: Seminar on Effects of organic contaminants in sewage sludge on soil fertility, plants and animals, Braunschweig (Germany), 6-8 Jun 1990). In *Effects of organic contaminants in sewage sludge on soil fertility, plants and animals.* 224p. Order Number DE93721694. Source: OSTI; NTIS (US Sales Only); INIS.

In 1968 five metal enriched sewage sludges containing different concentrations of polynuclear aromatic hydrocarbons (PAHs) were applied to different plots on field soils at two experimental sites, Luddington and Lee Valley in the UK. This resulted in substantial increases in soil ΣPAH concentrations in all plots. Since application compound specific losses have occurred, with the high molecular weight PAHs being more persistent. Calculated half-lives range from under 2 years for naphthalene to over 9 years for benzo[ghi]perylene and coronene. The loss of PAH compounds in these field experiments can be related, in part, to certain physicochemical properties, namely water solubility and the octanol:water partition coefficients. 20 refs., 3 figs., 1 tab.

134 (INIS-mf–13372) **Second workshop of participants in the Joint FAO-IOC-WHO-IAEA-UNEP project on monitoring of pollution in the marine environment of the West and Central African Region (WACAF/2 - first phase).** IOC workshop report. United Nations Educational, Scientific and Cultural Organization (UNESCO), 75 - Paris (France). Intergovernmental Oceanographic Commission (IOC). 1988. 51p. (CONF-8806523–: 2. workshop of participants in the joint FAO-IOC-WHO-IAEA-UNEP project on monitoring of pollution in the marine environment of the West and Central African region, Accra (Ghana), 13 Jun 1988). Order Number DE93605632. Source: OSTI; NTIS (US Sales Only); INIS.

The Second Workshop of Participants in the Joint FAO-IOC-WHO-IAEA-UNEP Project on Monitoring of Pollution in the Marine Environment of the West and Central African Region (WACAF/2) was attended by 29 participants from 10 countries (Senegal, The Gambia, Sierra Leone, Cote d'Ivoire, Ghana, Benin, Nigeria, Cameroun, Congo and Gabon). Levels of metals, chlorinated hydrocarbons and petroleum components in marine biota were discussed in seven scientific reports which were presented by the participating scientists (Cote d'Ivoire, Sierra Leone, Nigeria, The Gambia, ghana and Cameroun). Three of the presented reports were on organochlorines and four dealt with trace metal levels in marine organisms. The Representative of the International Atomic Energy Agency (IAEA) reviewed the results obtained during the data quality assurance intercalibration exercises carried out in the region during the first phase. The result received are still within acceptable range. However, there seems to be a trend for values to be higher than the range of finally certified concentrations. Considering that most results were clearly better in the second exercise, after equipment service, part of the earlier deviation might be attributed to instrument malfunctions. These results can be regarded as fairly encouraging for the future development in the West and Central African marine pollution monitoring programme. Refs, tabs.

The publication deals with the regulations on environmental data for the petroleum activity, stipulated by the Norwegian Petroleum Directorate on 1 December 1989 pursuant to Royal Decree of 28 June 1985, cf. Sections 7 and 33, cf. delegation of authority by the Ministry of Local Government and Labour of 28 June 1985. 1 tab.

136 (YMP-D–53/1988) **Inventory of volatile organic compound emissions in Finland, 1985.** Mroueh, U.M. (Helsinki Univ. of Technology, Espoo (Finland). Chem. Lab.). Ministry of the Environment, Helsinki (Finland). Environmental Protection Dept. 1988. 34p. Order Number DE93711140. Source: OSTI; NTIS; INIS.

The aim of the study was to compile an inventory of the emissions of volatile organic compounds in Finland for the year 1985. The report was prepared for the ECE Task Force on Emissions of Volatile Organic Compounds from Stationary Sources according to the classification given by the Task Force. It considers anthropogenic as well as natural sources. Mobile sources are excluded. The quantities as well as the main components are listed, as far as possible. The values given exclude methane which according to the present understanding is regarded as unreactive.

Source: Micromedia Ltd., Technical Information Centre, 165 Hotel de Ville, Place du Portage, Phase 2, Hull, Quebec, Canada J8X 3X2. Prices: PC $6.00 CAN; MF $4.00 CAN.

An environmentally safe apparatus for the containment and transportation of oil and liquid fuels is comprised of an inner bladder and an outer covering of stainless steel mesh around the inner bladder and molded at the filler/vent fitting to prevent tearing. The inner bladder is made of half-inch neoprene rubber for containment of 25,000 imperial gallons. The steel mesh outer covering is designed to protect the inner bladder in case of accidents which could cause tearing of the bladder. The containment bladder of the invention is designed to be incorporated into existing tanker holds and thus eliminate the need for double hulling. 1 fig.

Progress reports are presented for the following two tasks: development of analytical methodology for analysis of heavy crudes; and thermochemistry and thermophysical properties of organic nitrogen- and diheteroatom-containing compounds. Objectives for task one are: to identify compounds or classes of compounds with significant positive or negative effects on crude oil and/or product properties and characteristics and to develop methods for their determination in conventional or low grade petroleum and syncrudes. Specific objectives for FY92 are: to determine catalytic cracking behavior of individual compound classes in petroleum; and to further develop GC/MS methodology for speciation of nitrogen and sulfur compound in petroleum. Objective for task two is to provide, interpret, and correlate with molecular structure and polarity of molecules, precise and accurate values of thermodynamic properties of organic nitrogen and diheteroatom-containing compounds that occur in or are readily derivable from heavy petroleum and oil shale. The results will enable the prediction of chemical equilibria for conceptual as well as current processes.(AT)

139 (DOE/MC/24120–3121) **Results of field verification tests in the Tight Mesaverde Group: Piceance Basin, Colorado: Final report.** Kukal, G.C.; Price, E.H.; Hill, R.E.; Monson, E.R. CER Corp., Las Vegas, NV (United States). Aug 1992. 153p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC21-88MC24120. Order Number DE93000201. Source: OSTI; NTIS; GPO Dep.

The Piceance Basin of western Colorado contains a major potential natural gas resource in Mesaverde blanket and lenticular low permeability gas sands. The basin has been a pilot study area for government sponsored tight gas sand research for over 20 years. This work culminated in the Multiwell Experiment (MWX), a field laboratory consisting of three closely spaced wells, designed by the Department of Energy to study the reservoir and production characteristics of the low permeability sands of the Mesaverde Group in the Rulison Field near Rifle, Colorado. The purpose of this study is to compare geologic, production and reservoir characteristics of the existing Mesaverde producing areas in the Piceance Basin with those same characteristics at the Multiwell site. This study has been performed in two sequential parts, Phase I and Phase II. In Phase I the geologic, production and reservoir engineering parameters were developed for the existing Mesaverde gas producing areas through analysis of log suites, well completion information and production histories. The southern part of the basin was partitioned into three areas having similar geologic and production characteristics. Phase II consisted of field verification tests with cooperative industry partners in which new subsurface geologic and production information was collected in the partitioned areas to be compared with that at MWX. This report presents the results of Phase II investigations.

140 (DOE/MC/26024–3109) **Slant hole completion test (1991) sidetrack "as built" report.** Myal, F.R. CER Corp., Las Vegas, NV (United States). May 1992. 132p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC21-90MC26024. Order Number DE92012452. Source: OSTI; NTIS; GPO Dep.

During the summer of 1990, a slant hole test well, funded by the US Department of Energy, was drilled to 9,466 ft to evaluate the effectiveness of directional drilling in the tight, naturally fractured gas sands and coals of the Mesaverde Group. The surface location of the SHCT No. 1 is 700 ft south of the DOE Multiwell Experiment (MWX) site in Section 34, T6S, R94W, Garfield County, Colorado, approximately 7.5 miles west of Rifle. Mechanical problems following cementing of a production liner resulted in loss of the completion interval, and operations were suspended. In early 1991, DOE decided to sidetrack the hole to permit production testing of the lost interval. The sidetrack was designed to parallel the original wellbore, but to be drilled 1,000 ft to the east to minimize the chances of encountering formation damage from the original hole. The sidetrack, like the original hole, was to intersect the paludal lenticular sands and coals at 60° and to penetrate the underlying Cozzette sand horizonally. The sidetrack was spudded May 12, 1991. After re-entering the well in late 1991, early production testing of the Cozzette showed that the 300 ft of in-pay horizontal hole can produce at rate 5 to 10 times higher than vertical wells in the same area. This report contains the geological summary and sidetrack drilling operations summary.

141 (DOE/MC/27260–92/C0043) **Horizontal drilling in shallow, geologically complex reservoirs.** Venable, S.D. Hillin-Simon Oil Co., Midland, TX (United States). [1992]. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC21-91MC27260. (CONF-920584–12: US Department of Energy contractor review meeting on natural gas research and development, Morgantown, WV (United States), 5-6 May 1992). Order Number DE93001426. Source: OSTI; NTIS; GPO Dep.

The objective of this project is to test the concept that multiple hydraulic fracturing from a directionally-drilled horizontal well, using the medium radius build rate method, can increase gas production sufficiently to justify economic viability over conventional stimulated vertical wells. The test well is located in Yuma County, Colorado, in a favorable area of established production to avoid exploration risks. This report presents: background information; project description which covers location selection/geologic considerations; and preliminary work plan. (AT)

142 (DOE/MC/28080–92/C0066) **Ground movements associated with gas hydrate production.** Siriwardane, H.J. West Virginia Univ., Morgantown, WV (United States). Coll. of Engineering. [1992]. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG21-91MC28080. (CONF-920584–29: US Department of Energy contractor review meeting on natural gas research and development, Morgantown, WV (United States), 5-6 May 1992). Order Number DE93000398. Source: OSTI; NTIS; GPO Dep.

The mechanics of ground movements during hydrate production can be more closely simulated by considering similarities with ground movements associated with subsidence in permafrost regions than with gob compaction in a longwall mine. The purpose of this research work is to investigate the potential strata movements associated with hydrate production by considering similarities with ground movements in permafrost regions. The work primarily involves numerical modeling of subsidence caused by hydrate dissociation. The investigation is based on the theories of continuum mechanics , thermomechanical behavior of frozen geo-materials, and principles of rock mechanics and geomechanics. It is expected that some phases of the investigation will involve the use of finite element method, which is a powerful computer-based method which has been widely used in many areas of science and engineering. Parametric studies will be performed to predict expected strata movements and surface subsidence for different reservoir conditions and properties of geological materials. The results from this investigation will be useful in predicting the magnitude of the subsidence problem associated with gas hydrate production. The analogy of subsidence in permafrost regions may provide lower bounds for subsidence expected in hydrate reservoirs. Furthermore, it is anticipated that the results will provide insight into planning of hydrate recovery operations.

143 (DOE/MC/28239–92/C0067) **Horizontal drilling in the Lower Glen Rose Formation, Maverick County, Texas.** Drimal, C.E.; Muncey, G. PrimeEnergy Corp., Stamford, CT (United States). [1992]. 24p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC21-91MC28239. (CONF-920584–30: US Department of Energy contractor review meeting on natural gas research and development, Morgantown, WV (United States), 5-6 May 1992). Order Number DE93001427. Source: OSTI; NTIS; GPO Dep.

This paper presents preliminary results of a project to assess the economic viability of horizontal drilling in the Lower Glen Rose Formation of Maverick County, Texas. This project is part of an ongoing Department of Energy investigation of directional drilling in the development of gas resources within the United States. The paper includes: project description; results covering geologic setting, reservoir engineering, and seismic surveys; and future work on drilling location selection, drilling, and well completion. (AT)

144 (EUR–13926) **Low temperature preparation of physical solvents for the treatment of natural gas. Final report.** Larue, J. (Institut Francais du Petrole (IFP), 92 - Rueil-Malmaison (France)); Lermite, C. Commission of the European Communities, Luxembourg (Luxembourg). 1992. 42p. (In French). Contract EN3C-0033-F. Source: OSTI; NTIS (US Sales Only).

The aim of this project was to select and study physical solvents which can be employed at low temperature for the treatment of natural gas. These solvents will enable deacidification, dehydratation and removal of liquids to be carried out simultaneously, in a single step, cooling the natural gas on contact with the solvent. Two classes of solvents were considered: heavy solvents that

can be regenerated by distillation, a class including N-methylpyrrolidone, dimethylformamide and N-formylmorpholine, and the class of light solvents that can be regenerated by stripping the crude gas; in the latter class only methanol was considered. After an extensive study of the literature, complementary measurements, mainly consisting of equilibrium data, were carried out. In the course of the project, use of heavy solvents was abandoned and attention devoted entirely to methanol, which is plainly the best solvent for the above mentioned integrated process. Several thermodynamic models were tested on the complex multiphase equilibria involved, including the formation of hydrates at high inhibitor concentrations. Depending on the conditions, some of the more complex models can give good results, but none can represent accurately all the data gathered during this project. Generally, however, the data give sufficient indication that the integrated gas treatment process is thermodynamically viable. 11 refs., 14 figs., 3 tabs., 4 plates, 6 appendices.

0304 Products and By-Products

145 (NEI-NO–287) **Oligomerization of ethene on zeolite ZSM-5 type catalysts.** Dypvik, T. Trondheim Univ. (Norway). Norges Tekniske Hoegskole. 1992 173p. Order Number DE93721667. Source: OSTI; NTIS.

Oligomerization of ethene was performed with zeolite ZSM-5 catalysts. Activity and selectives of the catalysts as a function of reaction temperature in the temperature range 550-750 K were investigated in a microreactor. Some experiments were also performed at temperatures outside this range, and some experiments were performed varying the WHSV (Weight Hourly Space Velocity) and the partial pressure of ethene. A microbalance reactor was used for investigation of the coke formation during reaction. The zeolites were synthesized, and characterized with regard to crystallinity, specific surface area, morphology and chemical composition of the surface and bulk. In addition to HZSM-5, Sm-HZSM-5 and Nb-HZSM-5 were made. All three zeolites were ion-exchanged with nickel, HZSM-5 also with copper. For all the catalysts the ethene conversion increased with increasing reaction temperature until the temperature reached 650-700 K. Further increase of the reaction temperature led to decreased conversion. The decrease in conversion was not due to catalyst deactivation, as decreasing the temperature again, without catalyst regeneration, led to increased conversion. No indications were found for thermodynamic constraints limiting the conversion of ethene at high reaction temperature. A close relation was found between the catalytic stability obtained in the microreactor, and the catalyst weight increase under reaction conditions obtained in the microbalance reactor. This indicates the weight increase to be due, at least partly, to the formation of coke, which deactivated the catalyst. 108 refs., 80 figs., 18 tabs.

146 (DOE/EIA–0130(92/09)) **Natural gas monthly, September 1992.** USDOE Energy Information Administration, Washington, DC (United States). Office of Oil and Gas. 24 Sep 1992. 140p. Sponsored by USDOE, Washington, DC (United States). Order Number DE93001253. Source: OSTI; NTIS; GPO; GPO Dep.

The Natural Gas Monthly (NGM) is prepared in the Data Operations Branch of the Reserves and Natural Gas Division, Office of Oil and Gas, Energy Information Administration (EIA), US Department of Energy (DOE). The NGM highlights activities, events, and analyses of interest to public and private sector organizations associated with the natural gas industry. Volume and price data are presented each month for natural gas production, distribution, consumption, and interstate pipeline activities. Producer-related activities and underground storage data are also reported. From time to time, the NGM features articles designed to assist readers in using and interpreting natural gas information.

0310 Legislation and Regulations

147 (EUR–13699) **Community documentation centre on industrial risk. Comparison of Liquefied Petroleum Gases (LPG) - related regulations.** Harris, S.; Arregger, J.E.; Trbojeric, V.M.; Cox, R.A. Commission of the European Communities, Luxembourg (Luxembourg). 1991. 356p. Contract 4019-90-06 ED ISP GB. Source: OSTI; NTIS (US Sales Only).

The Community Documentation Centre on industrial Risk (CDCIR), in addition to the collection of safety related documentation has in its objectives the production of review publications. Studies on, lessons learned from major accidents in the Community Member Countries, lessons learned after emergencies and a comparison of the national approaches to the safety report have been already published. This volume is the first one for the comparison of regulations and guidelines for handling and storing a specific substance. LPG being a flammable gas is a dangerous substances under the definitions given in the SEVESO-Directive. Its selection does not imply that is more dangerous than any other of the substances either explicitly listed in Annexes II and III, or classified as dangerous according to the criteria of Annex IV of this Directive. It mainly reflects the fact that it is widely used all over the Community (installations handling or storing LPG covered by the requirements of the SEVESO-Directive are to be found in all Member Countries) and consequently is involved very frequently in accidents. It is hoped that this publication will be helpful for the authorities and other interested bodies for the approximation of the national approaches to safety.

148 (NEI-NO–286) **Gas tightness of unlined hard rock caverns.** Kjoerholt, H. Trondheim Univ. (Norway). Norges Tekniske Hoegskole. 1991 207p. Order Number DE93721666. Source: OSTI; NTIS.

The storage of natural gas in depleted oil and gas fields, aquifers and salt caverns is by far the most important field of underground gas storage today. In many areas, including most of the Scandinavian mainland, these storages are excluded due to geological conditions. For such areas, mined caverns in the hard, crystalline bedrock may provide an alternative. Oil and liquefied petroleum gases (LPG) at low pressure (<1.0 megapascal (MPa)) are routinely stored in excavated hard rock caverns. The major challenge in hard rock storages at present is the development of safe and economical high pressure storages for natural gas and CAES (Compressed Air Energy Storage). For the investigation of the performance of unlined hard rock storages, so-called air cushion surge chambers are found to provide the most relevant and extensive experience. These storages which have the function of damping transients in the head race tunnel at Norwegian hydro power plants, have pressures up to 8 MPa and volumes up to 110,000 m^3. Operational experience and results from specific water curtain tests at these sites, and other relevant experience are found to be in good agreement with theoretical results. Water curtains are installed at three of the ten air cushion surge chambers and at more than ten LPG-storages. The overall experience from these installations is encouraging; gas leakage has not been reported at any of these sites during ordinary operation. 91 refs., 77 figs., 14 tabs.

149 (FRNC-TH–3721) **Phosphates and blackshales of the Oulab Abdoun and Timahdit basins (Morocco): Petrography, mineralogy, geochemistry and depositional environment.** Benalioulhaj, N. Strasbourg-1 Univ., 67 (France). Oct 1991. 261p. (In French). Order Number DE93721352. Source: OSTI; NTIS (US Sales Only).

The blackshale series of the Timahdit Basin represents a lateral synchronous facies of the phosphate series of the Oulad-Abdoun Basin. The Timahdit Basin is made up of an unstable and subsiding domain, while the Oulad-Abdoun Basin is part of a stable platform. The deposit is thicker, monotonous and rich in organic matter at Timahdit, whereas at Oulad-Abdoun, the deposit is of a reduced thickness, more diversified and rich in phosphates. These two basins belong to the same palaeographic domain, to the same marine paleogulf, which was under the influence of the same system of upwelling, more active in the Oulad-Abdoun Basin than in the Timahdit Basin which is situated landwards. These two basins have evolved in a globally reduced environment. In the Oulad-Abdoun Basin, frequent variations of redox conditions are responsible for the lithologic variety. The quasi-permanent anoxic conditions that have prevailed in the Timahdit Basin are marked by a poor preservation of dinocysts and by a low degree of carbonate substitution in the apatites. The diagenetic evolution of the organic matter has led to some mineral neoformations (apatites, sulphides, carbonates and clays) and has regulated the distribution of trace elements among the mineral phases from the stage of deposition of these series to their alteration. 255 refs., 61 figs., 38 tabs.

150 (DOE/MC/11089–3094-Vol.3) **Pressurized fluidized-bed hydroretorting of eastern oil shales: Volume 3, Task 4, Beneficiation research: Final report, September 1987–May 1991.** Institute of Gas Technology, Chicago, IL (United States). Mar 1992. 254p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC21-87MC11089. Order Number DE92001285. Source: OSTI; NTIS; GPO Dep.

The Mineral Resources Institute at the University of Alabama, along with investigators from the University of Pittsburgh and the University of Nevada Reno, have conducted a research program on the beneficiation of Eastern oil shales. The objective of the research program was to evaluate and adapt those new and emerging technologies that have the potential to improve the economics of recovering oil from Eastern oil shales. The technologies evaluated in this program can be grouped into three areas: fine grinding, kerogen/mineral matter separation, and waste treatment and disposal. Four subtasks were defined in the area of fine grinding. They were as follows: Ultrasonic Grinding, Pressure Cycle Comminution, Stirred Ball Mill Grinding, and Grinding Circuit Optimization. The planned ultrasonic grinding research was terminated when the company that had contracted to do the research failed. Three technologies for effecting a separation of kerogen from its associated mineral matter were evaluated: column flotation, the air-sparged hydrocyclone, and the LICADO process. Column flotation proved to be the most, effective means of making the kerogen/mineral matter separation. An investigation of waste treatment and disposal was conducted at the University of Alabama. Both liquid (water) and solid (tailings) wastes were investigated. Ion exchange and sulfide precipitation both proved to be effective in removing dissolved ions from tailing water. No problems are expected in the disposal of oil shale tailings. It is assumed that the tailings will be placed in a sealed pond and the water recycled to the plant as is the normal practice. It may be advantageous, however, to conduct further research on the recovery of metals as by-products and to assess the market for tailings as an ingredient in cement making.

151 (DOE/MC/11089–3107) **Pressurized fluidized-bed hydroretorting of Eastern oil shales – Sulfur control: Topical report for Subtask 3.1, In-bed sulfur capture tests; Subtask 3.2, Electrostatic desulfurization; Subtask 3.3, Microbial desulfurization and denitrification.** Roberts, M.J. (Institute of Gas Technology, Chicago, IL (United States)); Abbasian, J.; Akin, C.; Lau, F.S.; Maka, A.; Mensinger, M.C.; Punwani, D.V.; Rue, D.M.; Gidaspow, D.; Gupta, R.; Wasan, D.T.; Pfister, R.M.: Krieger, E.J. Institute of Gas Technology, Chicago, IL (United States); Illinois Inst. of Tech., Chicago, IL (United States); Ohio State Univ., Columbus, OH (United States). May 1992. 240p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC21-87MC11089. Order Number DE92041343. Source: OSTI; NTIS; GPO Dep.

This topical report on "Sulfur Control" presents the results of work conducted by the Institute of Gas Technology (IGT), the Illinois Institute of Technology (IIT), and the Ohio State University (OSU) to develop three novel approaches for desulfurization that have shown good potential with coal and could be cost-effective for oil shales. These are (1) In-Bed Sulfur Capture using different sorbents (IGT), (2) Electrostatic Desulfurization (IIT), and (3) Microbial Desulfurization and Denitrification (OSU and IGT). The objective of the task on In-Bed Sulfur Capture was to determine the effectiveness of different sorbents (that is, limestone, calcined limestone, dolomite, and siderite) for capturing sulfur (as H_2S) in the reactor during hydroretorting. The objective of the task on Electrostatic Desulfurization was to determine the operating conditions necessary to achieve a high degree of sulfur removal and kerogen recovery in IIT's electrostatic separator. The objectives of the task on Microbial Desulfurization and Denitrification were to (1) isolate microbial cultures and evaluate their ability to desulfurize and denitrify shale, (2) conduct laboratory-scale batch and continuous tests to improve and enhance microbial removal of these components, and (3) determine the effects of processing parameters, such as shale slurry concentration, solids settling characteristics, agitation rate, and pH on the process.

153 **Process for the selective conversion of the asphaltenes in bitumen upgrading.** Smith, K.J.; Ng, C. 11 Jul 1992. Filed date 10 Jan 1991. Canada Patent patent application 2033965. 17p. Source: Micromedia Ltd., Technical Information Centre, 165 Hotel de Ville, Place du Portage, Phase 2, Hull, Quebec, Canada J8X 3X2. Prices: PC $6.00 CAN; MF $4.00 CAN.

A process is provided for selectively converting the asphaltenic fraction of a bitumen feedstock to lower boiling point distillates. According to the invention, the bitumen feedstock is reacted with hydrogen under hydrocracking conditions in the presence of a metal hydrotreating catalyst on a delaminated pillared clay catalyst support. The reaction temperature is preferably 430-450°C and the catalyst is selected from the group comprising Co, Mo, Ni, Fe, or W, or mixtures thereof. The catalyst support is prepared from smectite clays, preferably bentonite. Suitable pillaring agents include Al, Cr, Zr, Fe, Ga, or Ti. The catalyst support is characterized by having a bimodal pore size distribution in which at least 40% of the total volume resides in pores having an average diameter > 50 nm and at least 20% of the pore volume resides in pores having an average diameter < 2 nm. Experiments are described to illustrate the process of the invention. 7 tabs.

154 **Use of two or more nested apertured endless belts with inverted arch bottom flights and generally horizontal top flights to recover bitumen and minerals.** Kruyer, J. 28 Jun 1992. Filed date 27 Dec 1990. Canada Patent patent application 2033217. 83p. Source: Micromedia Ltd., Technical Information Centre, 165 Hotel de Ville, Place du Portage, Phase 2, Hull, Quebec, Canada J8X 3X2. Prices: PC $6.00 CAN; MF $4.00 CAN.

A process and apparatus for the recovery of bitumen and bitumen-wetted minerals from separating mixtures of bitumen, bitumen-wetted minerals, water, and water-wetted minerals uses two or more nested apertured endless belts on conveyor supports that support these belts to form top flights approaching generally horizontal paths above the separating mixture and bottom flights in the form of or approaching inverted arches immersed in the separating mixture. Bitumen separates from a mixture, is captured by and adheres to belt surfaces as the mixture passes through bottom flight apertures, and is conveyed to corresponding top flights where it falls off into receptacles and/or is washed off with water. Mixture that has passed through apertures of the bottom flight of a first belt may be passed through apertures of the bottom flight of a second belt, nested with the first belt, for additional bitumen capture, or is removed. Bitumen washed off with water from the top flights of a first and/or second belt is removed for further processing or is passed to an inside enclosure that contains a third belt, nested with the first and/or second belts, to yield a final bitumen product that is low in hydrophilic minerals. Alternatively, the mixture may be introduced into the volume between the bottom flights of two nested belts and flow through the apertures of both bottom flights simultaneously. 13 figs.

155 (INFO–0386) **An evaluation of the dissolution process of natural uranium ore as an analogue of nuclear fuel.** Stern, V.H. Atomic Energy Control Board, Ottawa, ON (Canada). Aug 1991. 52p. Project 5.139.1. Order Number DE93603216. Source: OSTI; NTIS (US Sales Only); INIS.

The assumption of congruent dissolution of uraninite as a mechanism for the dissolution behaviour of spent fuel was critically examined with regard to the fate of toxic radionuclides. The fission and daughter products of uranium are typically present in spent unreprocessed fuel rods in trace abundances. The principles of trace element geochemistry were applied in assessing the behaviour of these radionuclides during fluid/solid interactions. It is shown that the behaviour of radionuclides in trace abundances that reside in the crystal structure can be better predicted from the ionic properties of these nuclides rather than from assuming that they are controlled by the dissolution of uraninite. Geochemical evidence from natural uranium ore deposits (Athabasca Basin, Northern Territories of Australia, Oklo) suggests that in most cases the toxic radionuclides are released from uraninite in amounts that are independent of the solution behaviour of uranium oxide. Only those elements that have ionic and thus chemical properties similar to U^{4+}, such as plutonium, americium, cadmium, neptunium and thorium can be satisfactorily modelled by the solution properties of uranium dioxide and then only if the environment is reducing. (84 refs., 7 tabs.).

157 (KAERI/RR–1007/91) **Development of nuclear fuel. Development of laser spectroscopic technology in nuclear industry.** Lee, Jong Min (Korea Atomic Energy Research Inst., Daeduk (Korea, Republic of)); Cha, Hyung Ki; Kim, Chul Jung. Korea Atomic Energy Research Inst., Daeduk (Korea, Republic of). Apr 1991. 197p. (In Korean). Order Number DE93605650. Source: OSTI; NTIS (US Sales Only); INIS.

The goal of the project is to establish database of the spectroscopic parameters of heavy atomic elements by using RIS technology. To achieve the maximum efficiency of photoionization processes, several lasers were used and some equipment which need be according to the experimental purposes were self-constructed: that is, a real time TOF mass spectrometer and a frequency stabilizer for a pulsed dye laser were devised. Multistep photoionization experiments of Hg atoms were carried out with these equipments. Also computer code, MCDF, was executed for the calculation of transition probabilities of Hg atoms. (Author).

158 (AECL–10438) **Fission-product releases from UO_2 in air and inert conditions at 1700-2350 K: Analysis of the MCE-1 experiment.** Cox, D.S. (Atomic Energy of Canada Ltd., Chalk River, ON (Canada). Chalk River Nuclear Labs.); Hunt, C.E.L.; Liu, Z.; Keller, N.A.; Barrand, R.D.; O'Connor, R.F.; Iglesias, F.C. Atomic Energy of Canada Ltd., Chalk River, ON (Canada). Chalk River Nuclear Labs. Jul 1991. 23p. (CONF-910714–: International topical meeting on safety of thermal reactors, Portland, OR (United States), 21-25 Jul 1991). Order Number DE93603814. Source: OSTI; NTIS (US Sales Only); INIS.

The kinetics of fission-product releases from UO_2 were measured in inert and oxidizing conditions during an in-cell post-irradiation annealing experiment. Eight individual tests were performed using irradiated UO_2 heated in a mixture of argon/2% hydrogen to a maximum temperature of between 1975 and 2350 K, followed by annealing for 25 minutes, then cooling. In some of the tests, the UO_2 was exposed to air for 15 minutes during the annealing period. By changing from inert to oxidizing conditions,

the release rates of I, Cs, Ru and Nb were increased. In oxidizing conditions, Ru was released more rapidly than I or Cs. High rates of UO_2 volatilization occurred in the oxidizing tests, and resulted in greater than 50% release of the low-volatility Zr, La and Ce fission products. Above about 2200 K, significant released of Ba were observed, in both oxidizing and inert conditions. Effective diffusion coefficients for I, Cs and Ba are reported and small but measurable differences in Cs-134 versus Cs-137 behaviour are discussed. Calculations using the CORSOR-M model were in reasonable agreement with the measured kinetics of I and Cs release, but Ba releases were significantly underpredicted at temperatures above 2200 K. (15 refs., 14 figs., tab.).

174 (KAERI/RR–1056/91) **High density UO_2 powder preparation for HWR fuel.** Hwang, S. T. (Korea Atomic Energy Research Inst., Daeduk (Korea, Republic of)); Chang, I. S.; Choi, Y. D.; Cho, B. R.; Kwon, S. W.; Kim, B. H.; Moon, B. H.; Kim, S. D.; Phyu, K. M.; Lee, K. A. Korea Atomic Energy Research Inst., Daeduk (Korea, Republic of). Jan 1992. 60p. (In Korean). Order Number DE93605763. Source: OSTI; NTIS (US Sales Only); INIS.

The objective of this project is to study on the preparation of method high density UO_2 powder for HWR Fuel. Accordingly, it is necessary to character ize the AUC processed UO_2 powder and to search method for the preparation of high density UO_2 powder for HWR Fuel. Therefore, it is expected that the results of this study can effect the producing of AUC processed UO_2 powder having sinterability. (Author).

175 (ARH–61-Del.) **200 Areas operation monthly report, November 1967.** Atlantic Richfield Hanford Co., Richland, WA (United States). 22 Dec 1967. 45p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE92019773. Source: OSTI; NTIS (US Sales Only); GPO Dep.

CPD manufacturing plants operated satisfactorily. Production of all products met all forecasts, despite the N-Reactor strike. Blending and casting of Pu ingots for ZPPR resumed on Nov. 20. Both 242-T Waste Evaporator and In-Tank Solidifcation unit performed well. Testing of Phase III equipment at B Plant continued. The Cell 23 waste concentrator at B Plant evaporated 591,000 gal waste, despite outages. Decontamination of Semiworks is almost complete. 106,000 Ci of cesium-137 was shipped to ORNL. 1.3 MCi of cerium-144 was recovered from Purex high-level waste and shipped to Battelle-Northwest. 241 g Pu-238 was processed to the oxide and shipped to Miamisburg. The prototype scrubber humidifier has operated satisfactorily in a test in the off-gas train of the No. 1 In-Tank Solidification unit. Light Th oxide pellets have been produced for target elements. Training of chemical operators began Nov. 1. (DLC)

176 (ARH–303-Del.) **200 Areas operation monthly report, April 1968.** Atlantic Richfield Hanford Co., Richland, WA (United States). 22 May 1968. 49p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE92040629. Source: OSTI; NTIS (US Sales Only); GPO Dep.

Operation of 200 Area production facilities was satisfactory; Pu and U product outputs met or exceeded April requirements. Purex processing of N-Reactor coproduct blend was completed; processing of normal U fuels containing nondefense grade Pu was started. 94-210 UNH feed from Purex was calcined in Uranium Oxide Plant; calcination was started on normal depleted UNH feed. The Pu processing facility operated on defense grade Pu feed through April 19; the system was then cleaned out for non-defense Pu button production. Operations in Pu recovery facilities were hampered. Blending and casting of Pu ingots for ZPPR continued. Solvent extraction of Purex current acid waste in B Plant resulted in Sr recoveries of 90-95%. 1.4 MCi of cesium-137 were added to storage from the B Plant cesium ion exchange processing of supernate waste. In-tank solidification units No. 1 and 2 had on-line efficiencies of 77 and 93%. The 242-T waste evaporator was shut down April 23 for maintenance. Two casks, each loaded with I.5 MCi cerium-144, were shipped. Causes of exothermic reactions during processing of high-exposure, long-cooled N-Reactor fuels are being studied. Cd nitrate is being tested as neutron poison in Purex Plant. A process test was conducted in Reclamation facility for Pu recovery and partitioning from mixed U-Pu scrap. (DLC)

177 (ARH–305-Del.) **200 Areas operation monthly report, June 1968.** Atlantic Richfield Hanford Co., Richland, WA (United States). 22 Jul 1968. 47p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE92040630. Source: OSTI; NTIS (US Sales Only); GPO Dep.

Operation of 200 Areas production facilities was satisfactory; Pu and U product output exceeded schedules. Purex processing of normal U containing defense grade Pu was completed and a planned outage started. Uranium Oxide plant performed well, processing normal depleted UNH feed. Operations in the Pu recovery and processing facilities were also satisfactory,as were waste management activities at B plant. The 2nd campaign for processing Purex current acid waste by solvent extraction was started. In June, 107,000 gal supernate waste were processed in the B Plant cesium ion exchange unit. The 242-T waste evaporator performed well. The immersion heater shorted out in in-tank solidification unit No. 1 June 13. ITS-2 was shut down June 26. Casks of sulfate-free waste were shipped to Battelle-Northwest; waste casks were received from there and sent to underground storage. The HS scrub column in Purex first decontamination and partition cycle was bypassed in preparation for removal. Contents are being removed from Tank 241-A-105 which has a bulged liner. 6 g Rh was shipped. Training and testing of the first generation of Lead Nuclear Chemical Operator candidates was completed. (DLC)

178 (ARH–1101-Del.) **200 Areas operation monthly report, February 1969.** Atlantic Richfield Hanford Co., Richland, WA (United States). 21 Mar 1969. 46p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE92040631. Source: OSTI; NTIS (US Sales Only); GPO Dep.

Although Feb. was a low-volume production month, deliveries met schedule. Processing of high Pu-240 grade Pu in Purex plant was completed. After turnaround, processing of low-pressure reactor Al-clad U containing fuel-grade Pu was started. Operations in Pu processing and recovery facilities had a few outages. Removal of Tank 241-AX-101 as the B Plant fractionation waste receiver on Jan. 26 required expediting several special activities. More than 2,800 kCi cesium 137 were removed from 333,000 gal aged supernatant waste feed. Total space recovered in the tank farm by Redox evaporators, ITS-1, ITS-2, and 242-T was 1,164,000 gal (total for FY 1969 8,343,000 gal). 1,200 g Np were calcined and shipped. 28 kCi Sr-90 was shipped. A project proposes to provide a 7500 ft deep well for feasibility study of radwaste storage in deep basalt caverns under Hanford. (DLC)

179 (ARH–1103-Del.) **200 Areas operation monthly report, April 1969.** Atlantic Richfield Hanford Co., Richland, WA (United States). 22 May 1969. 55p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE92040632. Source: OSTI; NTIS (US Sales Only); GPO Dep.

April output of Pu and U products was slightly below forecast, owing to Purex outage extension. The 4th coproduct blend processing campaign was started in Purex plant April 14; processing of final coproduct material from N Reactor proceeded smoothly.

Transfer of stored, depleted natural U oxide to Paducah KY was started. Operations in Pu processing and recovery facilities were satisfactory. At B Plant, solvent extraction processing of Purex current acid waste (CAW) was resumed; routine removal of Cs from CAW was begun. Ion Exchange processing was interrupted in B Plant to replace the zeolite bed. Total space recovered by Redox evaporators and by ITS-1, ITS-2 and 242-T was 1,307,000 gal during this month. The exploratory well for feasibility of radwaste storage reached a depth of 364 ft. (DLC)

180 (ARH–1104-Del.) **200 Areas operation monthly report, May 1969.** Atlantic Richfield Hanford Co., Richland, WA (United States). 23 Jun 1969. 49p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE92040633. Source: OSTI; NTIS (US Sales Only); GPO Dep.

Operation of Area 200 production facilities was satisfactory; major product output schedules were met or exceeded. Final chemical processing activities in support of the N Reactor coproduct demonstration program were completed; processing and blending the enriched U was successful. Transfer of stored, depleted natural U oxide to Paducah KY accelerated. The Pu reclamation facility operated without interruption, on weapons-grade Pu scrap. Waste management activities at B Plant were satisfactory. Operation of the B Plant Cs ion exchange unit was resumed after the zeolite bed replacment; a record processing rate of 200,000 gal of aged supernatant waste feed was achieved. Total space recovered in the tank farm was 1,444,000 gal for the month; a record total boiloff was achieved for the second consecutive month. Sluicing of sludge in Tank 241-104-A to Tank 241-106-A was started. Annual audit and review of the nuclear criticality control program was completed. (DLC)

181 (ARH–1105-Del.) **200 Areas operation monthly report, June 1969.** Atlantic Richfield Hanford Co., Richland, WA (United States). 23 Jul 1969. 48p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE92040634. Source: OSTI; NTIS (US Sales Only); GPO Dep.

The first cycle waste concentrator was discovered to be leaking in Purex plant; the outage was extended. The U oxide plant completed calcining the last of coproduct 210-94 blend material. Transfer of stored depleted natural U oxide to KY was completed. Operations in Pu processing and reclamation facilities were satisfactory. At B plant, solvent extraction processing of Purex CAW was conducted June 9–23; 5 mCi cerium-144 were segregated from the acid waste. The cesium ion exchange unit perfomed better since the column zeolite bed was replaced. The PTA (phosphotungstic acid) process for Cs removal from CAW resulted in low Cs recovery. Operations in waste tank space recovery program continued. 300 kCi cobalt-60 in discarded shroud tubes were disposed of. Hot water were used to try to soften the sludge in Tank 241-104-A. The exploratory well reached a depth of 3,365 ft. (DLC)

182 (ARH–1502-Del.) **200 Areas operation monthly report, February 1970.** Atlantic Richfield Hanford Co., Richland, WA (United States). 24 Mar 1970. 46p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE92040918. Source: OSTI; NTIS (US Sales Only); GPO Dep.

This was a low-volume production month. Processing of weapons-grade Pu in Purex was completed Feb. 5, and dissolution of PRTR fuels was started on Feb. 26. The enriched U oxide powder produced in the U Oxide Plant was milled and loaded for shipment to Fernald. Operations in the Pu processing facility were limited to about 1 week owing to lack of feed; weapons-grade Pu metal was produced. The weapons-grade Pu recovered in the Pu reclamation facility exceeded specified P and Si contents; it will be reprocessed. A process test on the reburning of incinerator ash was completed, with a 36% reduction in ash weight. The Cs ion exchange unit was out of service most of the month in B Plant. The 1st solvent extraction campaign to process PAS from the sulfate precipitation head-end process was completed, with >95% of the Sr removed from 11,000 gal. The 2nd CY 1970 solvent extraction campaign for Purex CAW was interrupted for a week. Boiloff rates at 242-T evaporator were limited to about 60% capacity; total space recovered by Redox evaporators and ITSs-1, ITS-2 and 242-T was 851,000 gal in Feb. (DLC)

183 (ARH–1905-Del.) **200 Areas operation monthly report, May 1971.** Atlantic Richfield Hanford Co., Richland, WA (United States). 18 Jun 1971. 54p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE92040922. Source: OSTI; NTIS (US Sales Only); GPO Dep.

Operation of production facilities in 200 Areas were satisfactory; major product output schedules were met. The 3A feed pump failed and was replaced in Purex plant during processing of Al-clad natural U; the 2nd U cycle equipment was flushed as well; and processing was resumed May 13. The U Oxide Plant resumed calcining operations May 4; hoppers were filled with milled U oxide powder. The Pu processing and reclamation facilities operated the entire month, producing and recovering weapons-grade Pu. Solvent extraction processing of Purex CAW in B Plant was completed May 23; about 2.9 MCi Pm-147 and 18.8 MCi Ce-144/Pr were collected. 395,000 gal Redox waste supernatants from 241-SX tank farm were processed and 710kCi Cs-137 added to product storage. ITS-2 was out of service while excess solids was removed from the tank. Total space recovered by Redox evaporators and ITS-1, ITS-2 and 242-T was 618,000 gal, bringing the total for FY 1971 to 11,404,000 gal. The HAPO 1B-1 cask, loaded with 600 kCi Sr-90, was released for shipment to ORNL. The Tank Farm Management Subsection and the projected Encapsulation facility were realigned under Purex management; the new section is designated as the Purex, Waste Encapsulation and Solidification section. (DLC)

184 (BARC–1991/E/002) **Analytical techniques for in-line/on-line monitoring of uranium and plutonium in process solutions : a brief literature survey.** Marathe, S.G. (Bhabha Atomic Research Centre, Bombay (India). Fuel Chemistry Div.); Sood, D.D. Bhabha Atomic Research Centre, Bombay (India). 1991. 35p. Order Number DE93605258. Source: OSTI; NTIS (US Sales Only); INIS.

In-line/on-line monitoring of various parameters such as uranium-plutonium-fission product concentration, acidity, density etc. plays an important role in quickly understanding the efficiency of processes in a reprocessing plant. Efforts in studying and installation of such analytical instruments are going on since more than three decades with adaptation of newer methods and technologies. A review on the developement of in-line analytical instrumentation was carried out in this laboratory about two decades ago. This report presents a very short literature survey of the work in the last two decades. The report includes an outline of principles of the main techniques employed in the in-line/on-line monitoring. (author). 77 refs., 6 tabs.

185 (BARC–1991/E/018) **Studies on resin degradation products encountered during purification of plutonium by anion exchange.** Ramanujam, A. (Bhabha Atomic Research Centre, Bombay (India). Fuel Reprocessing Div.); Dhami, P.S.; Gopalakrishnan, V.; Dhumwad, R.K. Bhabha Atomic Research Centre, Bombay (India). 1991. 29p. Order Number DE93605259. Source: OSTI; NTIS (US Sales Only); INIS.

Among the methods available for the purification of plutonium in Purex process, anion exchange method offers several advantages. However, on repeated use, the resin gets degraded due to thermal, radiolytic and chemical attacks resulting in chemical as well as physical damage. Frequently, plutonium product eluted from such resin contains significant quantities of white precipitates. A few anion exchange resins were leached with 8 M HNO_3 at 60-80degC and the resin degradation products (RDP) in the leach-extract were found to give similar precipitates with tetravalent metal ions like Pu(IV), Th(IV) etc. Tetra propyl ammonium hydroxide in 8 M HNO_3 (TPAN) also gave a white precipitate with plutonium similar to the one found in the elution streams. The results indicate that delinked quaternary ammonium functional groups might be responsible for the formation of precipitate. The characteristics of precipitates Th-RDP, Th-TPAN and that isolated from elution stream have been investigated. In a separate study a tentative formula for Th-RDP compound is proposed. The influence of RDP on the extraction of plutonium and other components in Purex process was studied and it was found that RDP complexes metal ions thus

marginally affecting the kd values. A spectrophotometric method has been standardised to monitor the extent of degradation of anion exchange resins which is based on the ability of RDP to reduce the colour intensity of Th-thoron complex. This technique can be used to study the stability of the anion exchange resins. (author). 8 refs., 8 tabs., 5 figs.

186 (BARC–1992/E/002) **Role of ion transfer membrane in the production of uranous nitrate.** Nair, M.K.T. (Bhabha Atomic Research Centre, Tarapur (India). PREFRE Plant); Singh, R.K.; Bajpai, D.D.; Venugopalan, A.K.; Singh, R.R.; Gurba, P.B.; Thomas, Mathew. Bhabha Atomic Research Centre, Bombay (India). 1992. 41p. Order Number DE93605260. Source: OSTI; NTIS (US Sales Only); INIS.

In Purex process, plutonium and uranium are co-extracted into organic phase and these are partitioned by reducing Pu(IV) to Pu(III) using hydrazine stabilized uranous nitrate solution. Usually, uranous nitrate is added in much higher quantity than the stoichiometric requirement to effect complete reduction of plutonium. In conventional electrolytic cells only 60 to 70% of uranyl to uranous conversion is achieved. Use of this solution results in dilution of plutonium product. In addition to this, each externally fed uranous nitrate batch increases uranium processing load and affects the plant throughput. In order to keep the additional uranium processing load to a minimum, it is necessary to increase the uranous content to near cent percent level in the externally fed uranous nitrate solution. The studies carried out at PREFRE (Power Reactor Fuel Reprocessing) laboratory have shown that it is possible to produce concentrated uranous nitrate solution, nearly free from uranyl nitrate, by using a cation exchange membrane. This paper describes the development work carried out at PREFRE plant, Tarapur for production of cent percent uranous nitrate solution. Development of electrolytic cells for uranous production, from laboratory scale to pilot plant scale, has been explained. (author). 24 refs., 8 figs., 8 tabs.

187 (BARC–1992/E/009) **Extraction of actinides from high level waste streams of Purex process using mixtures of CMPO and TBP in dodecane.** Mathur, J.N. (Bhabha Atomic Research Centre, Bombay (India). Radiochemistry Div.); Murali, M.S.; Natarajan, P.R. Bhabha Atomic Research Centre, Bombay (India). 1992. 31p. Order Number DE93605261. Source: OSTI; NTIS (US Sales Only); INIS.

The extraction of actinides from high-active aqueous raffinate waste (HAW) as well as high level waste (HLW) solutions arising from Purex processing of thermal reactor fuels has been studied using a mixture of octyl(phenyl)-N, N-diisobutylcarbamoylmethylphosphine oxide (CMPO) and TBP in dodecane. The results on the extraction and striping of actinides, lanthanides and other fission products have been discussed in this report and optimum conditions have been proposed for the efficient recovery of residual actinides from HAW and HLW streams by CMPO extraction and for their selective stripping with suitable reagents. Experiments on the extraction and separation of actinides and lanthanides by CMPO in the presence of TBP in dodecane have also been carried out with U(VI) and Nd(III) to arrive at the limiting conditions for avoiding third phase formation. (author). 18 refs., 5 figs., 10 tabs.

188 (CEA-CONF–10979) **Diamides as actinides extractants for various wastes treatment.** Cuillerdier, C.; Musikas, C.; Nigond, L. CEA Centre d'Etudes de la Vallee du Rhone, 30 - Marcoule (France). Dept. des Procedes de Retraitement. 1991. 25p. (CONF-911049–: 7. symposium on separation science and technology for energy applications, Knoxville, TN (United States), 20-24 Oct 1991). Order Number DE93721041. Source: OSTI; NTIS (US Sales Only); INIS.

Substituted propanediamides were studied at Fontenay-aux-Roses for the declassification of nuclear liquid wastes by extraction of all the actinides. Their synthesis has been improved. By optimization of the formula, it is possible to use aliphatic diluents without third phase formation in contact with nitric acid at 20 deg C. Addition of oxalic acid allows separation of iron and zirconium from americium and plutonium. In selected conditions, it appears that americium extraction is faster than iron extraction which could lead to practical applications. Recent studies have shown that diamides can be used to remove the actinides from waste solutions in chloride medium coming from defense facilities. The current knowledge and the projects for using diamides as actinides extractants will be reviewed.

189 (CEA-CONF–10982) **Picolinamides, a possible family of actinide extractants, for the one step actinide (VI), (IV) and (III) separation from the spent nuclear fuels dissolution liquors.** Musikas, C.; Cuillerdier, C.; Coutin, C. CEA Centre d'Etudes de la Vallee du Rhone, 30 - Marcoule (France). Dept. des Procedes de Retraitement. 1992. 3p. (CONF-9204201–: 22. Meeting Actinides, Meribel (France), 22-25 Apr 1992). Order Number DE93721044. Source: OSTI; NTIS (US Sales Only); INIS.

The separation of all the actinides U, Np, Pu, Am and Cm from the spent fuels and their further transmutation become one alternative to the deep ground repository storage of radioactive wastes. To achieve this aim, new chemical separation processes, more convenient than the PUREX process, are necessary. Especially, extractants able to separate in one single step the actinide (VI), (IV) and (III) from acidic nitrate solutions, leaving the lanthanides (III) in the effluents are highly suitable. Results in the search of such extractants are presented. 1 tab., 6 refs.

190 (CEA-CONF–10985) **Development and implementation of methods for mass and volume measurements in input solutions.** Cauchetier, P.; Lamarque, G. CEA Centre d'Etudes de la Vallee du Rhone, 30 - Marcoule (France). Dept. des Procedes de Retraitement. 1992. 9p. (CONF-9203198–: Tame Lab Meeting, Ispra (Italy), 25-27 Mar 1992). Order Number DE93721046. Source: OSTI; NTIS (US Sales Only); INIS.

Methods for the determination of the mass of material contained in a vessel, in a nuclear environment, are reviewed. Corrections for temperature and homogeneity are discussed for an accurate determination on an industrial scale.

191 (CEA-CONF–10994) **An example of R and D on safety assessment: study of a prolonged loss of cooling of halw (beyond design accident).** Mercier, J.P. (CEA Centre d'Etudes de Fontenay-aux-Roses, 92 (France). Inst. de Protection et de Surete Nucleaire); Bonneval, F.; Martineau, D.; Gue, J.P.; Philippe, M. CEA Centre d'Etudes de la Vallee du Rhone, 30 - Marcoule (France). Dept. des Procedes de Retraitement. 1991. 25p. (CONF-9110434–: OECD/NEA/CSNI Specialist Meeting on Safety and Risk Assessment in Fuel Cycle Facilities, Tokyo (Japan), 7-9 Oct 1991). Order Number DE93721103. Source: OSTI; NTIS (US Sales Only); INIS.

The consequences of a loss of cooling of storage tanks of fission products concentrated solutions were studied, for a variable period, in the context, of the safety analysis of the COGEMA spent fuel reprocessing plants of La Hague. As a result of fission products-induced heat emission, a prolonger loss of cooling could involve the progressive evaporation of solutions up to dryout and lead to the formation of radioactive aerosols and then of volatile species of ruthenium likely to be released in off gas circuits of the tanks. With the aim of determining the radioactivitiy fraction likely to be transferred throughout the loss of cooling out of the storage tanks, an extensive R and D programme was performed, including the main following stages: - experimental determination of the factor of radioactivity transfer through aerosols out of the tanks; - modelling, by means of a calculation code, of the aerosols transfer into the off gas circuits; - experimental study of the ruthenium behaviour with tests carried out in laboratory, by evaporation of samples representative of nitric solutions of fission products. The main conclusions can be summarized as follows (by assuming a heat power density of 10 watts per litre of solution and a storage system completely adiabatic): - the evaporation of solutions starts more than 5 hours after the total loss of cooling, the 10^{-4} value being an overestimated value of the factor of radioactivity transfer by aerosols out of the tanks; - transfer factor through the off gas circuits varies, according to the physical characterisitcs of aerosols, from 0 to 8.10^{-2}; - ruthenium volatilizes only during the final stage of evaporation, shortly before dryout; the minimum time to reach dryness is about 90 hours.

192 (CEA-CONF–10995) **Fuel reprocessing: safety analysis of extraction cycles.** Dinh, B. (CEA Centre d'Etudes de la Vallee du Rhone, 30 - Marcoule (France). Direction du Cycle du Combustible); Mauborgne, B.; Baron, P.; Mercier, J.P. CEA Centre d'Etudes de la Vallee du Rhone, 30 - Marcoule (France). Dept. des Procedes de Retraitement. 1991. 6p. (CONF-9110434–: OECD/NEA/CSNI Specialist Meeting on Safety and Risk Assessment in Fuel Cycle Facilities, Tokyo (Japan), 7-9 Oct 1991). Order Number DE93721104. Source: OSTI; NTIS (US Sales Only); INIS.

An essential part of the safety analysis related to the extraction cycles of reprocessing plants, is the analysis of their behaviour during steady-state and transient operations, by means of simulation codes. These codes are based on the chemical properties of the main species involved (distribution coefficient and kinetics) and the hydrodynamics inside the contactors (mixer-settlers and pulsed columns). These codes have been consolidated by comparison of calculations with experimental results. The safety analysis is essentially performed in two steps. The first step is a parametric sensivity analysis of the chemical flowsheet operated: the effect of a misadjustment (flowrate of feed, solvent, etc) is evaluated by successive steady-state calculations. These calculations help the identification of the sensitive parameters for the risk of plutonium accumulation, while indicating the permissible level of misadjustment. These calculations also serve to identify the parameters which should be measured during plant operation. The second step is the study of transient regimes, for the most sensitive parameters related to plutonium accumulation risk. The aim is to confirm the conclusions of the first step and to check that the characteristic process parameters chosen effectively allow, the early and reliable detection of any drift towards a plutonium accumulating regime. The procedures to drive the process backwards to a specified convenient steady-state regime from a drifting-state are also verified. The identification of the sensitive parameters, the process status parameters and the process transient analysis, allow a good control of process operation. This procedure, applied to the first purification cycle of COGEMA's UP3-A La Hague plant has demonstrated the total safety of facility operations.

193 (DPW–5360) **[Ion exchange coupling and slag and crucible dissolving]: Trip report to ORNL, April 29, 1952.** Barber, J.R. Du Pont de Nemours (E.I.) and Co., Wilmington, DE (United States). Explosives Dept. 13 May 1952. 2p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-76SR00001. (SR/H–217). Order Number DE93001244. Source: OSTI; NTIS (US Sales Only); GPO Dep.

This report discusses the ion exchange coupling and slag and crucible dissolving. The report is dated April 29, 1952. (JL)

194 (DPW–5373) **U-237 in recovered uranium.** Arnett, L.M. Du Pont de Nemours (E.I.) and Co., Wilmington, DE (United States). Explosives Dept. 14 May 1952. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-76SR00001. (SR/H–219). Order Number DE93001246. Source: OSTI; NTIS (US Sales Only); GPO Dep.

This report discusses the radiation hazard U 237 presents in exposed fuel during uranium recovery from the Purex process. The report is dated May 14, 1952.

195 (DPW–5380) **Project 8980: Savannah River Plant, separations, 200 Area, 221 Bldg., "B" line, waste recovery, dissolving.** Barber, J.R. Du Pont de Nemours (E.I.) and Co., Wilmington, DE (United States). Explosives Dept. 15 May 1952. 2p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-76SR00001. (SR/H–220). Order Number DE93001247. Source: OSTI; NTIS (US Sales Only); GPO Dep.

This memorandum comments on the review of the flow diagram for Pu waste recovery dissolving. The memo is dated May 15, 1952.(JL)

196 (DPW–5690) **Processing of irradiated thorium.** Chambers, F.S. Du Pont de Nemours (E.I.) and Co., Wilmington, DE (United States). Explosives Dept. 23 Jun 1952. 2p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-76SR00001. (SR/H–201). Order Number DE93000662. Source: OSTI; NTIS (US Sales Only); GPO Dep.

This memorandum discusses the processing of irradiated thorium at the Savannah River Plant during June, 1952. The design and development of facilities for processing irradiated thorium are discussed.

197 (DPW–5864) **Trip report: Thorium meeting, Division of Research, AEC, Washington, DC, May 7, 1952.** Hayes, E.E. Du Pont de Nemours (E.I.) and Co., Wilmington, DE (United States). Explosives Dept. 16 Jul 1952. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-76SR00001. (SR/H–209). Order Number DE93001236. Source: OSTI; NTIS (US Sales Only); GPO Dep.

This report discusses the meeting to review the research on thorium during the past year and to formulate the necessary program for the coming year. The report is dated May 7, 1952.

198 (DPW–6618) **A survey of methods for the determination of tritium.** Schloo, M.; VanNess, M. Du Pont de Nemours (E.I.) and Co., Wilmington, DE (United States). Explosives Dept. 14 Nov 1952. 15p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-76SR00001. (SR/H–197). Order Number DE93000658. Source: OSTI; NTIS (US Sales Only); GPO Dep.

During the course of research and development on the Tritium Project there arose two distinct needs for the determination of tritium in other gases: the separation process where helium is the major component; and samples which are essentially hydrogen. This report discusses the analysis of gases to determine the tritium concentration.

199 (EUR–14363, pp. 111-124) **Pilot dismantling of the AT1 FBR reprocessing facility at La Hague. Phase 1 - Dismantling of dissolution and extraction systems and processing of the arising dismantling waste.** Cornu, F. (CEA Centre d'Etudes Nucleaires de Saclay, 91 - Gif-sur-Yvette (France). Direction du Cycle du Combustible). Commission of the European Communities, Luxembourg (Luxembourg). 1992. (CONF-9109441–: 2. Seminar on practical decommissioning experience with nuclear installations in the European Community, Sellafield (United Kingdom), 25-26 Sep 1991). In *Practical decommissioning experience with nuclear installations in the European Community.* 207p. Order Number DE93721081. Source: OSTI; NTIS (US Sales Only); INIS.

AT was designed and built as a pilot plant for the reprocessing of mixed oxide fuel elements coming from the FBR programme. After ten years of operation the plant was definitively shut down in 1979. Due to the different radionuclides involved, fission products and alpha emitters no advantage will come from delaying the dismantling of the facility. The preliminary studies and preparation of the safety report had begun April 1981. Up to 1985 cleaning operations and building improvement took place while specific equipment was developed. Then, dismantling operations really started in 1985. The work planning, revised in 1989, scheduled the completion of the operations for the end of 1992. Considering that the experience to be gained from the dismantling of the first representative nuclear installations in the Community should be made available to all Member States, the Commission selected AT1 as a pilot dismantling project for the 1989-1993 R and D programme on the decommissioning of nuclear installations.

200 (EUR–14363, pp. 125-148) **Decontamination and dismantling of the PIVER prototype vitrification facility at Marcoule: final results and conclusions.** Jouan, A. (CEA Centre d'Etudes de la Vallee du Rhone, 30 - Marcoule (France). Dept. des Procedes de Retraitement); Deschaud, C.; Roudil, S.; Chauvet, F. Commission of the European Communities, Luxembourg (Luxembourg). 1992. (CONF-9109441–: 2. Seminar on practical decommissioning experience with nuclear installations in the European Community, Sellafield (United Kingdom), 25-26 Sep 1991). In *Practical decommissioning experience with nuclear installations in the European Community.* 207p. Order Number DE93721081. Source: OSTI; NTIS (US Sales Only); INIS.

Decommissioning of the PIVER pilot vitrification facility for fission product solutions is now virtually completed. PIVER was targeted for decommissioning in 1984 and the operation began in 1988 after preliminary work from 1984 to 1987. Dismantling of major process equipment, waste removal, cell decontamination, pipe cutting and disassembly of task-related equipment continued until 1990, first

using telemanipulators, with gradually increasing direct human participation as the ambient dose rates dropped to suitable levels. After decontamination of a few residual irradiation sources, the final operations during 1991 involved experimental R and D to assess a number of final decontamination processes.

201 (HW–34253) **Production Test 221-T-19 reduction of time cycle in dissolver section.** Schmidt, W.C. General Electric Co., Richland, WA (United States). Hanford Atomic Products Operation. 19 Nov 1954. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE93001248. Source: OSTI; NTIS (US Sales Only); GPO Dep.

To determine, by test, the feasibility of decreasing the time requirements to prepare the aluminum clad uranium slugs into uranyl nitrate solution suitable for the separation of plutonium from uranium in the extraction step.

202 (HW–50089-Del.) **Chemical Processing Department monthly report, April 1957.** General Electric Co., Richland, WA (United States). Hanford Atomic Products Operation. 22 May 1957. 106p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE93000771. Source: OSTI; NTIS (US Sales Only); GPO Dep.

Two new production records were set during April, for processed U and Pu production. 0.9 tons sheared NRX fuel were dissolved in Redox. Discrepancies in Pu yield are being studied. Alternate methods of recovering Np are being evaluated. The Purex prototype facility will be converted to the anion exchange process. Alternate designs for a Purex miniature service dissolver were reviewed. The Purex HA column will be replaced.

203 (HW–51211-Del.) **Chemical Processing Department monthly report, June 1957.** General Electric Co., Richland, WA (United States). Hanford Atomic Products Operation. 22 Jul 1957. 103p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE93000772. Source: OSTI; NTIS (US Sales Only); GPO Dep.

Purex and Redox plants operated satisfactorily. Pu production exceeded commitments. The continuous calciners in UO_3 plant experienced difficulty, but the monthly commitment was exceeded. Capital costs for conversion of B plant to recover Cs and Ce have increased. For future processing of E metal, several 3-ton batches were dissolved in Redox. The continuous Task I prototype is being tested for startup of production facilities. Redox product solutions generally have higher waste losses than these from Purex material. The continuous anion exchange prototype will also be tested. Engineering studies were completed of two facets of Purex Phase II expansion, plant conversion to two cycles, and expansion to a rate of 25.8 tons U/day. A proposal requests authority to expand Purex to capacity factor 3.2 along with the two-cycle conversion. The Pu trifluoride process review indicated that conversion to the PuF3 process is not likely. Separations plant dissolver capacity potential for the next 5 yr was studied. (DLC)

204 (HW–53449-Del.) **Chemical Processing Department monthly report, October 1957.** General Electric Co., Richland, WA (United States). Hanford Atomic Products Operation. 22 Nov 1957. 106p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE93000773. Source: OSTI; NTIS (US Sales Only); GPO Dep.

Record highs were set for Pu output in separations plants and for amount of U processed in Purex. UO_3 production and shipments exceeded schedules. Fabrication of 200 and 250 Model assemblies is reported. Unfabricated Pu production was 8.5% short. Nitric acid recovery in Purex and Redox is reported. Prototype anion exchange system for Pu was tested in Purex. Hinged agitator arms with shear pin feature was installed in UO_3 plant H calciner. Operation of continuous type Task I, II facility improved. DBBP is considered for Recuplex. Methods for Pu in product solutions agreed to within 0. 10%. Purex recycle dock shelter is complete. Other projects are reported.

205 (HW–59849-Del.) **Chemical Processing Department monthly report, March 1959.** General Electric Co., Richland, WA (United States). Hanford Atomic Products Operation. 20 Apr 1959. 72p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE93001332. Source: OSTI; NTIS (US Sales Only); GPO Dep.

Production of Pu, UO_3, and Pu metal exceeded forecasts. The 2nd attempt at Purex to recover Zr-Nb resulted in about 1/3 recovery, contaminated with about 1% of the Ce. Palm losses to Purex U product were eliminated, and the Pu content was reduced 5 to 10×. Routing the dissolver rinses into 3WB concentrator resulted into improved rinsing efficiency. Unclarified feed was processed through Purex HA column. In a test for using B in Redox, the B was routed completely to the waste; it was not detectable in product streams beyond the first cycle. Almost 1000 g Palm was purified and converted to oxide. Ferrous ion catalyzed the reduction of Palm VI by hydrazine or semicarbazide. Coordination of E-metal and NPR reprocessing at Redox in multipurpose dissolver was studied. An interim fission product recovery program at Purex will be directed toward low-efficiency collection of Pm^{147}. Locations for critical incident alarms were selected. (DLC)

206 (HW–60236-Del.) **Chemical Processing Department monthly report, April 1959.** General Electric Co., Richland, WA (United States). Hanford Atomic Products Operation. 21 May 1959. 68p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE93001225. Source: OSTI; NTIS (US Sales Only); GPO Dep.

Production of Pu from separations plants was only 58% of April commitment because of Purex difficulties. UO_3 production, shipments met schedules. Pu shape production and shipments exceeded forecast by 14%. Purex HS column, repaired Oct 1958, developed another leak and was bypassed April 18, resulting in Pu and U that required reprocessing. A Palm recovery run at Purex with all- reducing flowsheet, resulted in 87% recovery and excellent decontamination of product. The prototype dual-pass silver reactor in Purex C-cell plugged with offgases. Processing of unclarified feed through Purex solvent extraction continued. Redox dissolver batch sizes for E-metal processing were increased from 1.75 to 2.0 tons. Testing of first extraction cycle acidic flowsheet at Redox continued, with Np losses to HAW being below detection limit. Ru in 1AFS stream increased 10-fold F.P. activity but was removed in acid deficient U cycles. A sulfamic acid process is being explored for dissolving Pu metal. Scope design of Redox dissolver and RMA line replacement at Z plant was completed. Shielding effectiveness of medium and high density x-ray lead glass was compared.

207 (HW–60559-Del.) **Chemical Processing Department monthly report, May 1959.** General Electric Co., Richland, WA (United States). Hanford Atomic Products Operation. 21 Jun 1959. 64p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE93001226. Source: OSTI; NTIS (US Sales Only); GPO Dep.

Pu production from separation plants during May was 116% commitments. UO_3 production and shipments met schedules. Button output and shape production was 97 and 121% of schedule/forecast. Recuplex (product recovery) operated at record rates. Processing at Purex was carried out with the HS column bypassed. Palm processing resulted in excellent product quality but with low yield. A sample of fission products was prepared for Curtiss-Wright. Piping modifications were made to the Purex Pu ion exchange units. One Redox feed batch was prepared with dichromate oxidation; the U and Pu streams increased (Ru) as anticipated. Containers and casks were designed for fission product recovery. Design of installation for subassembly of Pit 65 weapon components was begun.

208 (HW–60915-Del.) **Chemical Processing Department monthly report, June 1959.** MacCready, W.K. General Electric Co., Richland, WA (United States). Hanford Atomic Products Operation. 22 Jul 1959. 66p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE93001227. Source: OSTI; NTIS (US Sales Only); GPO Dep.

Production of Pu from separations plants and output of unfabricated Pu exceeded commitments. Purex plant set a new record high for U processed. Production and shipments of UO_3 met schedules. Purex solvent extraction battery performed below normal, probably because of poor solvent quality. NaOH addition to Redox coating removal waste is being reduced. A 3fold improvement in Recuplex product Al impurity was achieved by means of a

specific gravity difference > 0.15 between dilute aqueous feed and extractant. Sintered, high-silica crucibles are being tested in RMA production line in Finished Products Operation. Scope design of a fission product shipping cask was completed; powder temperature should be below 440 F for 1 MCi cerium-144 + impurities. Feasibility of using one outside Purex canyon entrance (stairwell opening) for relief damper opening was tested and found to be insufficient. A drawing of the 6-inch continuous centrifuge being evaluated as a vacuum drum filter on RMA button line was reviewed. Casks were designed for the NPR project. (DLC)

209 (HW–63313-Del.) **Chemical Processing Department monthly report, December 1959.** MacCready, W.K. General Electric Co., Richland, WA (United States). Hanford Atomic Products Operation. 21 Jan 1960. 61p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE93001228. Source: OSTI; NTIS (US Sales Only); GPO Dep.

Production of Pu nitrate from separations plants exceeded commitments. Two Np recovery runs were made, a routine one at Purex and a demonstration run at Redox. Total Np recovered in CY 1959 was 5.7 kg. The UO_3 plant production and shipments also met commitments. Production of unfabricated Pu metal continued. Process studies are being conducted in Purex to resolve the problems in the Np recovery effort. A new solvent (hexone) condensate decanter was operated in Redox. Reprocessing of nonproduction reactor fuels is being reviewed. (DLC)

210 (HW–65165-Del.) **Chemical Processing Department monthly report for May 1960.** General Electric Co., Richland, WA (United States). Hanford Atomic Products Operation. 20 Jun 1960. 50p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE93001783. Source: OSTI; NTIS (US Sales Only); GPO Dep.

Production of Pu nitrate from separations plants during May was below forecast. A Np recovery campaign in Purex yielded 1.5 kg. Production and shipments of UO_3 met schedules. Unfabricated Pu metal production was below forecast, but all shipments were on schedule. Decontamination efficiency was low in Purex solvent extraction around the time of the Np recovery. The damaged Redox B-2 dissolver is being restored; processing of enriched metal in A and C dissolvers was continued. A spectrograph for inclusions in Pu metal was installed. 4 kg Pu oxide was produced in a continuous direct calciner. Scope design on Purex Np recovery and purification facilities was completed. Other design and contracts are discussed.

211 (HW–66271-Del.) **Chemical Processing Department monthly report for July 1960.** General Electric Co., Richland, WA (United States). Hanford Atomic Products Operation. 22 Aug 1960. 54p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE93001784. Source: OSTI; NTIS (US Sales Only); GPO Dep.

Production of Pu nitrate from separations plant during this month was below forecast. UO_3 production, shipments met schedules; so did unfabricated Pu shipments. Purex plant was stopped to replace the final waste concentrator (F-11) (leak). Two Pu-U partition failures were attributed to foreign organic material in the nitric acid; the Pu product was kept within specifications by adding NaF and ANN to ion exchange feed stream. A Np recovery run was started in Redox, and dissolution was started of 12 special 2-ton test batches of normal U fuel elements, irradiated to provide information on Pu formation rates. The damaged B-2 E-metal dissolver was replaced with a conventional dissolver. Test of a new sieve plate cartridge in Recuplex H-1 extraction column was stopped. A new semi-continuous product concentrator-stripper was made to replace Recuplex batch concentrator. Conversion of Purex prototype anion exchange to a manufacturing unit is nearly complete. Design was completed on the new Redox E-metal dissolver. Process feed was introduced into RMC button line and 3 buttons made. Project proposal for NPF reprocessing was revised.

212 (HW–69443) **Chemical Processing Department monthly report, April 1961.** Reinker, P.H. General Electric Co., Richland, WA (United States). Hanford Atomic Products Operation. 22 May 1961. 55p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE93001229. Source: OSTI; NTIS (US Sales Only); GPO Dep.

Pu nitrate production was above revised forecast. 141 kCi Sr-90 was isolated in Purex and stored for decay; to date, 1190 kCi has been recovered from Purex wastes. Casks of Cs-137 and Sr-90 were turned over to AEC for ORNL. Production of UO_3, Pu metal buttons, and weapon component fabrication exceeded forecasts. Purex processing continued until April 14. The Purex neptunium campaign had low yield because of loss to waste system. The cartridge in the Purex co-decontamination column scrub section was replaced with a new design. After the Redox organic distillation pot was replaced, γ activity in Redox recovered hexone increased 300 $\times$; product quality returned to normal after the faulty steam traps were replaced. Fabricated parts underwent dimensional changes after machining and gaging; part dimensions have been altered to compensate. Design for the proposed caisson-lateral leak detection system was revised to contain 3 horizontal laterals beneath each tank and 7 vertical wells around each tank. A ratio exists between the Cs-137 in the coating waste solution and the total U in liquid and precipitate phases. (DLC)

The paper presents the modifications of French transport regulations to take into account the IAEA recommendations and the European conventions for rail and road transport.

214 (CONF-920905–7) **An assessment of the potential impacts on irradiated nuclear fuel transportation operations of applying ICRP Publication 60 recommendations to transport regulations.** Pope, R.B. (Oak Ridge National Lab., TN (United States)); Ratledge, J.E.; Hill, C.V.; Loud, G.C. Oak Ridge National Lab., TN (United States). [1992]. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From 10. international symposium on the packaging and transportation of radioactive materials: PATRAM '92; Yokohama (Japan); 13-18 Sep 1992. Order Number DE92040884. Source: OSTI; NTIS; INIS; GPO Dep.

The International Atomic Energy Agency (LAEA) provides the worldwide basis for regulating the transportation of radioactive materials, the current form of which was issued in 1985 and has since been amended (LKEA 1990). This document [denoted here as "Safety Series No. 6"] serves as regulations for activities controlled or funded by the IAEA and as a model for domestic regulations. This paper focuses on the requirements to provide individual dose limitations. This need to implement limitations on individual dose commitments resulted in the requirements in paragraph 204 of Safety Series No. 6.

215 (CONF-920905–22) **An evaluation of Department of Transportation specification packages.** Ratledge, J.E.; Rawl, R.R. Oak Ridge National Lab., TN (United States). [1992]. 12p. Sponsored by Nuclear Regulatory Commission, Washington, DC (United States). DOE Contract AC05-84OR21400. From 10. international symposium on the packaging and transportation of radioactive materials: PATRAM '92; Yokohama (Japan); 13-18 Sep 1992. Order Number DE92041302. Source: OSTI; NTIS; INIS; GPO Dep.

Specification packages are broad families of package designs developed and authorized by the US Department of Transportation (DOT) and the Nuclear Regulatory Commission (NRC) for transport of certain Type B and fissile radioactive materials, with each specification containing a number of designs of various sizes. The specification package designs have remained essentially unchanged in a changing regulatory environment. Changes to

package designs or authorized contents under the DOT system can be accomplished by rule making action, but there has been little updating of the designs over the years. Many of the individual package designs are no longer supported by reasonably current safety analyses. Since the publication of these specifications, there have been changes in regulatory requirements and improvements in methods of testing and analysis. Additionally, contemplated revisions to the DOT and NRC regulations to bring design requirements into accord with IAEA Safety Series No. 6, 1985 Edition would eliminate fissile classes and require resistance to a crush test for small Type B packages meeting certain criteria. The NRC has requested that the Oak Ridge National Laboratory (ORNL) staff review the safety documentation of the specification packages to determine the possible need for further testing and analysis, modifications to the designs, and, perhaps, elimination of any designs for which there is insufficient demonstration of compliance with current and proposed requirements. This paper will present a summary of the technical data and information concerning the use of the packages that has been received to date.

216 (AECL–6186(rev.5)) **Radioactive waste management in Canada: AECL Research publications and other literature, 1953-1990.** Atomic Energy of Canada Ltd., Chalk River, ON (Canada). Chalk River Nuclear Labs. Nov 1990. 217p. Order Number DE93603990. Source: OSTI; NTIS (US Sales Only); INIS.

This bibliography is a review of the Canadian literature on radioactive waste management from 1953 to the present. It incorporates the references from the previous AECL–6186 revisions, and adds the current data and some of the references that had been omitted. Publications from outside organizations of concern to the Canadian Nuclear Fuel Waste Program are included in addition to AECL Research reports and papers. This report is intended as an aid in the preparation of the Concept Assessment Document and is complementary to AECL Research's internal document-ready references on the MASS-11 word processing systems.

217 (AECL–9566-3(Vol.1,2)) **Underground Research Laboratory room 209 Instrument array. Vol. 1,2: Measured response to excavation.** Lang, P.A.; Kuzyk, G.W.; Babulic, P.J.; Bilinsky, D.M.; Everitt, R.A.; Spinney, M.H.; Kozak, E.T.; Davison, C.C. Atomic Energy of Canada Ltd., Pinawa, MB (Canada). Whiteshell Nuclear Research Establishment. Jun 1991. 280p. Order Number DE93605933. Source: OSTI; NTIS (US Sales Only); INIS.

An in situ excavation response test was conducted at the 240 Level of the Underground Research Laboratory (URL). The test was carried out in conjunction with the drill-and-blast excavation of a near-circular tunnel (Room 209), about 3.5 m in diameter. The tunnel was excavated through a tunnel axis. Three modelling groups made predictions of the response of the rock mass and hydraulic behaviour of the water-bearing fracture to excavation. The tunnel was excavated in two stages, a pilot tunnel followed by a slash, providing two complete sets of response measurements. Careful excavation was carried out to ensure the excavation shape after each blast round agreed closely with the planned shape incorporated in the numerical models. Instrumentation installed before the tunnel was extended monitored the complete strain tensor at eight locations around the tunnel, radial displacements and piezometric pressures at nine locations in the fracture. As well, tunnel convergence, water flows from the fracture, and hydraulic conductivity of the fracture at nine locations, were measured after each excavation step. The final tunnel profiles were accurately surveyed, and the geology was mapped in detail. The results are presented in this report for comparison with the modellers' predictions (reported in AECL–9566-2). Some preliminary conclusions and recommendations regarding the field testing are presented.

218 (AECL–10279) **Assessment of the long-term risks of inadvertent human intrusion into a proposed Canadian nuclear fuel waste disposal vault in deep plutonic rock.** Wuschke, D.M. Atomic Energy of Canada Ltd., Pinawa, MB (Canada). Whiteshell Nuclear Research Establishment; Ontario Hydro, Toronto, ON (Canada). May 1992. 83p. (COG–92-151.). Order Number DE93604001. Source: OSTI; NTIS (US Sales Only); INIS.

This report describes the methodology developed to assess the long-term risk from inadvertent human intrusion into such a facility, and the results of its application to the proposed facility. Four intrusion scenarios were analysed, all initiated by a drilling operation. These scenarios are exposure of a member of the drilling crew, of a technologist conducting a core examination, of a construction worker and of a resident. The consequence of each scenario was estimated using standard computer codes for environmental pathways analysis and radiation dosimetry. For comparison with the risk criterion, an estimate of the probability of each scenario is also required. An event-tree methodology was used to estimate these probabilities. The estimated risks from these intrusion scenarios are several orders of magnitude below the established risk criterion. The event-tree methodology has the advantages of explicitly displaying the assumptions made, of permitting easy testing of the sensitivity of the risk estimates to assumptions, and of combining technical and sociological information.

219 (BNL–47775) **Computer models used to support cleanup decision-making at hazardous and radioactive waste sites.** Moskowitz, P.D.; Pardi, R.; DePhillips, M.P.; Meinhold, A.F. Brookhaven National Lab., Upton, NY (United States). Jul 1992. 102p. Sponsored by USDOE, Washington, DC (United States); Environmental Protection Agency, Washington, DC (United States); Nuclear Regulatory Commission, Washington, DC (United States). DOE Contract AC02-76CH00016. Order Number DE92040575. Source: OSTI; NTIS; INIS; GPO Dep.

Massive efforts are underway to cleanup hazardous and radioactive waste sites located throughout the US To help determine cleanup priorities, computer models are being used to characterize the source, transport, fate and effects of hazardous chemicals and radioactive materials found at these sites. Although, the US Environmental Protection Agency (EPA), the US Department of Energy (DOE), and the US Nuclear Regulatory Commission (NRC) have provided preliminary guidance to promote the use of computer models for remediation purposes, no Agency has produced directed guidance on models that must be used in these efforts. To identify what models are actually being used to support decision-making at hazardous and radioactive waste sites, a project jointly funded by EPA, DOE and NRC was initiated. The purpose of this project was to: (1) Identify models being used for hazardous and radioactive waste site assessment purposes; and (2) describe and classify these models. This report presents the results of this study.

Dept. des Procedes de Retraitement); Leroy, P.; Runge, S. CEA Centre d'Etudes de la Vallee du Rhone, 30 - Marcoule (France). Dept. des Procedes de Retraitement. 1992. 4p. (CONF-920430–: 3. international high level radioactive waste management

(IHLRWM) conference, Las Vegas, NV (United States), 12-16 Apr 1992). Order Number DE93721043. Source: OSTI; NTIS (US Sales Only); INIS.

This extended summary discusses the immobilization of high level wastes from the viewpoint of the quality of the final product, i.e. the HLW glass. The R and D studies comprise 3 steps: glass formulation, glass characterization and long term behaviour studies.

222 (CEA-CONF–11003) **New organic chelating agents for complexation of cations. Application to nuclear waste treatment.** Cuillerdier, C.; Musikas, C.; Nigond, L. CEA Centre d'Etudes de la Vallee du Rhone, 30 - Marcoule (France). Dept. des Procedes de Retraitement. 1992. 3p. (CONF-9209235–: ISECOS 92: International Organic Substances Solvent Extraction Conference, Voronezh (Russian Federation), 22-25 Sep 1992). Order Number DE93721112. Source: OSTI; NTIS (US Sales Only); INIS.

Pentaalkylpropanediamides are powerful extractants for the treatment of both nitric and chloride wastes. They are easily synthesized and purified. Containing no phosphorus atom they can be completely incinerated, creating no secondary wastes. Extraction is optimized by a proper choice of alkyl substituents allowing high extraction efficiency for Am^{3+}, use of aliphatic diluents without third phase formation in contact of concentrated nitric acid, low aqueous solubility, increased iron separation and stability toward hydrolysis and radiolysis.

223 (CEA-CONF–11027) **Management of slightly tritiated wastes and associated tests at the Study Center of Bruyeres le Chatel.** Paillard, P.; Clerc, H. CEA Centre d'Etudes de Bruyeres-le-Chatel, 91 (France). 1991. 12p. (In French). (CONF-910920–: 4. topical meeting on tritium technology in fission, fusion, and isotopic applications, Albuquerque, NM (United States), 29 Sep - 4 oct 1991). Order Number DE93721147. Source: OSTI; NTIS (US Sales Only); INIS.

Daily degassing rate of drums containing wastes with a low tritium content is a required parameter for removal towards a storage site. Methodology and techniques of increasing sensitivity used for this rate measurement are presented. For 200-liter drums, the degassing range is comprised between 0.1 MBq and 1.85 GBq per day. Equipment has been operating for several years allowing the dispatching of 443 drums and also the testing of on-site storage before disposal.

224 (CONF-921029–5) **Implementation of environmental compliance for operating radioactive liquid waste systems at the Oak Ridge National Laboratory.** Hooyman, J.H.; Robinson, S.M. Oak Ridge National Lab., TN (United States). 19 Oct 1992. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From Annual Department of Energy model conference on waste management and environmental restoration; Oak Ridge, TN (United States); 19-22 Oct 1992. Order Number DE93000433. Source: OSTI; NTIS; INIS; GPO Dep.

This paper addresses methods being implemented at the Oak Ridge National Laboratory (ORNL) to continue operating while achieving compliance with new standards for liquid low level waste (LLLW) underground storage tank systems. The Superfund Amendment and Reauthorization Act (SARA) of the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA) required that the Department of Energy (DOE) execute a Federal Facility Agreement (FFA) with the Environmental Protection Agency (EPA) within 6 months of listing of the ORNL on the National Priorities List. An FFA for ORNL became effective January 1, 1992 among the EPA, DOE, and the Tennessee Department of Environment and Conservation (TDEC). The agreement ensures that environmental impacts resulting from operations at the Oak Ridge Reservation are investigated and remediated to protect the public health, welfare, and environment.

225 (DOE/ER–1070-D1) **Field sampling and analysis plan for the remedial investigation of Waste Area Grouping 2 at Oak Ridge National Laboratory, Oak Ridge, Tennessee: Environmental Restoration Program.** Boston, H.L.; Ashwood, T.L.; Borders, D.M.; Chidambariah, V.; Downing, D.J.; Fontaine, T.A.; Ketelle, R.H.; Lee, S.Y.; Miller, D.E.; Moore, G.K.; Suter, G.W.; Tardiff, M.F.; Watts, J.A.; Wickliff, D.S. Oak Ridge National Lab., TN (United States). Feb 1992. 235p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. (ORNL/ER–58-D1). Order Number DE92010909. Source: OSTI; NTIS; INIS; GPO Dep.

Environmental Sciences Division Publication No. 3780.

This field sampling and analysis (S & A) plan has been developed as part of the Department of Energy's (DOE's) remedial investigation (RI) of Waste Area Grouping (WAG) 2 at Oak Ridge National Laboratory (ORNL) located in Oak Ridge, Tennessee. The S & A plan has been written in support of the remedial investigation (RI) plan for WAG 2 (ORNL 1990). WAG 2 consists of White Oak Creek (WOC) and its tributaries downstream of the ORNL main plant area, White Oak Lake (WOL), White Oak Creek embayment (WOCE) on the Clinch River, and the associated floodplain and subsurface environment (Fig. 1.1). The WOC system is the surface drainage for the major ORNL WAGs and has been exposed to a diversity of contaminants from operations and waste disposal activities in the WOC watershed. WAG 2 acts as a conduit through which hydrologic fluxes carry contaminants from upgradient areas to the Clinch River. Water, sediment, soil, and biota in WAG 2 are contaminated and continue to receive contaminants from upgradient WAGs. This document describes the following: an overview of the RI plan, background information for the WAG 2 system, and objectives of the S & A plan; the scope and implementation of the first 2 years of effort of the S & A plan and includes recent information about contaminants of concern, organization of S & A activities, interactions with other programs, and quality assurance specific to the S & A activities; provides details of the field sampling plans for sediment, surface water, groundwater, and biota, respectively; and describes the sample tracking and records management plan.

226 (DOE-HMIP-RR–92.031) **Review of the interactions between bentonite and cement.** Duerden, S.L. Building Research Establishment, Watford (United Kingdom). 1992. 26p. Sponsored by Department of the Environment, London (United Kingdom). Her Majesty's Inspectorate of Pollution. Contract ENP/006/02;M1212. (BRE-CR–5/92.). Order Number DE93605934. Source: OSTI; NTIS (US Sales Only); INIS.

Properties of bentonite may be significantly affected by reaction with cement. This report reviews the literature to identify the reactions that may occur and considers their effects on the performance of bentonite in these applications. The dominant reactions expected under alkaline conditions prevalent in an underground repository where cement is used extensively are zeolitization, beidellitization, and ion exchange. Zeolitisation will occur at high temperatures (200°C) or after long periods (500-1000 years) when the pH is high (pH>9). Beidellitization may occur at high pH (pH>9). The silica may reprecipitate in situ due to low hydraulic conductivity or in regions of low pH or temperature. This may result in reduced porosity/permeability and plasticity. Ion exchange reactions are virtually instantaneous. The rate of the reaction depends on the concentration and rate of access of ground water. Substitution of Ca^{2+} ions from cement for Na^{+} ions in sodium-bentonites will result in reduced swelling pressure and plasticity, and increased hydraulic conductivity of the bentonite. The effect of Na-bentonite on the properties of cement is the formation of an Al-substituted 11A tobermorite, which results in improved Cs^{+} sorption. In cements reacted with Calcium-bentonite the main product was found to be a hydroxyapatite layer on the cement surface. (author).

227 (DOE/NV/10384–13) **Studies of infiltration and lead-soil interactions at the Radioactive Waste Management Site in Area 5 of the Nevada Test Site.** Case, C.M.; Davis, J.O.; Heidker, J.C.; Whitbeck, M.R. USDOE Nevada Operations Office, Las Vegas, NV (United States). Jul 1992. 32p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC08-85NV10384. Order Number DE93002867. Source: OSTI; NTIS; INIS; GPO Dep.

Publication No. 45054.

Several studies were conducted to investigate the possibility of buried lead being transported by water in the unsaturated zone at the Area 5 Radioactive Waste Management Site (RWMS) on the Nevada Test Site. All involved soil from a 37-m soil core collected at the RWMS. The core consisted primarily of sand and small pebbles, with occasional layers of loose rocks. Few buried soil horizons were observed, and the core showed no evidence of a

carbonate layer that would act as a barrier to infiltration. Samples chosen from various depths in the soil core were analyzed chemically. Calcium and sulfate occurred in a prominent layer about 5 m below the surface. The concentration of soluble carbonate increased gradually with depth, while chloride concentrations decreased. Lead concentrations ranged from 1 to 2 mg/kg. Additional data from the soil core were combined with results of earlier field infiltration studies at two sites near the RWMS to estimate flow velocities for water in the unsaturated zone. Under normal (dry) conditions, the degree of saturation is so small that gravity drainage does not occur; water moves by vapor transport and capillary action. Significant water movement occurs only if the soil is at or near saturation. The results suggest that even continuously ponded water at the RWMS would take several months to infiltrate to the water table. Seven samples from the soil core were tested for their ability to adsorb lead. All took up lead with about the same intensity and capacity. Adsorption of lead by insoluble carbonate minerals and precipitation of lead by soluble carbonate in the soil at the RWMS should provide a barrier to lead migration. Finally, measurements were made of the corrosion rates of lead and steel in contact with soil samples from the core. Corrosion rates generally increased with increasing soil saturation at all depths. Under ambient soil conditions at the RWMS, corrosion rates would be low.

228 (DOE/OR–1054-D1) **Phase 2 Sampling Plan for Chestnut Ridge Operable Unit 2 (Filled Coal Ash Pond/Upper McCoy Branch) at the Oak Ridge Y-12 Plant, Oak Ridge, Tennessee: Environmental Restoration Program.** Oak Ridge Y-12 Plant, TN (United States); CDM Federal Programs Corp., Oak Ridge, TN (United States). Aug 1992. 272p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OS21400. (Y/ER–42-D1). Order Number DE92041271. Source: OSTI; NTIS; INIS; GPO Dep.

CDM Federal Programs Corporation (CDM Federal) was contracted by Martin Marietta Energy Systems, Inc. to prepare a Phase H Sampling Plan to describe field investigation work necessary to address regulatory agency review comments on the Remedial Investigation of Filled Coal Ash Pond (FCAP)/Upper McCoy Branch, Chestnut Ridge Operable Unit 2 at the Y-12 Plant, conducted by CH2M Hill in 1990. The scope and approach of the field investigation described in this plan specifically focus on deficiencies noted by the regulators in discussions at the comment resolution meeting of May 8, 1992, in Oak Ridge, Tennessee. This Phase II Sampling Plan includes a field sampling plan, a field and laboratory quality assurance project plan, a health and safety plan, a waste management plan, and appendixes providing an update to applicable or relevant and appropriate requirements for this site and field and laboratory testing methods and procedures. To address deficiencies noted by the regulators, the following activities will be conducted: Background surface soil and surface water/sediment samples will be collected based on statistical considerations for comparison to site data. Existing and new data to be collected will be used to support a human health risk assessment that includes the future homesteader scenario. Biological surveys, samples, and measurements will be collected/conducted to augment existing data and support an ecological risk assessment. Another round of groundwater sampling will be conducted, including on-site wells and the wells on Chestnut Ridge downgradient of the Security Pits. Borings will be completed in the FCAP to collect samples from below the surface depth to describe the chemical characteristics and volume of the ash. The volume of ash associated with sluice channel on Chestnut Ridge will be determined. Soil samples will be corrected below the coal ash in the FCAP and adjacent to sluice channel to evaluate soil contamination and migration of contaminants.

229 (DOE/RL–90-48) **Hanford Site single-shell tank roadmap.** USDOE Richland Field Office, WA (United States). Apr 1991. 251p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE93001475. Source: OSTI; NTIS; INIS; GPO Dep.

The Hanford Site Single-Shell Tank Roadmap covers the near-term waste management activities to ensure safe interim storage of 140 million liters of waste. It also addresses the environmental restoration activities to close the 6 single-shell tank operable units, which include 149 single-shell tanks. These tanks were constructed starting in the 1940's. Sixty-six tanks have leaked or are assumed to be leaking. This Roadmap has highlighted the need for integrated planning and resource allocation. The June 1990 Five-Year Plan did not address the tank safety concerns that evolved since its publication. Potential impacts to Tri-Party Agreement milestones for characterization, stabilization and isolation, technology development/demonstration, and closure will be examined in greater detail to strengthen the technical decision basis and to minimize consequences. The Roadmap indicates the advantage of accelerating characterization programs, technology evaluations, and supplemental environmental impact statement preparation. Working with regulators and expanded public outreach programs are essential to successful completion of this activity.

230 (DOE/RW–0361-SR) **Science, society, and America's nuclear waste: Unit 1, Nuclear waste.** USDOE Office of Civilian Radioactive Waste Management, Washington, DC (United States). [1992]. 29p. Sponsored by USDOE, Washington, DC (United States). Source: OSTI (Free of Charge); INIS.

This publication presents in layman's terms a review of energy and electricity, then discusses in depth nuclear waste, what it is and where it is.

231 (DOE/RW–0369) **Physical system requirements - Accept waste.** USDOE Office of Civilian Radioactive Waste Management, Washington, DC (United States). Aug 1992. 93p. Sponsored by USDOE, Washington, DC (United States). Order Number DE92041118. Source: OSTI; NTIS; INIS; GPO Dep.

The Nuclear Waste Policy Act (NWPA) assigned to the Department of Energy (DOE) the responsibility for managing the disposal of spent nuclear fuel and high-level radioactive waste and established the Office of Civilian Radioactive Waste Management (OCRWM) for that purpose. The Secretary of Energy, in his November 1989 report to Congress (DOE/RW-0247), announced new initiatives for the conduct of the Civilian Radioactive Waste Management (CRWM) program. One of these initiatives was to establish improved management structure and procedures. In response, OCRWM performed a management study and the OCRWM Director subsequently issued the Management Systems improvement Strategy (MSIS) on August 10, 1990, calling for a rigorous implementation of systems engineering principles with a special emphasis on functional analysis. The functional analysis approach establishes a framework for integrating the program management efforts with the technical requirements analysis into a single, unified, and consistent program. This approach recognizes that just as the facilities and equipment comprising the physical waste management system must perform certain functions, so must certain programmatic and management functions be performed within the program in order to successfully bring the physical system into being. Thus, a comprehensive functional analysis effort has been undertaken which is intended to: Identify the functions that must be performed to fulfill the waste disposal mission; Identify the corresponding requirements imposed on each of the functions; and Identify the conceptual architecture that will be used to satisfy the requirements. The principal purpose of this requirements document is to present the results that were obtained from the conduct of a functional analysis effort for the Accept Waste mission.

232 (DOE/RW–0371P) **International nuclear fuel cycle fact book.** USDOE Office of Civilian Radioactive Waste Management, Washington, DC (United States). Sep 1992. 326p. Sponsored by USDOE, Washington, DC (United States). Source: OSTI (Free of Charge); INIS.

The International Nuclear Fuel Cycle Fact Book has been compiled in an effort to provide current data concerning fuel cycle and waste management facilities, R&D programs and key personnel on 23 countries, including the US, four multi-national agencies, and 21 nuclear societies. The Fact Book is organized as follows: National summaries-a section for each country which summarizes nuclear policy, describes organizational relationships, and provides addresses and names of key personnel and information on facilities. International agencies-a section for each of the international agencies which has significant fuel cycle involvement and a listing of nuclear societies. Glossary-a list of abbreviations/acronyms of organizations, facilities, technical and other terms. The national summaries, in addition to the data described above, feature a

small map for each country as well as some general information. The latter presented from the perspective of the Fact Book user in the United States.

233 (EUR–13798) **Dross and ultrafine particulate formation in underwater plasma-arc cutting.** Waldie, B. (Heriot-Watt Univ); Harris, W.K. Commission of the European Communities, Luxembourg (Luxembourg). 1991. 150p. Contract No F11D-0008. Source: OSTI; NTIS (US Sales Only); INIS.

Production rates and detailed chemical and physical characteristics of solid emissions from underwater plasma-arc cutting of non-active 304 grade stainless steel have been studied. Steel thicknesses to 40 mm have been cut in water depths of up to 10 metres. An hyperbaric vessel and a deep water test column and associated experimental equipment and techniques were developed for these studies. Concentrations and compositions of effluent by-product gases were also investigated. Part of the work done has been jointly with CEA Saclay and other institutions. Quantitative data, and possible mechanisms involved in the following aspects of the project were achieved: distribution, particle size and composition of solid emissions; composition and flowrates of effluent gases; effect of depth and other cutting conditions on solid and gaseous emissions; filtration resistance characteristics of water suspended particles; repeatability of cut quality and yields of emissions under standard cutting conditions.

234 (EUR–13985) **Pilot tests on radioactive waste disposal in underground facilities.** Haijtink, B. Commission of the European Communities, Luxembourg (Luxembourg). 1992. 292p. (CONF-9106403–: Workshop on Pilot tests on radioactive waste disposal in underground facilities, Braunschweig (Germany), 19-20 Jun 1991). Source: OSTI; NTIS (US Sales Only); INIS.

The report describes the pilot test carried out in the underground facilities in the Asse salt mine (Germany) and in the Boom clay beneath the nuclear site at Mol (Belgium). These tests include test disposal of simulated vitrified high-level waste (HAW project) and of intermediate level waste and spent HTR fuel elements in the Asse salt mine, as well as an active handling experiment with neutron sources, this last test with a view to direct disposal of spent fuel. Moreover, an in situ test on the performance of a long-term sealing system for galleries in rock salt is described. Regarding the tests in the Boom clay, a combined heating and radiation test, geomechanical and thermo-hydro mechanical tests are dealt with. Moreover, the design of a demonstration test for disposal of high-level waste in clay is presented. Finally the situation concerning site selection and characterization in France and the United Kingdom are described.

235 (EUR–14093) **Fissures and boreholes plugging in fractured geologic deposits (granites).** Boisson, J.Y. (CEA Centre d'Etudes de Fontenay-aux-Roses, 92 (France). Inst. de Protection et de Surete Nucleaire). Commission of the European Communities, Luxembourg (Luxembourg). 1992. 275p. (In French). Contract FI1W/0058F. Source: OSTI; NTIS (US Sales Only); INIS.

This report gives the results of bench-scale experiments and field tests, destined to describe the bentonite behavior in fractured scale models and in boreholes, and to allow to study the rock weathering phenomenons under specific conditions. Dry and compact bentonite, used for exploratory drilling plugging, in crystalline rock deposits and in contact with groundwater, show hydration, swelling and mobility properties with penetration in conducting fractures. The purpose of this work is to define the procedure of clay weathering after the swelling phase, under groundwater circulation effect, to estimate plugs longevity. This study is prepared for the European Atomic Energy Community cost-sharing research program on radioactive waste management and disposal. 63 refs., 100 figs., 30 tabs., 17 plates.

236 (EUR–14097) **Development of test methods for quality control of LLW and MLW in cement or polymers (Parts 1 and 2). Task 3. Characterization of radioactive waste forms. A series of final reports (1985-1989) no. 39.** Angelis, G. de (ENEA, Casaccia (Italy). Centro Ricerche Energia); Marchetti, A.; Balzamo, S. Commission of the European Communities, Luxembourg (Luxembourg). 1992. 126p. Contract FI1W-0101 I. Source: OSTI; NTIS (US Sales Only); INIS.

This report is divided into two parts. In the first part, the qualification of samples arising from the cementation of low (LLW) and intermediate level (MLW) radioactive wastes is studied. In particular, bead ion exchange resins, filter sludges, BWR evaporator concentrates and decontamination solutions have been taken into account. The properties of the final waste forms have been compared with the ones of laboratory scale samples. The qualification of the solidified wastes was performed according to the requirements of the Italian Regulatory Body. Particular attention is devoted to mechanical and thermal properties, biodegradability and behaviour versus water. In the second part, the influence of different parameters on the leaching of Cesium from cemented BWR evaporator concentrates (sulfates) is tested. In particular the influence of the variation of temperature, initial concentration of the tracer, renewal and chemical composition of the leachant, size of the sample, has been tested. 20 refs., 68 figs., 21 tabs.

237 (EUR–14154) **Geomechanical behaviour of boom clay under ambient and elevated temperature conditions.** Neerdael, B. (Centre d'Etude de l'Energie Nucleaire, Mol (Belgium)); Beaufays, R.; Buyens, M.; Bruyn, D. de; Voet, M. Commission of the European Communities, Luxembourg (Luxembourg). 1992. 108p. Contract FI1W-0055. Source: OSTI; NTIS (US Sales Only); INIS.

This research is focused upon in-situ investigations related to the (thermo-) mechanical behaviour of clay. Three main items are covered in this research area: Stress measurements around the underground research facility for radioactive waste disposal using hydraulical stress monitoring stations; detection of micro-fractures in the clay host, mainly using geophysical seismic techniques; long term mechanical behaviour of clay (this last item, studied by ANDRA at Mol, is not described in this paper). The stress monitoring stations appear to be more reliable in getting relative pressure variations with time rather than absolute values of stress, even after studying and improving the characteristics of the surrounding grout. The seismic techniques used to appear to be sensitive and accurate enough for detecting induced fracturation in the clay host, even for the low temperature. This is also in agreement with bench-scale experiments on clay samples intended to quantify the influence of both temperature and consolidation on the velocity. 10 refs., 80 figs., 3 tabs.

238 (EUR–14156) **Modelling of radionuclide migration and heat transport from an High-Level-Radioactive-Waste-repository (HLW) in Boom clay.** Put, M. (Centre d'Etude de l'Energie Nucleaire, Mol (Belgium)); Henrion, P. Commission of the European Communities, Luxembourg (Luxembourg). 1992. 261p. Contract FI1W-0055. Source: OSTI; NTIS (US Sales Only); INIS.

For the modelling of the migration of radionuclides in the Boom clay formation, the analytical code MICOF has been updated with a 3-dimensional analytical solution for discrete sources. the MICOF program is used for the calculation of the release of α and β emitters from the HIGH LEVEL RADIOACTIVE WASTES (HLW). A coherent conceptual model is developed which describes all the major physico-chemical phenomena influencing the migration of radionuclides in the Boom clay. The concept of the diffusion accessible porosity is introduced and included in the MICOF code. Different types of migration experiments are described with their advantages and disadvantages. The thermal impact of the HLW disposal in the stratified Boom clay formation has been evaluated by a finite element simulation of the coupled heat and mass transport equation. The results of the simulations show that under certain conditions thermal convection cells may form, but the convective heat transfer in the clay formation is negligible. 6 refs., 19 figs., 2 tabs., 5 appendices.

239 (EUR–14363, pp. 167-188) **Melting of radioactive scrap. A.- Experience gained by SGR and Siemens with the melting of radioactive scrap. B.- First results obtained with the melting of alpha-contaminated steel scrap.** Sappok, M.; Graebener, K.H. Commission of the European Communities, Luxembourg (Luxembourg). 1992. (CONF-9109441–: 2. Seminar on practical decommissioning experience with nuclear installations in the European Community, Sellafield (United Kingdom), 25-26 Sep

1991). In *Practical decommissioning experience with nuclear installations in the European Community.* 207p. Order Number DE93721081. Source: OSTI; NTIS (US Sales Only); INIS.

The part A deals with the process of melting radioactive scrap in Germany within the framework of research contracts sponsored by European Community from 1984 to 1989. Up to now more than 3500 tons of low-level scrap (< 200 Bq/g) have been melted and recycled. The scrap, has about 95% of Co and Cs 137 activity. In the average the ratio between Co und Cs was 60: 40. Cs quantitatively was found in slag and filter dust, whereas cobalt remained in the ingot. In 1989, a separate and modernized facility was erected. The maximum activity level to be handled is 200 Bq/g. In this new plant 2000 tons have been treated up to now. The part B deals with the results for melting of alpha contaminated steel scrap. Up to now a part of the necessary procurement has been realized for this research program. The delivery of 100 t of material for the melting campaign at SGR has been terminated. The melting approval has been given, the permit for the handling of the radioactive substances for the residual materials due to nuclear fuel concentration has not yet been obtained from the authorities. The test program for the performance of the trials at SGR has been elaborated and must still be coordinated with the authorities. During the first working period in the Siemens laboratories the experimental equipment for the melting of steel scrap was installed and tested. THe main components are the electrical power supply and the inductively heated furnace.

240 (EUR–14363, pp. 189-195) **Conclusions of a study for the large scale melting of radioactive steel scrap arising from the dismantling of nuclear installations.** Cross, M.T. (UKAEA Northern Research Labs. Windscale, Seascale (United Kingdom)). Commission of the European Communities, Luxembourg (Luxembourg). 1992. (CONF-9109441–: 2. Seminar on practical decommissioning experience with nuclear installations in the European Community, Sellafield (United Kingdom), 25-26 Sep 1991). In *Practical decommissioning experience with nuclear installations in the European Community.* 207p. Order Number DE93721081. Source: OSTI; NTIS (US Sales Only); INIS.

This Summary Paper gives an overview of the feasibility assessment carried out by AEA Technology for the evaluation of melting as a waste conditioning method for metallic Low-Level Wastes (LLW). The assessment wa carried out on behalf of BNFL, Nuclear Electric (NE) and the Department of Energy (DEn) in a work programme started in 1987 and completed during 1990. The salient technical findings and economic arguments for the method are presented in this brief appraisal of the study.

241 (EUR–14363, pp. 197-202) **Feasibility testing of the incineration of contaminated graphite in a pilot fluidized bed.** Dubourg, M. (Societe Franco-Americaine de Constructions Atomiques (FRAMATOME), 92 - Courbevoie (France)). Commission of the European Communities, Luxembourg (Luxembourg). 1992. (CONF-9109441–: 2. Seminar on practical decommissioning experience with nuclear installations in the European Community, Sellafield (United Kingdom), 25-26 Sep 1991). In *Practical decommissioning experience with nuclear installations in the European Community.* 207p. Order Number DE93721081. Source: OSTI; NTIS (US Sales Only); INIS.

Level 3 dismantling of G2 et G3 gas-cooled reactors in Marcoule requires the processing of graphite used as neutron moderator. The technique recommended by Framatome involves crushing, milling, and burning the contaminated graphite in an'active' circulating fluidized-bed incinerator installed in the pile chamber of one of the reactors. The use of circulating fluidized-bed techniques for incinerators has been explored by 10 years of research. Several industrial incinerators operating as gas generators have been built to improve the efficiency of low-grade fuels such as slaty or biomass. However the drop in crude oil prices has kept these industrial power generation applications of fluidized-bed incineration from competing effectively on the market. The existence of a pilot facility located at Framatome's development complex in le Creusot and the need to compact combustible low-level waste has renewed interest in this method as a means of processing the waste and reducing the volume of waste packages.

242 (IAEA-TECDOC–652) **Minimization and segregation of radioactive wastes: Technical manual for the management of low and intermediate level wastes generated at small nuclear research centres and by radioisotope users in medicine, research and industry.** International Atomic Energy Agency, Vienna (Austria). Jul 1992. 53p. Order Number DE93603991. Source: OSTI; NTIS (US Sales Only); INIS.

The report will serve as one of a series of technical manuals providing reference material and direct know-how to staff in radioisotope user establishments and research centres in Member States without nuclear power and the associated range of complex waste management operations. Considerations are limited to the minimization and segregation of wastes, these being initial steps on which the efficiency of the whole waste management system depends. The minimization and segregation operations are examined in the context of the restricted quantities and predominantly shorter lived activities of wastes from nuclear research, production and usage of radioisotopes. Liquid and solid wastes only are considered in the report. Gaseous waste minimization and treatment are specialized subjects and are not examined in this document. Gaseous effluent treatment in facilities handling low and intermediate level radioactive materials has been already the subject of a detailed IAEA report. Management of spent sealed sources has specifically been covered in a previous manual. Conditioned sealed sources must be taken into account in segregation arrangements for interim storage and disposal where there are exceptional long lived highly radiotoxic isotopes, particularly radium or americium. These are unlikely ever to be suitable for shallow land burial along with the remaining wastes. 30 refs, 5 figs, 8 tabs.

243 (INFO–0380) **Assessment of computer programs for coupled fluid flow-thermal-mechanical processes in the assessment of deep disposal of radioactive waste.** Acres Consulting Services Ltd., Toronto, ON (Canada); Atomic Energy Control Board, Ottawa, ON (Canada). May 1991. 142p. Project 5.125.1. Order Number DE93604006. Source: OSTI; NTIS (US Sales Only); INIS.

The objective of this project was to review, acquire and install for the AECB one or more computer programs for the analysis of the coupled fluid flow-thermal-mechanical processes that are involved in the deep disposal of high-level nuclear wastes. An assessment of the importance of the various couplings was also to be made. A number of state-of-the-art computer programs were reviewed. None of the programs were capable of modelling all the couplings that are relevant to repository analyses. UDEC, a two-dimensional, discrete-element code which models a rock mass as an assemblage of blocks with fluid flow through the rock joints, was acquired. UDEC also models transient heat flow and thermal stresses. In addition, PLASCON, a finite-element program which simulates two-dimensional thermal elasto-plastic consolidation of porous media, was acquired and installed on Acres VAX 8350 computer. Subsequent to conversion of the programs to a VAX VMS environment and a number of verification runs, analyses were performed at regional, room and canister scales. Although substantial progress was not made in understanding the significance of the couplings, considerable progress was made in understanding the two computer programs and the complexities involved in performing coupled analyses.

244 (INIS-mf–13348, pp. 53-57) **The corrosion kinetics of borosilicate glasses for radioactive waste disposal.** Curti, E. (Paul Scherrer Inst. (PSI), Villigen (Switzerland)). Paul Scherrer Inst. (PSI), Villigen (Switzerland). 1992. 74p. In *Paul Scherrer Institut annual report 1991: Annex IV: PSI nuclear energy research. Progress report 1991.* Order Number DE93000807. Source: OSTI; NTIS; INIS.

Borosilicate glasses will probably be used as immobilization matrix for toxic nuclides in the Swiss repository for high-level radioactive waste. The major threat to the resistance of these glasses is aqueous corrosion, which was found to proceed at rates inversely proportional to the concentration of silic acid in the contacting solution. Conventional glass corrosion models cannot be used to predict the release of radionuclides in the repository environment, since they do not consider the influence of diffusive transport and sorption of silica in the compacted bentonite

surrounding the glass. An alternative model, developed at PSI, provides a tool for estimating these effects. This model predicts an acceptable acceleration of the glass degradation if realistic parameters for silica sorption in bentonite are used. Fully realistic predictions, however, remain unachievable, because other processes regulating the silica concentration in solution (such as the dissolution and precipitation of silicates) cannot be modelled using present knowledge. 245 (KAERI/RR–1014/91) **A study on the treatment of industrial wastewater containing heavy metals.** Yoon, Myung Hwan (Korea Atomic Energy Research Inst., Daeduk (Korea, Republic of)); Chang, In Soon; Choi, Chang Shik; Lee, Yoon Hwan; Hwang, Doo Sung; Shin, Jin Myung; Jung, Young Won; Ko, Yong Sang; Han, Phil Soon. Korea Atomic Energy Research Inst., Daeduk (Korea, Republic of). Jul 1991. 126p. (In Korean). Order Number DE93605924. Source: OSTI; NTIS (US Sales Only); INIS.

The main R.T.=28,29,30 min. components of acornic acid are separated by column chromatography and analyzed by HPLC. According to the precipitation effects of each component of acornic acid in the U.N.H.-U solution, it is considered that the main R.T.=28,29,30 min. components play an important role in the U.N.H.-U precipitation. Meanwhile, as a result of the treatment of the wastewater containing lead, cadmium and mercury, respectively by using acornic acid, the optimum pH for mixing sequence shows pH=10, and it is possible to treat lead and cadmium near upon the effluent limitations by using acornic acid. (Author).

246 (KAERI/RR–1054/91) **Microbial treatment of aqueous wastes.** Lee, Kang Suk (Korea Atomic Energy Research Inst., Daeduk (Korea, Republic of)); Chun, Ki Jung; Kim, Kug Chan; Choi, Yong Ho; Kim, Jin Kyu; Kim, In Gyu; Park, Hyo Koo; Lee, Keun Bae. Korea Atomic Energy Research Inst., Daeduk (Korea, Republic of). Jan 1992. 57p. (In Korean). Order Number DE93605917. Source: OSTI; NTIS (US Sales Only); INIS.

Uranium accumulated extracellularly on the surface of Rhodobacter capsulata and Rhodospirillum rubrum cells. The rate and extent accumulation were subject to environmental parameter such as pH, temperature, carbon source, trace element and interference by certain cations. Uranium accumulation by the cells was rapid and metabolism was not required for uranium uptake by both organism. Cell-bound uranium reached concentration of 22% (Rhodospirillum rubrum) and 24% (Rhdobacter capsulata)of the dry cell weight, but in the cells grown in the presence of inhibitory concentration of $CoCl_2$, cell-bound uranium reached concentration of 27% (Rhodospirillum rubrum) and 29% (Rhodobacter capsulata) of dry cell weight. (Author).

247 (KTM/E-B–101) **JYT - Publicly financed nuclear waste management research programme: Annual report 1990.** Vuori, S. (ed.). Technical Research Centre of Finland, Espoo (Finland). Jul 1991. 119p. Order Number DE93604008. Source: OSTI; NTIS; INIS.

The nuclear waste management research in Finland is funded both by the state and the utilities (represented in cooperation by the Nuclear Waste Commission of the Finnish power companies). A coordinated research programme (JYT) comprising the publicly financed waste management studies was started in 1989 and continues until 1993. The utilities continue to carry out a parallel research programme according to their main financial and operational responsibility for nuclear waste management. The research programme covers the following main topic areas: (1) Bedrock characteristics, groundwater and repository, (2) Release and transport of radionuclides, (3) Performance and safety assessment of repositories, and (4) Waste management technology and costs.

248 (NSS/R–128) **Near-field solubility studies.** Thomason, H.P.; Williams, S.J. AEA Decommissioning and Radwaste, Harwell (United Kingdom); United Kingdom Nirex Ltd., Harwell (United Kingdom). Feb 1992. 46p. (AEA-D and R–0068.). Order Number DE93605943. Source: OSTI; NTIS (US Sales Only); INIS.

Experimental determinations of the solubilities of americium, plutonium, neptunium, protactinium, thorium, radium, lead, tin, palladium and zirconium are reported. These elements have radioactive isotopes of concern in assessments of radioactive waste disposal. All measurements were made under the highly alkaline conditions typical of the near field of a radioactive waste repository which uses cementitious materials for many of the immobilisation matrices, the backfill and the engineered structures. Low redox potentials, typical of those resulting from the corrosion of iron and steel, were simulated for those elements having more than one accessible oxidation state. The dissolved concentrations of the elements were defined using ultrafiltration. In addition, the corrosion of iron and stainless steel was shown to generate low redox potentials in solution and the solubility of iron(II) at high pH was measured and found to be sufficient for it to act as a redox buffer with respect to neptunium and plutonium. (author).

249 (NSS/R–258) **Studies of the effects of organic materials on the sorption of uranium(IV) and thorium(IV) on London clay and Caithness flagstones.** Baston, G.M.N.; Berry, J.A.; Bond, K.A.; Brownsword, M.; Linklater, C.M. AEA Decommissioning and Radwaste, Harwell (United Kingdom); United Kingdom Nirex Ltd., Harwell (United Kingdom). Aug 1991. 30p. (AEA-D and R–0210.). Order Number DE93605944. Source: OSTI; NTIS (US Sales Only); INIS.

The effects of the presence of cellulosic degradation products on the sorption of uranium (IV) and thorium(IV) on London clay and Caithness flagstones have been studied using the batch sorption method. Experimental conditions were chosen to simulate both those expected close to a cementitious repository (pH $\approx$11) and at the edge of the zone of migration of the alkaline plume (pH $\approx$ 8). Work was carried out (i) under baseline conditions, in the absence of organic materials; (ii) with 2×10^{-3}M gluconate, acting as a well-characterised degradation product simulant; (iii) with authentic degradation products. The results show that the presence of authentic degradation products has a small effect on sorption and the presence of gluconate at a high concentration has a marked impact. (author).

250 (NSS/R–260) **Preliminary modelling studies of the migration and sorption of radioelements in the far field of a nuclear waste repository.** Brown, P.L.; Gabriel, D.S.; Haworth, A.; Sharland, S.M.; Smith, A.C.; Tweed, C.J. AEA Decommissioning and Radwaste, Harwell (United Kingdom); United Kingdom Nirex Ltd., Harwell (United Kingdom). Dec 1991. 32p. (AEA-D and R–0123.). Order Number DE93605945. Source: OSTI; NTIS (US Sales Only); INIS.

The development of a model of the migration of dissolved radionuclides through a porous, sorbing material is presented. A surface-complexation model of sorption processes is coupled with a transport simulation using the CHEQMATE code. The chemical model has been shown to reproduce trends observed in batch sorption experiments reasonably well. In this paper, the coupled model is applied to a number of through-diffusion experiments for radioelements, in both the presence and absence of a complexing organic ligand, gluconate (intended to act as a well-characterised simulant of the degradation products arising from cellulosic organic components in the waste). The systems simulated include uranium diffusing through London clay and uranium and plutonium through St Bees sandstone. The simulations of the experiments that include gluconate are compared with observed breakthrough curves. The breakthrough curve for uranium in London clay is in good agreement with the experiment, but for sandstone the agreement is not good. The sandstone model will be refined when more experimental data become available. The model will later be used to investigate possible limitations to the simple K_D approach used in repository safety-assessment modelling. (author).

251 (ORNL/ER–122) **Characterization of secondary solid waste anticipated from the treatment of trench water from Waste Area Grouping 6 at Oak Ridge National Laboratory, Oak Ridge, Tennessee: Environmental Restoration Program.** Kent, T.E.; Taylor, P.A. Oak Ridge National Lab., TN (United States). Environmental Restoration Div. Sep 1992. 31p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE92040848. Source: OSTI; NTIS; INIS; GPO Dep.

This project was undertaken to demonstrate that new liquid waste streams, generated as a consequence of closure activities at Waste Area Grouping (WAG) 6, can be treated adequately by

existing wastewater treatment facilities at Oak Ridge National Laboratory (ORNL) without producing hazardous secondary solid wastes. Previous bench-scale treatable studies indicated that ORNL treatment operations will adequately remove the contaminants although additional study was required in order to characterize the secondary waste materials produced as a result of the treatment A 0.5-L/min pilot plant was designed and constructed to accurately simulate the treatment capabilities of ORNL fill-scale (490 L/min) treatment facilities-the Process Waste Treatment Plant (PWTP) and Nonradiological Wastewater Treatment Plant (NRWTP). This new test system was able to produce secondary wastes in the quantities necessary for US Environmental Protection Agency toxicity characteristic leaching procedure (TCLP) testing. The test system was operated for a 45-d test period with a minimum of problems and downtime. The pilot plant operating data verified that the WAG 6 trench waters can be treated at the PWTP and NRWTP to meet the discharge limits. The results of TCLP testing indicate that none of the secondary solid wastes will be considered hazardous as defined by the Resource Conservation and Recovery Act.

252 (ORNL/RAP/Sub–86-72139/2) **Preliminary geohydrologic site characterization and proposed water quality well locations for WAG 7, WAG 8 and WAG 9.** Baughn, D.C. (MCI/Consulting Engineers, Inc., Knoxville, TN (United States)). Oak Ridge National Lab., TN (United States); MCI/Consulting Engineers, Inc., Knoxville, TN (United States). Sep 1987. 287p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE93000502. Source: OSTI; NTIS; GPO Dep.

The purpose of this report is to assess general site conditions and to recommend water quality well locations at three Waste Area Groupings (WAGS) within the Oak Ridge National Laboratory (ORNL) complex. The subject sites are WAGs 7, 8 and 9 each of which is identified on the general site location map. For reference, the relationship of the subject sites to other WAGs are shown. WAGs are regions prescribed by Martin Marietta throughout the ORNL complex that require environmental assessment. WAGs contain solid waste management units such as Solid Waste Storage Areas (SWSAs), as well as pipelines, spill sites, buildings, ponds and experimental test sites. These solid waste management units are considered to be potential sources of contamination. The WAG boundaries describe the areal limits of specific waste management operations as well as currently known areas of waste constituent migration. Because solid waste management units within WAGs 7, 8 and 9 may continue to release waste constituents to the environment, the existing groundwater monitoring systems is being upgraded. This report recommends locations for water quality wells which will be installed at these three WAG boundaries in order to gather water quality data. The proposed well locations are shown. Water quality well design coordinates (ORNL grid) and estimated completion depths are given.

253 (PNL–8047) **Minutes of the Tank Waste Science Panel meeting, November 11–13, 1991: Hanford Tank Safety Project.** Strachan, D.M. (comp.). Pacific Northwest Lab., Richland, WA (United States). Apr 1992. 317p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (CONF-9111267–: Tank waste science panel, Pasco, WA (United States), 11-13 Nov 1991). Order Number DE93001271. Source: OSTI; NTIS; INIS; GPO Dep.

The sixth meeting of the Tank Waste Science Panel was held November 11–13, 1991, in Pasco and Richland, Washington. Participating scientists presented the results of recent work on various aspects of issues relating to the generation and release of gases from Tank 241-SY-101 and the presence of ferrocyanide in other tanks at Hanford. Results are discussed.

254 (PNL–8048) **Minutes of the Tank Waste Science Panel meeting July 9–1, 1991: Hanford Tank Safety Project.** Strachan, D.M. (comp.). Pacific Northwest Lab., Richland, WA (United States). Apr 1992. 243p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE93001272. Source: OSTI; NTIS; INIS; GPO Dep.

The fifth meeting of the Tank Waste Science Panel was held July 9–11, 1991, in Atlanta, Georgia. The subject areas included the generation, retention, and release of gases from Tank 241-SY-101 and the chemistry of ferrocyanide wastes.

255 (PNL–8338) **Hydrogen Safety Project: Chemical analysis support task: Window "E" analyses.** Jones, T.E.; Campbell, J.A.; Hoppe, E.W.; Greenwood, L.R.; Gillespie, B.M. Pacific Northwest Lab., Richland, WA (United States). Sep 1992. 986p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE93001658. Source: OSTI; NTIS; INIS; GPO Dep.

Core samples taken from tank 101-SY at Hanford during "window E" were analyzed for organic and radiochemical constituents by staff of the Analytical Chemistry Laboratory at Pacific Northwest Laboratory. Westinghouse Hanford company submitted these samples to the laboratory.

256 (PNL-SA–20520) **Second-order model selection in mixture experiments.** Redgate, P.E.; Piepel, G.F.; Hrma, P.R. Pacific Northwest Lab., Richland, WA (United States). Jul 1992. 20p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (CONF-920893–5: Joint statistical meetings of the American Statistical Association, the Biometric Society and the Institute of Mathematical Statistics, Boston, MA (United States), 9-13 Aug 1992). Order Number DE92041334. Source: OSTI; NTIS; GPO Dep.

Full second-order models for q-component mixture experiments contain q(q+l)/2 terms, which increases rapidly as q increases. Fitting full second-order models for larger q may involve problems with ill-conditioning and overfitting. These problems can be remedied by transforming the mixture components and/or fitting reduced forms of the full second-order mixture model. Various component transformation and model reduction approaches are discussed. Data from a 10-component nuclear waste glass study are used to illustrate ill-conditioning and overfitting problems that can be encountered when fitting a full second-order mixture model. Component transformation, model term selection, and model evaluation/validation techniques are discussed and illustrated for the waste glass example.

257 (PNL-SA–20941) **Pretreatment process testing of Hanford tank waste for the US Department of Energy's Underground Storage Tank Integrated Demonstration.** Jones, E.O. (Pacific Northwest Lab., Richland, WA (United States)); Colton, N.G.; Bloom, G.R.; Barney, G.S.; Colby, S.A.; Cowan, R.G. Pacific Northwest Lab., Richland, WA (United States). Apr 1992. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (CONF-920851–75: Spectrum '92: nuclear and hazardous waste management international topical meeting, Boise, ID (United States), 23-27 Aug 1992). Order Number DE92041328. Source: OSTI; NTIS; INIS; GPO Dep.

Work conducted for the Underground Storage Tank Integrated Demonstration supports technology demonstration for tank remediation operations at the US Department of Energy's (DOE) Hanford Site and other DOE sites. Several technical areas within the demonstration are being investigated by the Waste Pretreatment Technology Development task to support final treatment and disposal of Hanford tank waste. The experimental work includes waste characterizations; dissolution, leaching and extraction tests; bulk salt separations by freeze crystallization; and radiochemical separations with extraction chromatography resins. Chemical species and particle size data provide background information for interpreting waste leaching and dissolution data. Tie major crystalline phases in one single-shell tank (SST) waste are sodium nitrate and bismuth phosphate, while the major phases in another SST waste are boehmite, gibbsite, and sodium nitrate. A scanning electron microscopy (SEM) method of particle size analysis shows that many of the sub-micron particles in the two SST wastes appear to be aggregates of smaller, spheroidal particles. In turn, leaching, dissolution, and extraction studies, performed with tank wastes, provide fundamental information needed to evaluate existing pretreatment technologies. Preliminary results from the dissolution of one SST waste indicate that 2M nitric acid may effectively leach enough transuranic material that the sludge could be disposed of as low level waste.

258 (PNL-SA-21009) **Radioactive waste vitrification technology.** Burkholder, H.C.; Chapman, C.C.; Ross, W.A.; Thompson, L.E. Pacific Northwest Lab., Richland, WA (United States). Sep 1992. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (CONF-9209108-2: 3. annual meeting of USSR Nuclear Society, St. Petersburg (Russian Federation), 14-18 Sep 1992). Order Number DE93001516. Source: OSTI; NTIS; INIS; GPO Dep.

This report discusses the involvement of the Pacific Northwest Laboratory in the development of vitrification technology for the treating of radioactive, chemical and mixed wastes since the 1960's.

259 (PNL-SA-21233) **Resolution of safety issues associated with the storage of high-level radioactive waste at the Hanford Site.** Mellinger, G.B. (Pacific Northwest Lab., Richland, WA (United States)); Tseng, J.C. Pacific Northwest Lab., Richland, WA (United States). Aug 1992. 23p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (CONF-920808-10: American Institute of Chemical Engineers (AIChE) summer national meeting, Minneapolis, MN (United States), 9-12 Aug 1992). Order Number DE92041332. Source: OSTI; NTIS; INIS; GPO Dep.

A number of high-level radioactive waste (HLW) safety issues have been identified at the Hanford Site in southeastern Washington State. Resolution of these issues is one of the Highest Priorities of the US Department of Energy. The most urgent issues are the potential for explosions in certain tanks (due to periodic venting of large quantities of flammable gases, or the presence of substantial quantities of ferrocyanide and/or organic compounds in combination with nitrates-nitrites). Other safety issues have been identified as well, such as the requirement for periodic water additions to one tank to control its temperature and the release of noxious vapors from a number of tanks. Substantial progress has been made toward safety issue resolution. Potential mechanisms have been identified for the generation, retention and periodic venting of flammable gas mixtures; potential methods for controlling the periodic release behavior have been identified and in-tank testing will be initiated in 1992. Research is being conducted to determine the initiation temperatures, energetics, reaction sequences and effects of catalysts and initiators on ferrocyanide-nitrate/nitrite reactions; waste characterization on a tank-by-tank basis will be required to identify whether ferrocyanide-containing wastes are safe to store as-is or will require further treatment to eliminate safety concerns. Resolution of all of the Hanford Site HLW safety issues will be accomplished as an integral part of the Hanford Tank Waste Remediation System, that has been established to manage the storage of these wastes and their preparation for disposal.

260 (RFP-4485) **Liquefaction and storage of thermal treatment off-gases.** Stull, D.M. (EG and G Rocky Flats, Inc., Golden, CO (United States). Rocky Flats Plant); Golden, J.O. EG and G Rocky Flats, Inc., Golden, CO (United States). Rocky Flats Plant. 8 Sep 1992. 24p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC34-90DP62349. Order Number DE93001883. Source: OSTI; NTIS; GPO Dep.

A fluidized bed catalytic oxidation unit is being developed for use in the destruction of mixed waste at the Rocky Flats Plant. Cyclones, filters, in situ neutralization of acid gases, and a catalytic converter are used to meet emission standards. Because there is concern by the public that these measures may not be adequate, two off-gas capture systems were evaluated. Both systems involve liquefaction of carbon dioxide produced in the oxidation process. The carbon dioxide would be released only after analysis proved that all appropriate emission standards are met.

261 (SAND-91-2416) **LLUVIA-II: A program for two-dimensional, transient flow through partially saturated porous media: Yucca Mountain Site Characterization Project.** Eaton, R.R.; Hopkins, P.L. Sandia National Labs., Albuquerque, NM (United States). Aug 1992. 53p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. Order Number DE93001349. Source: OSTI; NTIS; INIS; GPO Dep.

LLUVIA-II is a program designed for the efficient solution of two-dimensional transient flow of liquid water through partially saturated, porous media. The code solves Richards equation using the method-of-lines procedure. This document describes the solution procedure employed, input data structure, output, and code verification.

262 (SAND-91-7071) **Consolidation of the Waste Isolation Pilot Plant crushed salt/bentonite mixtures as a function of confining pressure and moisture content as compared with constitutive model predictions.** Brodsky, N.S. (RE/SPEC, Inc., Rapid City, SD (United States)); Pfeifle, T.W. Sandia National Labs., Albuquerque, NM (United States); RE/SPEC, Inc., Rapid City, SD (United States). Jul 1992. 63p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. Order Number DE93001801. Source: OSTI; NTIS; INIS; GPO Dep.

Four hydrostatic consolidation tests were performed on crushed salt/bentonite mixtures to evaluate the influence of moisture on consolidation rate, permeability, and compressive strength. Specimens comprised 30 percent bentonite and 70 percent salt based on total dry weight. Brine was added to each specimen to adjust its total moisture content to between 3.5 and 10 percent (nominal) of the total dry weight. In the consolidation tests, each specimen was subjected to two stages of hydrostatic stress: 0.5 MPa and 3.45 MPa. During each stage, the pressure was maintained at a constant level and volumetric strain data were continuously logged. By using multiple stages, consolidation data were obtained at two pressures and the time required to consolidate the specimens to full saturation was reduced. Once full saturation was achieved, specimens were subjected to a final test stage in which the hydrostatic stress was reduced and a permeability test was performed. A steady flow permeability test was performed successfully on only one specimen and its permeability was determined to be 1.12×10^{-19} m^2. An unconfined compressive strength test was conducted on one of the consolidated specimens and was found to be 1.66 MPa. A density model proposed by Sjaardema and Krieg was compared to the dry density data using parameter values established by Callahan and DeVries. The model fit the data best at intermediate moisture contents and low pressures. The model was also fitted to the data obtained in this study to determine additional parameter values.

263 (SAND-91-7099) **Waste Isolation Pilot Plant: Alcove Gas Barrier trade-off study.** Lin, M.S. (Parsons, Brinckerhoff, Quade and Douglas, Inc., San Francisco, CA (United States)); Van Sambeek, L.L. Sandia National Labs., Albuquerque, NM (United States); Parsons, Brinckerhoff, Quade and Douglas, Inc., San Francisco, CA (United States); RE/SPEC, Inc., Rapid City, SD (United States). Jul 1992. 231p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. Order Number DE93001802. Source: OSTI; NTIS; INIS; GPO Dep.

A modified Kepner-Tregoe method was used for a trade-off study of Alcove Gas Barrier (AGB) concepts for the Waste Isolation Pilot Plant. The AGB is a gas-constraining seal to be constructed in an alcove entrance drift. In this trade-off study, evaluation criteria were first selected. Then these criteria were classified as to their importance to the task, assigning a weighting value to each aspect. Eleven conceptual design alternatives were developed based on geometrical/geological considerations, construction materials, constructibility, and other relevant factors and evaluated.

264 (SAND-92-0685C) **Overview of waste component recycle, treatment, and disposal integrated demonstration (WeDID) activities.** Wheelis, W.T. Sandia National Labs., Albuquerque, NM (United States). [1992]. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. (CONF-921090-1: International symposium on energetic materials technology: demilitarization, New Orleans, LA (United States), 4-7 Oct 1992). Order Number DE92040268. Source: OSTI; NTIS; INIS; GPO Dep.

Over the last year it has become apparent that there will be a reduction of nuclear weapon stockpiles in both the United States (US) as well as the Commonwealth of Independent States (CIS; formerly the Soviet Union). To meet these requirements in the United States will necessitate the dismantlement and safe disposal, in accordance with Environmental Protection Agency (EPA) guidelines, of a wide variety of types of components (representing more than 30 years of hardware development). The primary regulatory driver for these components is the Resource Conservation and Recovery Act (RCRA). Weapon components contain hazardous materials (e.g.,

heavy metals), PCBs, self-contained explosives, radioactive materials, gas-filled tubes, etc. Because of the wide range of materials found in these components, processes that are technologically robust (i.e., can handle the wide variation of weapon component materials), are cost-effective, recycle as much material as possible, provide true waste minimization, and are fully regulatory compliant are needed. The Waste Component Recycle, Treatment, and Disposal Integrated Demonstration (WeDID) is examining issues in these areas and demonstrating technologies that can be used for the safe disposal of the non-nuclear components of a nuclear weapon. The methods and technologies developed by WeDID for US weapon components would be directly applicable to CIS components. WeDID is a Department of Energy (DOE), Environmental Restoration and Waste Management (ERWM) sponsored program. The goal of WeDID is, to demonstrate the end-to-end disposal process for Sandia National Laboratory designed weapon components. It is anticipated that WeDID can demonstrate true waste minimization by recycling at least 30% (by total component weight) of the metals found in these components, and destruction of at least 30% of the organic materials typically found in a weapon component.

265 (SAND–92-1275) **Thermal diffusion processes in aqueous sodium chloride solutions.** Cygan, R.T. (Sandia National Labs., Albuquerque, NM (United States)); Jarrell, G.D. Sandia National Labs., Albuquerque, NM (United States). 18 Aug 1992. 36p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. Order Number DE93002596. Source: OSTI; NTIS; INIS; GPO Dep.

The experimental results for the Soret coefficients are variable, but suggest a trend with NaCl concentration that is consistent with electrolyte solution behavior. The temperature dependence of the Soret coefficients is in approximate agreement with previous measurements obtained using other techniques. In general, the Soret coefficient values are best interpreted based on the expansion of the fluid inclusion migration fields. The high temperature values for σ at 1.0 N NaCl concentration suggest an expansion of the migration field to smaller inclusion sizes, which for a single halite crystal at these conditions, approach a dimension of one micron. The corresponding fluid inclusion size for the polycrystalline material, where grain boundaries retard the migration, is approximately 10 microns. Although the Soret results obtained in the present study provide additional data for high temperature applications in nuclear waste isolation, more experimentation and new equipment design are required in order to obtain data at temperatures above 80°C. The experimental approach utilized in this study is limited in that respect. The almost immeasurable nature of the thermal diffusion process for the brines as examined in the laboratory, suggests that this effect will be insignificant (outside of fluid inclusion migration) in most rock-water interactions associated with a rocksalt nuclear waste repository. Other effects, such as convective fluid transport, pressure solution, and groundwater flow, will be orders-of-magnitude more important in evaluating the critical nature of brine migration, waste canister corrosion, and the potential for leaching radioisotopes from waste repositories.

266 (SKB-TR–91-64) **SKB annual report 1991. Including summaries of technical reports issued during 1991.** Swedish Nuclear Fuel and Waste Management Co., Stockholm (Sweden). May 1992. 195p. Order Number DE93604009. Source: OSTI; NTIS; INIS.

This is the annual report on the activities of the Swedish Nuclear Fuel and Waste Management Co., SKB. SKB is the owner of CLAB, the central facility for interim storage of spent nuclear fuel, located at Oskarshamn. CLAB was taken into operation in July 1985 and to the end of 1991 in total 1514 tonnes of spent fuel (measured as uranium) have been received. Transportation from the nuclear sites to CLAB is made by a special ship, M/S Sigyn. At Forsmark the final repository for Radioactive Waste (SFR) was taken into operation in April 1988. The repository is situated in crystalline rock under the Baltic Sea. The first construction phase includes rock caverns for 60000 m^3 of waste. A second phase for additional 30000 m^3 is planned to be built and commissioned around the year 2000. At the end of 1991 a total of 7900 m^3 of waste have been deposited in SFR. SKB is in charge of a comprehensive research and development programme on geological disposal of nuclear waste. The total cost for R and D during 1991 was 182.7 MSEK of which 15.9 MSEK came from participants outside Sweden. Geological site-investigations are a substantial part of the programme. SKB is also the managing participant of the international Stripa-project under OECD/NEA. Cost calculations for the total nuclear waste management system, including decommissioning of all reactors, are updated annually. The total cost is estimated to 55 billion SEK. SKB also handles matters pertaining to prospecting and enrichment as well as stockpiling of uranium as strategic reserves for the Swedish nuclear power industry. Consulting service from SKB and associated expert groups are available on a commercial basis. Information activities are an integrated and important part of the Swedish radioactive waste management system. During 1991 successful public information activities have been carried out using mobile exhibitions in a tailor-made trailer and on the SKB ship M/S Sigyn. (au).

267 (SKB-TR–92-03) **Numerical groundwater flow calculations at the Finnsjoen study site - extended regional area.** Lindbom, B. (Kemakta Consultants Co., Stockholm (Sweden)); Boghammar, A. Swedish Nuclear Fuel and Waste Management Co., Stockholm (Sweden). May 1992. 66p. Order Number DE93604010. Source: OSTI; NTIS; INIS.

The present report describes modelling efforts of the groundwater flow situation at the Finnsjoen site in northern Uppland, approximately 140 km north of Stockholm. The study forms part of the SKB 91 performance assessment project, and aims at describing the travel times and travel paths from a potential repository for spent nuclear fuel located in crystalline rock, and also to calculate the flux values at repository level. The groundwater flow equations were solved with the finite element technique and made use of the NAMMU-code for stationary calculations in three dimensions. The calculations aimed at identifying a reference case from which the boundary pressures were to be extracted and used as input for future calculations with the HYDRASTAR-code, which is based on the stochastic continuum approach. The study also comprises an analysis to investigate the model sensitivity to the conductivity contrast between rock mass and fracture zones, the sensitivity to the presence of sub-horizontal fracture zones, and the degree of establishment of the discharge area. The fracture zones were modelled implicitly with an averaging technique. (8 refs., 58 figs.) (au).

268 (SKN–56) **International development within the spent nuclear fuel cycle.** Aggeryd, I. (Studsvik Nuclear, Nykoeping (Sweden)); Broden, K. National Board for Spent Nuclear Fuel, Stockholm (Sweden); Studsvik Nuclear, Nykoeping (Sweden). Mar 1992. 78p. (In Swedish). (STUDSVIK-NW–91-70.). Order Number DE93603992. Source: OSTI; NTIS; INIS.

The report gives a survey of the nerest international development. The waste management, final disposal and waste minimization are discussed more in details. (148 refs.).

269 (SKN–60) **Survey of siting practices for selected management projects in seven countries.** Hardin, E. (Swedish Engineering Services (SINTAB), Bromma (Sweden)); Aahagen, H. National Board for Spent Nuclear Fuel, Stockholm (Sweden). Jun 1992. 110p. Order Number DE93604011. Source: OSTI; NTIS; INIS.

This paper surveys siting practices for deep geologic disposal in seven countries, and attempts to formulate generalizations which could be useful for the upcoming review of the Swedish plan for siting the SFL repository (R and D 92). Comparison of projects in different countries is done with full appreciation of the technical, legal, and cultural differences. The seven countries were selected for experience with siting in crystalline rock, similarity of siting practices to Sweden, and the availability of published information. Local governments have demonstrated effective veto power in each of the seven countries surveyed, although this power is exercised in different ways. This paper shows how the siting strategy itself affects the ability and the inclination of localities to block the project. It shows by example that public involvement, parallel vs. sequential characterization, schedule for siting activities, and the existence of interim waste storage capability have an impact on the success of siting. The focus of this paper is deep geologic disposal. Shallow land disposal and non-radioactive wastes are not discussed in detail, with three exceptions: LLW disposal siting in the U.S. and

Canada, and the SAKAB incinerator projects in Sweden. These provide insight into siting approaches and demonstrate that conclusions regarding deep geologic disposal are supported by other experience. (114 refs.) (au).

270 (SKN–61) **SKNs continued review of predictions and validations in connection with the Aespoe hard rock laboratory.** Palmqvist, K. (Berggeologiska Undersoekningar AB (BERGAB) (Sweden)); Hargelius, H.; Sundquist, U. National Board for Spent Nuclear Fuel, Stockholm (Sweden). Jun 1992. 244p. (In Swedish). Order Number DE93604012. Source: OSTI; NTIS; INIS.

Presents a review of the prediction and validation work the Swedish Nuclear Fuel and Waste Management Company (SKB) has done concerning the Aespoe hard rock laboratory. (39 refs.).

271 (SKN–65) **Comments on the SKB research and development work since 1984 - an overview.** Andersson, Kjell (KARINTA-KONSULT (Sweden)). National Board for Spent Nuclear Fuel, Stockholm (Sweden). Jun 1992. 125p. (In Swedish). Order Number DE93604013. Source: OSTI; NTIS; INIS.

Presents comments on the Swedish research and development programs concerning the management and disposal of high-level radioactive wastes. The comments are given by institutions and authorities.

272 (UCRL-ID–111665) **Study of plutonium volatility under microwave melting conditions used for glass encapsulation of plutonium sludge wastes: An interim report.** Krikorian, O.H.; Condit, R.H.; Fontes, A.F.; Morris, W.F.; Magana, J.W. Lawrence Livermore National Lab., CA (United States). 25 Sep 1992. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE93001827. Source: OSTI; NTIS (US Sales Only); GPO Dep.

Experimental studies have just gotten underway to estimate the extent of Pu volatility occurring during the microwave melting process for glass encapsulation of plutonium sludge wastes. Two tests were conducted for melt temperatures of 1338 and 1435 K.and gave Pu volatilities of 1.3×10^{-10} and 2.1×10^{-10} atm, respectively.

273 (WHC-EP–0474-5) **Quarterly report on Defense Nuclear Facilities Safety Board Recommendation 90-7 for the period ending June 30, 1992.** Cash, R.J.; Dukelow, G.T. Westinghouse Hanford Co., Richland, WA (United States). Jul 1992. 130p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE92040797. Source: OSTI; NTIS; GPO Dep.

This is the fifth quarterly report on the prgress of activities addressing safety issues associated with Hanford Site high-level radioactive waste tanks that contain ferrocyanide compounds.

274 (WHC-EP–0524) **Waste Tank Safety and Operations Program management plan.** Mares, E.F. Westinghouse Hanford Co., Richland, WA (United States). Jan 1992. 553p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE92040479. Source: OSTI; NTIS; INIS; GPO Dep.

This document establishes the Waste Tank Safety and Operations Program; the basis for the program; the procedures for managing the work and the policies to be followed when changing the scope of work. It presents the fiscal year 1992 scope of work, schedule, and cost baselines in the form of a Revised Fiscal Year 1992 Work Plan which is a requirement of the Site Management System. Likewise, it establishes the program objectives, quality assurance requirements, defines internal and external program interfaces; establishes the program management procedures; defines the change control policy; and presents the milestones to be accomplished.

275 (WINCO–11876) **Remote ignitability analysis of high level radioactive wastes.** Lundholm, C.W.; Morgan, J.M.; Shurtliff, R.M.; Trejo, L.E. Westinghouse Idaho Nuclear Co., Inc., Idaho Falls, ID (United States). [1992]. 25p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-84ID12435. (CONF-9210110–1: 33. Oak Ridge National Laboratory/Department of Energy conference on analytical chemistry in energy technology, Gatlinburg, TN (United States), 6-8 Oct 1992). Order Number DE92041323. Source: OSTI; NTIS; INIS; GPO Dep.

The Remote Analytical Laboratory (RAL) at the Idaho National Engineering Laboratory (INEL) is involved in selected regulatory RCRA analyses of high level radioactive wastes. The requirement for characterization of the wastes at the INEL dictated the need for a remote ignitability determination. An ERDCO Model RT-1 Ignitability Tester was extensively modified for remote analysis in the RAL Hot Cell which uses Master Slave manipulators for sample handling and instrument operation. The modifications to the ERDCO instrument were required because of observation problems and remote sample/instrument handling in the hot cell. Highlights of the modifications for remote operation are as follows: a piezo film sensor was added for flash/nonflash detection, a mass flow controller and a thermocouple flame detector were added to ensure flame consistency and ignition, and a small stepper motor was used to activate the shutter. Design features of the remote ignitability instrument and remote sampling techniques are discussed.

276 (WSRC-MS–92-324) **Factors affecting the rate of hydrolysis of phenylboronic acid in lab-scale precipitate reactor studies.** Bannochie, C.J.; Marek, J.C.; Eibling, R.E.; Baich, M.A. Westinghouse Savannah River Co., Aiken, SC (United States). [1992]. 26p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. (CONF-9209226–1: Emerging technologies in hazardous waste management, Atlanta, GA (United States), 21-23 Sep 1992). Order Number DE93000472. Source: OSTI; NTIS; INIS; GPO Dep.

Removing aromatic carbon from an aqueous slurry of cesium-137 and other alkali tetraphenylborates by acid hydrolysis will be an important step in preparing high-level radioactive waste for vitrification at the Savannah River Site's Defense Waste Processing Facility (DWPF). Kinetic data obtained in bench-scale precipitate hydrolysis reactors suggest changes in operating parameters to improve product quality in the future plant-scale radioactive operation. The rate-determining step is the removal of the fourth phenyl group, i.e. hydrolysis of phenylboronic acid. Efforts to maximize this rate have established the importance of several factors in the system, including the ratio of copper(II) catalyst to formic acid, the presence of nitrite ion, reactions of diphenylmercury, and the purge gas employed in the system.

277 (WSRC-RP–89-898-Vol.1) **Waste management units - Savannah River Site: Volume 1, Waste management unit worksheets.** Westinghouse Savannah River Co., Aiken, SC (United States). Oct 1989. 295p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. Order Number DE92040052. Source: OSTI; NTIS; INIS; GPO Dep.

This report is a compilation of worksheets from the waste management units of Savannah River Plant. Information is presented on the following: Solid Waste Management Units having received hazardous waste or hazardous constituents with a known release to the environment; Solid Waste Management Units having received hazardous waste or hazardous constituents with no known release to the environment; Solid Waste Management Units having received no hazardous waste or hazardous constituents; Waste Management Units having received source; and special nuclear, or byproduct material only.

278 (WSRC-RP–90-1055-Rev.1) **Task plan for test of PRBT prototypic liquid sampler: Revision 1.** Jenkins, W.J. Westinghouse Savannah River Co., Aiken, SC (United States). 3 Feb 1992. 32p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. Order Number DE93001358. Source: OSTI; NTIS; INIS; GPO Dep.

The primary objective of this task is to determine just how representative Precipitate Reactor Bottom Tank (PRBT) samples taken from the Hydragard™ prototypic liquid sampler are of the in-tank contents and also to determine the homogeneity of the in-tank contents. This shall be accomplished by a statistical design study sampling plan for paired contrasts of the analysis results of samples taken from: (1) the Hydragard™ prototypic liquid sampler paired with the more fundamental grab sampler at the lower elevation for the Hydragard™ prototypic liquid sampler accuracy and (2) the grab sampler at the lower elevation paired with the grab sampler at the upper elevation for the in-tank homogeneity. These

measurements are paired together to sharpen the contrast so that, as nearly as possible, only the conditions of the effect under study will differ between the two. This "split-plot" arrangement provides increased precision for the contrast under study by canceling out common extraneous effects, thereby enabling the detection of smaller effects. The secondary objective of the task is to determine the level of influence of the major contributors to the overall uncertainty in the sample preparation and measurement process. These major steps include: preparation method (H_2SO_4-HF Titanium dissolution); aliquoting and dilution within a dissolution; measurement and long-term behavior of the ICP and AA instruments, as monitored by the measurement of standards and blanks embedded within each block of samples for the measurement sequence. This sampling task, therefore, is mostly devoted to determining the sampler characteristics and is not intended to provide a comprehensive estimate of the overall uncertainty affecting DWPF sample analysis in routine operation.

279 (WSRC-TR–91-648) **Estimates of DWPF canister production.** Plodinec, M.J. Westinghouse Savannah River Co., Aiken, SC (United States). 6 Dec 1991. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. Order Number DE92040818. Source: OSTI; NTIS; INIS; GPO Dep.

Specification 1.2 of the repository program's Waste Acceptance Preliminary Specifications requires that the DWPF estimate the radionuclide inventory, and provide the error of the estimate, for each waste type (assumed to be each sludge batch). The inventory of any radionuclide is directly proportional to the number of canisters produced from that sludge batch. Thus, estimating the number of canisters to be produced from each sludge batch is an important part of complying with this specification. In this report, the number of canisters to be produced from each batch of sludge is estimated. This leads to the conclusion that approximately 5200 canisters will be produced by the DWPF through the year 2010. Thereafter, it is conservatively estimated that up to 124 canisters will be produced each year. The errors in these estimates are also discussed.

280 (WSRC-TR–92-260) **Inorganic analyses of volatilized and condensed species within prototypic Defense Waste Processing Facility (DWPF) canistered waste.** Jantzen, C.M. Westinghouse Savannah River Co., Aiken, SC (United States). 30 Jun 1992. 51p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. Order Number DE93001340. Source: OSTI; NTIS; INIS; GPO Dep.

The high-level radioactive waste currently stored in carbon steel tanks at the Savannah River Site (SRS) will be immobilized in a borosilicate glass in the Defense Waste Processing Facility (DWPF). The canistered waste will be sent to a geologic repository for final disposal. The Waste Acceptance Preliminary Specifications (WAPS) require the identification of any inorganic phases that may be present in the canister that may lead to internal corrosion of the canister or that could potentially adversely affect normal canister handling. During vitrification, volatilization of mixed (Na, K, Cs)Cl, $(Na, K, Cs)_2SO_4$, $(Na, K, Cs)BF_4$, $(Na, K)_2B_4O_7$ and $(Na,K)CrO_4$ species from glass melt condensed in the melter off-gas and in the cyclone separator in the canister pour spout vacuum line. A full-scale DWPF prototypic canister filled during Campaign 10 of the SRS Scale Glass Melter was sectioned and examined. Mixed (NaK)Cl, $(NaK)_2SO_4$, (NaK) borates, and a (Na,K) fluoride phase (either NaF or Na_2BF_4) were identified on the interior canister walls, neck, and shoulder above the melt pour surface. Similar deposits were found on the glass melt surface and on glass fracture surfaces. Chromates were not found. Spinel crystals were found associated with the glass pour surface. Reference amounts of the halides and sulfates were found retained in the glass and the glass chemistry, including the distribution of the halides and sulfates, was homogeneous. In all cases where rust was observed, heavy metals (Zn, Ti, Sn) from the cutting blade/fluid were present indicating that the rust was a reaction product of the cutting fluid with glass and heat sensitized canister or with carbon-steel contamination on canister interior. Only minimal water vapor is present so that internal corrosion of the canister, will not occur.

281 (DPST–86-278) **Technetium-99 and Iodine-129 in the burial ground plume.** Oblath, S.B.; Carlton, W.H. Du Pont de Nemours (E.I.) and Co., Aiken, SC (United States). Savannah River Lab. 6 Feb 1986. 13p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. Order Number DE93000520. Source: OSTI; NTIS; INIS; GPO Dep.

As anionic species, both Tc-99 and I-129 are expected to be mobile in the soils beneath the burial ground. These two isotopes were analyzed in groundwater collected from research wells screened in the tritium plume leaving the burial ground. The maximum observed concentrations of 22 pCi/L of Tc-99 and 12 pCi/L of I-129 in the plume wells are above background levels and confirm the mobility of these species. The earlier measurements included in this report have been reported before.1,2 The data indicate that the I-129 concentrations may be increasing with time. Because of the long time (greater than one year) involved in obtaining results for these ultra low-level analyses, this work included analysis of only a few wells inside the burial ground. This limited selection of wells does not permit a mapping of the groundwater concentration isopleths.

285 (INFO–0315) **Plant air quality following accidental radioactive releases: Literature survey and model tests on recirculation and interference for two in-line cubes.** Slawson, P.R. (Envirodyne Limited (Canada)); Hitchman, G.J. Atomic Energy Control Board, Ottawa, ON (Canada). 15 Jul 1987. 50p. Project 2.110.1;Contract DSS 52SS-87035-6-4082. Order Number DE93603679. Source: OSTI; NTIS (US Sales Only); INIS.

Radionuclides exhausted to the atmosphere through vent stacks may contaminate the immediate building structure and/or nearby adjacent buildings resulting in hazardous contaminants entering the intake air. The objective of the work reported here was to obtain an overview of the analytical and experimental tools available to evaluate the transport and diffusion of vented effluents, and the nature of flows about structures, in order to predict the concentrations adjacent to an subsequently inside the immediate and nearby structures. A scaling analysis established the requirements for physical modelling of flows about structures in wind and/or water tunnels. Subsequently, a series of test model studies were conducted in a water tunnel in the Mechanical Engineering Department

of the University of Waterloo. The expected result that increased stack height and structure separation have on reducing recirculation and interference is clearly illustrated. Interference was still significant on the downstream structure when the vent stack height was increased to its maximum of one model cube height above the cube. A literature survey was conducted to establish the nature and mathematical modelling of flows about structures. Also, mathematical modelling of the concentration field from roof-top vent effluents and subsequently the models for predicting concentrations within structures was investigated. No specific data on concentrations within structures were found. There is a strong need for well documented test on the concentration fields about model structures, with which more generic models may be developed. Very little data is available on multiple structures. It is recommended that physical model studies be conducted, that simulate realistic exhaust and intake air vents with measurement of both the inside and the outside concentration fields. (59 refs., 21 figs., 2 tabs.).

286 (INIS-GB–447) **Environmental monitoring programme: Report for 1989 on the environmental impact of authorised discharges of radioactive wastes in England and Wales.** Department of the Environment, London (United Kingdom). Her Majesty's Inspectorate of Pollution. Aug 1991 45p. Order Number DE93605593. Source: OSTI; NTIS (US Sales Only); INIS.

During 1989 there were about 1000 premises in England and Wales authorised to discharge radioactive wastes. The majority of these premises consisted of hospitals, universities and industrial, research or manufacturing centres. Discharges from these premises when made in accordance with the strict conditions specified in their authorisations will have been of little radiological significance. In the case of nuclear sites authorisations or approvals are issued jointly by the DoE and the Ministry of Agriculture, Fisheries and Food (MAFF) known collectively as the Authorising Departments. In Wales these functions are undertaken by the Welsh Office with the support of HMIP and MAFF. The Authorising Departments specify numerical limits on the amounts of radioactivity which operators may discharge to the environment. In addition operators are required to demonstrate that the best practicable means (BPM) to minimise discharges is undertaken. Operators are also required to carry out appropriate environmental monitoring to demonstrate the effectiveness of BPM. As part of their regulatory functions the Authorising Departments undertake their own environmental monitoring programmes to act as both a check on site operator's returns and to provide independent data on the exposure of the public. HM Inspectorate of Pollution has monitored levels of radioactivity in drinking water sources for many years and published results annually. MAFF undertakes two programmes to monitor radioactivity in the aquatic environment and in terrestrial foodstuffs and publishes annual reports. Environmental monitoring programmes undertaken by both nuclear site operators and government departments are summarised. (author).

287 (SKB-TR–91-21) **Aespoe hard rock laboratory. Field investigation methodology and instruments used in the preinvestigation phase, 1986-1990.** Almen, K.E. (Swedish Nuclear Fuel and Waste Management Co., Stockholm (Sweden)); Zellman, O. Swedish Nuclear Fuel and Waste Management Co., Stockholm (Sweden). Dec 1991. 150p. Order Number DE93603574. Source: OSTI; NTIS; INIS.

The Aespoe hard rock laboratory project started in 1986. The pre-investigation phase, 1986-1990, involved extensive field measurements from the surface as well as from boreholes, aimed at characterizing the rock formation with regard to geology, geohydrology, hydrochemistry and rock mechanics. The field investigation methodology used in the project was based on experience from and developments during the previous SKB study site investigation programme. However, in some respects the techniques were changed or modified. Major changes have been possible due to a new drilling technique, telescope-type drilling. This report describes the logistics of the investigation programme, characterized to a large extent by multi-purpose planning and performance of the activities in order to optimize the use of available resources; time, personnel and equipment. Preliminary hydraulic testing and groundwater sampling were conducted during the drilling of each borehole. When the drilling was completed an extensive set of singlehole investigations were carried out: geophysical logging, borehole radar, hydraulic tests of different kinds, water sampling and rock stress measurements. Multipackers were installed in the boreholes as soon as possible after the borehole investigations. The system enables monitoring of groundwater pressure, water sampling and groundwater flow measurements to be performed by means of dilution tests and tracer injection. Boreholes with such equipment were used as observation holes during interference pumping tests and long term hydraulic and tracer tests. The monitoring programme will continue during the subsequent phases of construction and operation of the Aespoe hard rock laboratory. (83 refs., 94 figs.) (au).

288 (SKB-TR–92-11) **Numerical groundwater flow calculations at the Finnsjoen study site - The influence of the regional gradient.** Lindbom, B. (Kemakta Consultants Co., Stockholm (Sweden)); Boghammar, A. Swedish Nuclear Fuel and Waste Management Co., Stockholm (Sweden). Apr 1992. 54p. Order Number DE93603582. Source: OSTI; NTIS; INIS.

The present report describes the modelling efforts of the groundwater flow situation at the Finnsjoen site in northern Uppland, approximately 140 km north of Stockholm. The study forms part of the SKB 91 performance assessment project, and aims at describing the model sensitivity to changes in the prevailing regional gradient, as well as the local, with regard to both direction and magnitude. Particular emphasis has been put into the evaluation of travel times and travel paths form a potential repository, and also on flux values at repository level. The analyses were based on the finite element technique and made use of the NAMMU-code for stationary calculations in three dimensions. The fracture zones within the modelled area were modelled implicitly with an averaging technique. (au).

289 (SKN–59) **Survey of in situ testing at underground laboratories with application to geologic disposal of spent fuel waste in crystalline rock.** Hardin, E. (Reptec Corporation/Swedish Engineering Services (SINTAB), Bromma (Sweden)). National Board for Spent Nuclear Fuel, Stockholm (Sweden). Apr 1992. 205p. Order Number DE93603583. Source: OSTI; NTIS; INIS.

This report is intended for use in designing testing programs, or as backup material for the review of 'R and D 92' which will be the next three-year plan for spent fuel repository siting and characterization activities in Sweden. There are eight major topics, each of which is addressed in a chapter of around 2000 to 10000 words. The major topics are defined to capture the reasons for testing, in a way that limits overlap between chapters. Other goals of this report are to provide current information on recent or ongoing tests in crystalline rock, and to describe insights which are important but not obvious from the literature. No data are presented, but the conclusions of testing programs are summarized. The principal sources were reports (in English) produced by the laboratory projects particularly the Stripa Project (SKB), the Underground Research Laboratory in Canada (AECL), and the Grimsel Test Site in Switzerland (Nagra). Articles from refereed journals have been used in lieu of project literature where possible and appropriate. (au).

290 (SKN–64) **Geological aspects for siting a repository for spent nuclear fuel. Part 2: Geological data on a local level.** Palmqvist, K. (Berggeologiska Undersoekningar AB (BERGAB) (Sweden)). National Board for Spent Nuclear Fuel, Stockholm (Sweden). Jan 1992. 111p. (In Swedish). Order Number DE93603584. Source: OSTI; NTIS; INIS.

The report deals with the methodics and methods used for characterizing the quality of the bedrock connected with underground disposal of radioactive wastes. (32 refs.).

291 (STRIPA-TR–91-17) **Large scale cross hole testing.** Ball, J.K. (Golder Associates, Nottingham (United Kingdom)); Black, J.H.; Doe, T. Swedish Nuclear Fuel and Waste Management Co., Stockholm (Sweden). May 1991. 125p. Order Number DE93603585. Source: OSTI; NTIS; INIS.

As part of the Site Characterisation and Validation programme the results of the large scale cross hole testing have been used to document hydraulic connections across the SCV block, to test conceptual models of fracture zones and obtain hydrogeological properties of the major hydrogeological features. The SCV block is

highly heterogeneous. This heterogeneity is not smoothed out even over scales of hundreds of meters. Results of the interpretation validate the hypothesis of the major fracture zones, A, B and H; not much evidence of minor fracture zones is found. The uncertainty in the flow path, through the fractured rock, causes sever problems in interpretation. Derived values of hydraulic conductivity were found to be in a narrow range of two to three orders of magnitude. Test design did not allow fracture zones to be tested individually. This could be improved by testing the high hydraulic conductivity regions specifically. The Piezomac and single hole equipment worked well. Few, if any, of the tests ran long enough to approach equilibrium. Many observation boreholes showed no response. This could either be because there is no hydraulic connection, or there is a connection but a response is not seen within the time scale of the pumping test. The fractional dimension analysis yielded credible results, and the sinusoidal testing procedure provided an effective means of identifying the dominant hydraulic connections. (10 refs.) (au).

292 (STRIPA-TR–92-04) **Economical and technical optimization of site investigations - a multivariate approach based on Stripa F1 and F2 borehole information.** Schunnesson, H. (EMX Drilltech AB, Luleaa (Sweden)); Lundholm, I. Swedish Nuclear Fuel and Waste Management Co., Stockholm (Sweden). Jan 1992. 79p. Order Number DE93603589. Source: OSTI; NTIS; INIS.

In this report multivariate analysis is presented and used as a tool to optimize site investigations. The technique is tested on earlier accumulated data from bore hole F1 and F2 in the Stripa mine, in an attempt to predict the hydraulic conductivity of the rock. Different investigation methods can be selected only on behalf of their correlation to the hydraulic conductivity and accurate predictions can be made with as high resolution as the core mapping data and the data from the geophysical logging allows. In the second part of the report the integration of this technique in the pre-investigation is discussed. The most important steps is to form a site analysis group, responsible for data collection, analysis and investigation, utilize all at the time available data to improve the investigation. This will also lead to a less rigid and more flexible pre-investigation that will improve the quality and reduce time consumption. (12 refs.)(au).

293 (STRIPA-TR–92-14) **Site characterization and validation - inflow to the validation drift.** Harding, W.G.C. (Golder Associates Ltd., Nottingham (United Kingdom)); Black, J.H. Swedish Nuclear Fuel and Waste Management Co., Stockholm (Sweden). Jan 1992. 105p. Order Number DE93603598. Source: OSTI; NTIS; INIS.

Hydrogeological experiments have had an essential role in the characterization of the drift site on the Stripa project. This report focuses on the methods employed and the results obtained from inflow experiments performed on the excavated drift in stage 5 of the SCV programme. Inflows were collected in sumps on the floor, in plastic sheeting on the upper walls and ceiling, and measured by means of differential humidity of ventilated air at the bulkhead. Detailed evaporation experiments were also undertaken on uncovered areas of the excavated drift. The inflow distribution was determined on the basis of a system of roughly equal sized grid rectangles. The results have highlighted the overriding importance of fractures in the supply of water to the drift site. The validation drift experiment has revealed that in excess of 99% of inflow comes from a 5 m section corresponding to the 'H' zone, and that as much as 57% was observed coming from a single grid square (267). There was considerable heterogeneity even within the 'H' zone, with 38% of such samples areas yielding no flow at all. Model predictions in stage 4 underestimated the very substantial declines in inflow observed in the validation drift when compared to the SDE; this was especially so in the 'good' rock areas. Increased drawdowns in the drift have generated less flow and reduced head responses in nearby boreholes by a similar proportion. This behaviour has been the focus for considerable study in the latter part of the SCV project, and a number of potential processes have been proposed. These include 'transience', stress redistribution resulting from the creation of the drift, chemical precipitation, blast-induced dynamic unloading and related gas intrusion, and degassing. (au).

294 (ANL/CP–76005) **Evaluation of surface water treatment and discharge options for the Weldon Spring Site Remedial Action Project.** Goyette, M.L.; MacDonell, M.M. Argonne National Lab., IL (United States). [1992]. 15p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-921029–6: Annual Department of Energy model conference on waste management and environmental restoration, Oak Ridge, TN (United States), 19-22 Oct 1992). Order Number DE92041105. Source: OSTI; NTIS; INIS; GPO Dep.

The US Department of Energy (DOE), under its Environmental Restoration and Waste Management Program, is responsible for conducting response actions at the Weldon Spring site in St. Charles County, Missouri. The site consists of two noncontiguous areas: (1) the chemical plant area, which includes four raffinate pits and two small ponds, and (2) a 3.6-ha (9-acre) quarry located about 6.4 km (4 mi) southwest of the chemical plant area. Both of these areas became chemically and radioactively contaminated as a result of processing and disposal activities that took place from the 1940s through 1960s. The Weldon Spring site, located about 48 km (30 mi) west of St. Louis, is listed on the National Priorities List of the US Environmental Protection Agency. Nitroaromatic explosives were processed by the Army at the chemical plant area during the 1940s, and radioactive materials were processed by DOE's predecessor agency (the Atomic Energy Commission) during the 1950s and 1960s. Overall remediation of the Weldon Spring site is being addressed through the Weldon Spring Site Remedial Action Project, and it consists of several components. One component is the management of radioactively and chemically contaminated surface water impoundments at the chemical plant area – i.e., the four raffinate pits, Frog Pond, and Ash Pond which was addressed under a separate action and documented in an engineering evaluation/cost analysis report. This report discusses the evaluation of surface water treatment at the Weldon Spring site.

295 (DOE/NV/10845–14) **Community Radiation Monitoring Program: Annual report, October 1, 1990–September 30, 1991.** Cooper, E.N.; McArthur, R.D. Nevada Univ., Reno, NV (United States). Water Resources Center. Jun 1992. 58p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC08-90NV10845. Order Number DE93000385. Source: OSTI; NTIS; GPO Dep.

Publication No. 45095.

The Community Radiation Monitoring Program is a cooperative effort between the US Department of Energy (DOE), the US Environmental Protection Agency (EPA), the Desert Research Institute (DRI), a division of the University and Community College System of Nevada, and the Nuclear Engineering Laboratory of the University of Utah (U of U). This eleventh year of the program began in the summer of 1991 and the work continues as an integral part of the DOE-sponsored long-term offsite radiological monitoring effort that has been conducted by EPA and its predecessors since the inception of nuclear testing at the Nevada Test Site (NTS). The primary objectives of this program are still to increase the understanding by the people who live in the area surrounding the NTS of the activities for which the DOE is responsible, to enhance the performance of radiological sampling and monitoring, and to inform all concerned of the results of those efforts. One of the primary methods used to improve the communication link with the potentially impacted area has been the hiring and training of local citizens as Managers and program representatives in 19 communities adjacent to and downwind from the NTS. These Managers, active science teachers wherever possible, have succeeded, through their training, experience, community standing, and effort, in becoming a very visible, able and valuable asset in this link.

296 (DOE/OR–1060-D1) **Remedial Investigation work plan for Bear Creek Valley Operable Unit 2 (Rust Spoil Area, SY-200 Yard, Spoil Area 1) at the Oak Ridge Y-12 Plant, Oak Ridge, Tennessee.** Oak Ridge Y-12 Plant, TN (United States); Science Applications International Corp., Oak Ridge, TN (United States). Sep 1992. 397p. Sponsored by USDOE, Washington, DC

(United States). DOE Contract AC05-84OS21400. (ES/ER–43-D1;Y/ER/Sub–91-99069/1). Order Number DE92041220. Source: OSTI; NTIS; INIS; GPO Dep.

This Remedial Investigation (RI) work plan contains summaries of geographical, historical, operational, geological, and hydrological information specific to the unit. The potential for release of contamination to receptors through the various media is addressed, and a sampling and analysis plan is presented to determine the extent of release of contamination to the surrounding environment. Proposed activities include walkover radiation surveys at all sites, soil borings at SY-200, piezometer installation and water table sampling at SA-1 and SY-200, and surface water and sediment runoff sampling at all three sites. Data from the site characterization activities will be combined with data from ongoing site-wide monitoring programs (i.e., groundwater, surface water, and biological monitoring) to provide input for a screening-level risk assessment and evaluation of alternative remedial actions.

297 (DOE/OR/21949–341) **Colonie Interim Storage Site annual environmental report for calendar year 1991, Colonie, New York: Formerly Utilized Sites Remedial Action Program (FUSRAP).** Bechtel National, Inc., Oak Ridge, TN (United States). Sep 1992. 179p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-91OR21949. Order Number DE93001267. Source: OSTI; NTIS; INIS; GPO Dep.

This document describes the environmental monitoring program at the Colonie Interim Storage Site (CISS) and surrounding area, implementation of the program, and monitoring results for 1991. Environmental monitoring at CISS began in 1984 when Congress added the site to the US Department of Energy's Formerly Utilized Sites Remedial Action Program. CISS property and surrounding areas were radioactively contaminated by operations conducted by National Lead Industries, which manufactured various components from uranium and thorium from 1958 to 1984. The environmental monitoring program at CISS includes sampling networks for external gamma radiation exposure and for radium-226, thorium-232, and total uranium concentrations in surface water, sediment, and groundwater. Additionally, several nonradiological parameters are measured in groundwater. In 1992 the program will also include sampling networks for radioactive and chemical contaminants in stormwater to meet permit application requirements under the Clean Water Act. Monitoring results are compared with applicable Environmental Protection Agency (EPA) standards, DOE derived concentration guides (DCGs), dose limits, and other requirements in DOE.orders. Environmental standards are established to protect public health and the environment. Results of environmental monitoring during 1991 indicate that average concentrations of radioactive contaminants of concern were well below applicable standards and DCGS. Concentrations of some chemical contaminants in groundwater were above-the New York State Department of Environmental Conservation (Class GA) and EPA guidelines for drinking water. The potential annual radiation exposure (excluding background) calculated for a hypothetical maximally exposed individual is 0.23 mrem (milliroentgen equivalent man), which is less than an individual would receive while traveling in an airplane at 12,000 meters (39,000 feet) for one hour.

298 (ES/CSET–3/R1) **Logic Model Application Guide: Safety Analysis Report Update Program: Revision 1.** Martin Marietta Energy Systems, Inc., Oak Ridge, TN (United States). Jul 1992. 63p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE92040754. Source: OSTI; NTIS; GPO Dep.

The purpose of the Safety Analysis Report (SAR) Update Program is to update safety documentation for all facilities, both nuclear and non-nuclear, operated by Martin Marietta Energy Systems, Inc. Significant hazards and the risk associated with those hazards will be identified by updating the safety documentation. The extensive involvement of operations personnel in the SAR Update Program has already served to enhance both the safety culture and the safe operation of facilities and will continue with the FSETs' participation in the logic model development process. Phase I hazard screening involved all facilities operated by Energy Systems. However, the second part of the Phase I task involves only those facilities classified as either moderate or high hazard in the hazard screening process or specified by the Plant Safety Evaluation Team (PSET). For the moderate or high hazard facilities, additional qualitative logic models will be developed both to identify the causes of specific accidents and to evaluate the possible consequences associated with particular accidents. The purpose of this document is to provide specific guidance on the preparation of the appropriate logic models for use in Phase I of the SAR Update Program. The Logic Model Application Guide (LMAG) will implement and expand on the guidance expressed in ES/CSET-I/R2, particularly Sections 3.6 and 3.7. The methods described in this guide may also be applicable to safety analysis tasks not associated with the SAR update program.

299 (ES/CSET–15) **Safety classification and special design criteria development application guide: Safety Analysis Report Update Program.** Oak Ridge National Lab., TN (United States). Aug 1992. 43p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE92040753. Source: OSTI; NTIS; GPO Dep.

This document is a pilot application guide to the identification of Safety class Items (SCIs) and the development of associated special design criteria. It is intended to interpret, apply, and supplement, where necessary, DOE orders and guidance to make a practical, coherent, risk-based framework for the safety analyst to use identifying SCIs in conjunction with Facility Safety Evaluation Teams (FSETs) for existing facilities and design teams for new and modified facilities. Three categories of Safety Class Items are identified in this guide: SC-1, SC-2, and SC-3. SC-1 items are required primarily to protect the health and safety of the off-site public, SC-2 items are required solely to protect the health and safety of on-site personnel, and SC-3 items are required solely to protect the health and safety of the facility operators. These definitions are taken from DOE/OR-901, Guidance for Preparation of Safety Analysis Reports (ref. 3), Appendix C, "Guidelines for Determination of Safety Class Items."

300 (SAND–92-0684C) **Advanced handling concepts and application to storage and transport systems.** Bennett, P.C.; Sanders, T.L. Sandia National Labs., Albuquerque, NM (United States). [1992]. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. (CONF-9207102–66: Institute of Nuclear Materials Management (INMM) annual meeting, Orlando, FL (United States), 19-22 Jul 1992). Order Number DE92040264. Source: OSTI; NTIS; INIS; GPO Dep.

The application of robotics to the handling of spent fuel casks at a receiving facility such as an MRS is a practical solution to meeting both operator dose limitations and DOE facility design goals. Simple cost/dose trade-off analysis based on International Commission on Radiological Protection (ICRP) methods indicates operator dose can be substantially reduced at potential cost savings by automating the major dose-producing operations. Reliability of robotic systems need not be high to substantially lower handling costs and operator dose. The feasibility of automating many receiving operations has been demonstrated in the laboratory. Demonstrations include visual cask inspection, radiation survey, impact limiter removal, transporter tiedown release and manipulation, cask uprighting and transport, and cask head preparation; including leak testing, gas purging, and lid closure and seal removal.

301 (WSRC-MS–92-278) **Lessons learned from hazardous waste remediation.** Leibfarth, E.C. Westinghouse Savannah River Co., Aiken, SC (United States). [1992]. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. (CONF-9209141–2: 19. annual American Society for Quality Control (ASQC) National Energy Division conference, Orlando, FL (United States), 20-23 Sep 1992). Order Number DE93000708. Source: OSTI; NTIS; GPO Dep.

In the nine-year history of hazardous waste remediation at the Savannah River Site, many techniques have been employed. Since the activities and the technology applied to these activities were new to the Site, many of the techniques employed were new and innovative, and the Site has developed hands on remediation experience. This presentation reviews lessons learned during hazardous waste remediation activities at the Site.

302 (IAEA-INFCIRC–409) **Agreement of 3 August 1992 between the Government of the Republic of Malawi and the International Atomic Energy Agency for the application of safeguards in connection with the Treaty on the Non-Proliferation of Nuclear Weapons.** International Atomic Energy Agency, Vienna (Austria). Sep 1992. 35p. Order Number DE93604048. Source: OSTI; NTIS (US Sales Only); INIS.

Hard copies are available in English, French, Russian and Spanish from IAEA Div. of Publications, Distribution Unit.

The document contains two parts. The first one stipulates the agreement of Malawi to accept safeguards on all source or special fissionable material in all peaceful nuclear activities within its territory, under its jurisdiction or carried out under its control anywhere, for the exclusive purpose of verifying that such material is not diverted to nuclear weapons or other nuclear explosive devices. The second part specifies the procedures to be applied in the implementation of the safeguards provisions of Part I.

303 (KAERI/RR–1095/91) **Technology development for nuclear material accountability.** Hong, Jong Sook (Korea Atomic Energy Research Inst., Daeduk (Korea, Republic of)); Lee, Byung Doo; Cha, Hong Ryul; Choi, Hyoung Nae; Na, Won Woo; Park, Ho Joon; Kim, Eun Ka; Lee, Young Gil; Chun, Yong Bum. A positive on-site verification technique of spent PWR fuel rods in pool at PIEF and a program for MUF evaluation in bulk material handling facility were developed in support of facility operation and IAEA verification activity. When spent fuel was measured by gamma-ray spectrometry the measured intensity of Cs-137 662 KeV gamma-ray from the sample was clearly identified against comparing background. By the MCNP code simulations, the flux of 662 KeV gamma-ray in the collimated rod was also different from that from the adjacent one. Base on this fact it is possible to identify spent fuel without having a rod pulled out of assembly in spent pond. This method may be useful as a spent fuel verification tool for both IAEA and facility operator. It may also contribute to the reduction of manpower and operational time. A system for facility MUF evaluation was established to apply it to the bulk material handling facility. With required input data the evaluation program was run to produce final results for evaluation of the soundness of MUF. This program was tested with real input data from CANDU fuel fabrication facility in KAERI. The outcome showed that sigma MUF was not significant to sigma international but MUF was found to be statistically significant as compared to critical value at 95% confidence interval. (Author).

304 (LA–12387-M) **Nuclear criticality safety: 3-day training course.** Schlesser, J.A. (ed.). Los Alamos National Lab., NM (United States). Nov 1992. 147p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. Order Number DE93002849. Source: OSTI; NTIS; GPO Dep.

This compilation of notes is presented as a source reference for the criticality safety course. It represents the contributions of many people, particularly Tom McLaughlin, the course's primary instructor. At the completion of this training course, the attendee will: (1) be able to define terms commonly used in nuclear criticality safety; (2) be able to appreciate the fundamentals of nuclear criticality safety; (3) be able to identify factors which affect nuclear criticality safety; (4) be able to identify examples of criticality controls as used at Los Alamos; (5) be able to identify examples of circumstances present during criticality accidents; (6) be able to identify examples of safety consciousness required in nuclear criticality safety.

Source: OSTI; NTIS; INIS; GPO Dep.

Oak Ridge National Laboratory (ORNL) operates the Isotope Enrichment Facility for the purpose of providing enriched stable isotopes, selected radioactive isotopes (including the actinides), and isotope-related materials and services for use in various research applications. ORNL is responsible for isotope enrichment and the distribution of approximately 225 nongaseous stable isotopes from 50 multi-isotopic elements. Many enriched isotope products are of prime importance in the fabrication of nuclear targets and the subsequent production of special radionuclides. State-of-the-art techniques to achieve special isotopic, chemical, and physical requirements are performed at ORNL This report describes the status and capabilities of the Isotope Enrichment Facility and the Isotope Research Materials Laboratory as well as emphasizing potential advancements in enrichment capabilities.

308 (KAERI/RR–996/90) **The development of cyclotron radionuclides(II).** Lee, Jong Min (Korea Atomic Energy Research Inst., Daeduk (Korea, Republic of)); Chun, Kwon Soo; Yang, Seong Dae. In this project, the production method of Ga-67 for the diagnosis of malignant tumor using enriched Zn-68, Rb-81 for the lung study and Mn-54 used as standard source were studied. And the quality control methods of Co-55 and Na-22 were established and production method of Tl-201 using enriched material was reviewed. The

target for the mass production of Ga-67 using Zn-68 enriched material was prepared by electroplating. The chemical processing and quality control of Ga-67 and recovery of Zn-68 were established. For the development of Rb-81 → Kr-81m generator, the remotely controlled gas target and chemical processing system were designed. Carrier free Mn-54 was produced via $^{54}Cr(p,n)$ and $^{59}Co(p,\alpha n)$ nuclear reactions and separated by ion-exchange chromatography. The production rates were 4.5μCi/μAh and 11.85μCi/μAh respectively. The measurement of excitation function was carried out for the $^{59}Co(p,\alpha pn)$ ^{54}Mn nuclear reaction in the energy range 50.5→0 MeV. Then the maximum cross section was 47.48mb at 41.2MeV and the threshold energy was 27.3MeV. (Author).

309 (AECL–10032) **Sensitivity analysis of a reaction model for the radiation treatment of combustion gases.** Dickson, L.W. (Atomic Energy of Canada Ltd., Chalk River, ON (Canada). Chalk River Nuclear Labs.); Paquette, J.; Busi, F.; D'Angelantonio, M. Atomic Energy of Canada Ltd., Pinawa, MB (Canada). Whiteshell Nuclear Research Establishment. Jul 1991. 32p. Order Number DE93603765. Source: OSTI; NTIS (US Sales Only); INIS.

Sensitivity analyses were performed on chemical mechanisms for the treatment of combustion flue gases with high-energy radiation. The sensitivity analysis of the radical production reactions showed that the radical concentrations did not depend strongly on most of the ion-molecule reaction rates. A simplified radical production model was developed based on this result. Sensitivity analyses performed on the NO_x and NO_x/SO_2 removal mechanisms showed that most of the radical-radical reactions could be removed from these mechanisms without affecting the predicted major species concentrations. The sensitivity analysis results provided a useful guide for model reduction, but some chemical knowledge was also required to interpret the implications of the sensitivity analysis correctly. (7 tabs., 3 figs., 39 refs.).

310 (ANL/CP–76009) **Diffusion-induced grain boundary migration during ion beam mixing of Au/Cu bilayers.** Alexander, D.E.; Baldo, P.M.; Rehn, L.E. Argonne National Lab., IL (United States). Sep 1992. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-9209200–4: 8. international conference on ion beam modification of materials, Heidelberg (Germany), 7-11 Sep 1992). Order Number DE93000508. Source: OSTI; NTIS; INIS; GPO Dep.

Experiments were performed to evaluate the effect of 1.5 MeV Kr irradiation on diffusion-induced grain boundary migration (DIGM) in Au/Cu bilayers in the temperature range of $300 \leq T \leq 050$K. The experimental results were consistent with DIGM occurring in bilayers both during irradiation and during annealing treatments. Rutherford backscattering spectrometry showed a nearly uniform distribution of Cu present through the entire thickness of appropriately prepared polycrystalline Au films irradiated or annealed at temperatures $\geq$400K. No parallel effect was seen in similarly treated single-crystal films. In each polycrystalline sample studied, irradiation resulted in greater amounts of Cu present uniformly in the Au compared to annealing-only. The magnitudes of measured Cu compositions were substantially greater than that expected solely from grain boundary diffusion. A simple analysis of the process indicated that ion irradiation affects DIGM by increasing the composition of Cu present in alloyed zones and/or by increasing the grain boundary velocity in the Au.

311 (BNL–47801) **Position and wavelength stability of the X25 doubly-focussed monochromatic beam.** Berman, L. Brookhaven National Lab., Upton, NY (United States). Jul 1992. 38p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016. Order Number DE92041277. Source: OSTI; NTIS; INIS; GPO Dep.

One of the primary requirements of x-ray scattering experiments is stability of the incident beam, in position and wavelength. If this requirement is met, variations in the incident monochromatic beam intensity, resulting, for instance, from the changing current in the storage ring, can be properly normalized using an incident beam intensity monitor. If the incident beam's position or wavelength varies, however, then normalizing to an incident intensity monitor becomes less reliable, because the monitor, scattering sample, and downstream detector can have different response sensitivities to position and wavelength. The problem gets worse if the incident beam is contaminated with harmonics, for the harmonic profile usually differs substantially from the fundamental profile. Beam line optics are often misaligned intentionally to reduce harmonic contamination to avoid, e.g., detector saturation, yet position and wavelength instabilities can give rise to a time-varying harmonic content in the incident beam. This report summarizes measurements of the position and wavelength stabilities of the X25 doubly-focussed monochromatic beam, performed at 8 key using Si(III) monochromator crystals. Plans and suggestions for improving these are also discussed.

312 (EGG–10617-3012) **The Sealed Tube Neutron Generator.** Tunnell, L.N.; Beyerle, A.; Durkee, R.; Headley, G.; Hurley, P. EG and G Energy Measurements, Inc., Santa Barbara, CA (United States). Special Technologies Lab. [1992]. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC08-88NV10617. (CONF-921116–1: 12. international conference on the application of accelerators in research and industry, Denton, TX (United States), 2-5 Nov 1992). Order Number DE93000691. Source: OSTI; NTIS; INIS; GPO Dep.

A Sealed Tube Neutron Generator (STNG) has been designed and tested at Special Technologies Laboratories (STL) in Santa Barbara, California. Unlike similar tubes that have been used for years in other applications, e.g., by the oil well logging industry, the present device was designed primarily to be part of the Associated Particle Imaging (API) system. Consequently, the size and quality of the neutron spot produced by the STNG is of primary importance. Results from initial measurements indicate that performance goals are satisfied.

313 (EUR–13647/III, pp. 993-1012) **Quantitative analysis and automation of CaF_2 ore flotation via neutronic activation.** Reggiani, F. (Bologna Univ. (Italy)); Garagnani, A.; Lembo, L.; Muntoni, C. Commission of the European Communities, Luxembourg (Luxembourg). 1992. Contract MA 1M-0061-C. In *Summary reports of the R and D programme: primary raw materials (1986-89) - Volume III.* 1046p. Order Number DE93720867. Source: OSTI; NTIS (US Sales Only); INIS.

The aim of the project was to prove the operative feasibility of an 'one line analysis' based on nuclear activation using 14 MeV neutrons. This on line analysis method was to be used to automate control of the flotation process for ores containing mostly fluorspar. The thermoluminescence technique was also forecast as a subsidiary method in those points of the flotation cycle where less precision is acceptable. (author). 11 figs., 4 tabs.

314 (EUR–13647/III, pp. 1013-1030) **On-line analysis of cement raw materials by prompt gamma neutron activation analysis.** Pinault, J.L. (Bureau de Recherches Geologiques et Minieres (BRGM), 45 - Orleans (France)). Commission of the European Communities, Luxembourg (Luxembourg). 1992. Contract MA1M-0066. In *Summary reports of the R and D programme: primary raw materials (1986-89) - Volume III.* 1046p. Order Number DE93720867. Source: OSTI; NTIS (US Sales Only); INIS.

This paper presents raw materials on-line analysis by prompt gamma neutron activation analysis. Two types of products are analysed: a coarse, pre-crushed material on a belt-conveyor, and a fine material before its introduction into the kiln (the meal flows around the detector). (A.B.).

315 (EUR–14363, pp. 149-164) **Dismantling of cells 22, 23 and 24 for the fabrication of caesium and strontium sources at CE Saclay ORIS pilot facility.** Maurel, J.J. (CEA Centre d'Etudes Nucleaires de Saclay, 91 - Gif-sur-Yvette (France). Direction du Cycle du Combustible); Garcia, A.; Moreau, J.C. Commission of the European Communities, Luxembourg (Luxembourg). 1992. (CONF-9109441–: 2. Seminar on practical decommissioning experience with nuclear installations in the European Community,

Sellafield (United Kingdom), 25-26 Sep 1991). In *Practical decommissioning experience with nuclear installations in the European Community*. 207p. Order Number DE93721081. Source: OSTI; NTIS (US Sales Only); INIS.

The cleaning an dismantling of the three hot cells in ORIS Industrie building are not very heavy operation. The surface of the work is reduced; so it is just possible to have only four or five operators at the same time. It is the reason for a long operation delay. The main technical difficulty of these operations consists in: - very high level of radioactivity measured on same apparatus (7000 rad on a press). They must be evacuated without disturbing the industrial production of ORIS Industrie. - putting of working area and the identification of relations between the different intervening parties.

We have endeavored to learn to learn how different DNA sequences and sequence arrangements contribute to genome plasticity in maize. We describe quantitative variation among maize inbred lines for tandemly arrayed and dispersed repeated DNA sequences and gene families, and qualitative variation for sequences homologous to the Mutator family of transposons. The potential of these sequences to undergo unequal crossing over, non-allelic (ectopic) recombination and transposition makes them a source of genome instability. We have found examples of rapid genomic change involving these sequences in F1 hybrids, tissue culture cells and regenerated plants.

319 (NEI-DK–991) **Energy forests - cultivation and working economy.** Skovbrugsserien, 3-1992. Kelkjaer, J. Landbrugsministeriet, Copenhagen (Denmark). Forskningscentret for Skov og Landskab. 1992. 140p. (In Danish). Contract ENS-1383/89-6. Order Number DE93721416. Source: OSTI; NTIS.

EFP-89.

The aim when cultivating energy forests is to maximize the biomass production through intensive cultivation of tree species with a fast juvenile growth. A suitably short cutting cycle can be used to avoid juvenile growth being replaced by slower growth. The ability to coppice shoots is essential in order to avoid costs of new eatablishment after each harvest. Short rotation forestry is a type of cultivation which depends on the fast juvenile growth of a few broad-leaved species and their ability for cutting reproduction and formation of stump shoots. Through intensive cultivation, these characteristics are exploited with the aim of producing biomass which is used for the production of energy. Prior to stand establishment the soil must be thoroughly cultivated and weed control is essential. A cutting cycle of 3-5 years and a plant intensity of 18.000 per two and a half acres is appropriate. Fertilization is necessary. Watering is necessary in dryer periods. Fungus disease, insect and mammal attacks etc. are more likely in these large monoclonal and homogenous production units, and must be controlled. The mean level of biomass production in Denmark can reach 8-10 tons of dry matter per 2 1/2 acres p.a. Analysis shows that production is profitable at an estimated interest rate of 3% if the energy forests are run in 4 or 5 cutting cycles and long life spans and if irrigation is unnecessary, yet profitability is estimated to be moderate. Methods of reducing production costs are suggested. (AB) (112 refs.).

EFP-89.

Climatic data, measurements from the growth year 1991, and an analysis and summary of production results from the growth years 1989-1991 are given. The above-ground leafless dry matter production as well as quality and quantity of contributing factors have been registered on 12 production sites distributed over five localities in Denmark. These sites are grown intensively and are representative for the predominating soil and climate conditions in that county. The mean production level of the period is 6-8 tons dry matter per two and a half acres per year. There is considerable variation between the examined localities and from one growth year to another. It is reckoned that the recorded decrease in production in the 1991 growth year is caused by the fact that there was less annual rainfall than usual. The Danish Forest and Landscape Research Institute finds it likely that production potential is higher than the registered mean level of 6-8 tons per 2 1/2 acres p.a.. It is felt that levels can reach 8-10 tons. Utilized measurement methods were the "Mean stool", and "Harvesting" methods and "Plot harvests". The latter method is rather labour intensive and destructive for the production site. Uncertainties related to these methods are insignificant. (AB).

The Energy Biosciences (EB) program addresses fundamental biological mechanisms in plants and microorganisms not studied in the health field. The mission is to build foundations of knowledge in order to provide bases for new and improved biotechnologies that relate to energy matters. One of the major objectives of the EB program is to probe the enormous capabilities of these organism s to carry out biochemical conversions. For centuries, cultures around the world have depended on plants and microbes for their food, fiber, medicine, fuel, plus a wide variety of other uses. But the earlier usages were the result of empirical findings without the benefit of the powerful research approaches now becoming available. Approaches such as molecular biology, analytical chemistry, computational analysis and others have opened entirely new horizons and opportunities. The limitations are functions of the

commitments being made in generating and merging the new knowledge to realize entirely new products and processes via biotechnology. One of the crucial ingredients to this effort is the study of the basic biology of organisms. The EB program is aimed at generating a sufficient breadth of understanding of basic biological mechanisms so that principles of organisms' growth, survival, maintenance, morphological and biochemical characteristics, and energy utilization will be understood. Ultimately, such knowledge will underpin new biotechnologies. This information is crucial to assure that the technologies that emerge not only serve the needs of society, but do so without unexpected risks to both the health of people and the environment in which they live.

322 (DOE/ER/13739–1) **Molecular studies of functional aspects of plant mitochondria: Progress report.** Siedow, J.N. Duke Univ., Durham, NC (United States). Dept. of Botany. 3 Mar 1992. 37p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG05-87ER13739. Order Number DE93000676. Source: OSTI; NTIS; GPO Dep.

The goal of this research is to characterize the mechanism by which a protein encoded by mitochondrial genome of cms-T maize (URF13) interacts with a family of the compounds produced by certain fungi (T-toxins) to permeabilize biological membranes. The research carried out during the current funding period has focused on the structure of URF13, and the results support the validity of the three-helix model of URF13 and provide direct evidence for the oligomeric nature of at least some of the URF13 molecules in the membrane. In addition, the toxin binding studies have provided insight into the dynamic nature of the T-toxin:URF13 interaction and the extent to which Asp-39 is crucial to the interaction that leads to membrane pore formation. Additional knowledge of the structure of URF13 is needed if the nature of the interaction between URF13 and T-toxin to produce a hydrophilic pore within the membrane is to ultimately be understood.

(A/S Marius Pedersen, Ingenioer og entreprenoerfirma (DK)); Rasmussen, K. Dansk Komite for Affald (DAKOFA), Copenhagen (Denmark). 1992. 278p. (CONF-9206295–: 1. International conference and exhibition on biological waste treatment, Herning (Denmark), 1-4 Jun 1992). In *Biowaste'92: Proceedings.* Order Number DE93721513. Source: OSTI; NTIS.

Sponsored by: ISWA and IAWPRC.

The Government action programme for household waste is to increase the recycling up to 40-50% in the course of the 90'ies. This implies, however, that the organic waste forms part of the recycling and is to be composted in a low or high technology plant, or treated in a biogas system. As a natural consequence hereof comes the development of collection systems to secure a high degree of recycling and at the same time to consider the working environment circumstances when collecting the organic waste. Furthermore cost reducing collection systems will be of great importance when the municipalities decide on a new refuse system. (au).

324 (NEI-DK–962) **Handling comminuted straw: A preliminary study.** Astrupgaard, N.P. DK-Teknik, Soeborg (Denmark). Jul 1992 72p. (In Danish). Contract ENS-51161-91.0057;Contract ENS-51161-91.0078. Order Number DE93721422. Source: OSTI; NTIS.

The handling of comminuted straw out in the fields is investigated partly to determine whether it is possible to store sliced straw under the open sky and partly to document relevant economical aspects. Time was also taken on the slicing of the straw in relation to a JF 3500 and a Taarup 1030 cutting machine. The cost was 0,05 DKK per kilo in the field with the best machine. The cost of transport per kilometer from field to middle storage facility and loading for storage was under 0,10 kr/kg, which is half the price in the case of bales. Alternative modes of transport were significantly more expensive as it took a long time to load. Three stacks of sliced straw with varying moisture content were examined, moisture contents were 10% rising to 15% after 4 months, and 32% and 20% with no change by December. Storage in facilities with domed tops cost 5 1/2 oere/kg. The overall price of handling sliced straw was shown to be half of that for handling straw in bales, this does not include transport. It is suggested that transport costs would be about the same as is the case for bales, possibly 50% higher. A tabel of specified costs in relation to the handling of straw is presented. (AB).

325 (NEI-DK–990) **Sludge and sewage fertilization in forests and energy plantations.** Skovbrugsserien, 2-1992. Hauge Nielsen, K. Landbrugsministeriet, Copenhagen (Denmark). Forskningscentret for Skov og Landskab. 1992. 50p. (In Danish). Order Number DE93721417. Source: OSTI; NTIS.

The use of municipal sewage sludge and other organic wastes as fertilizers has major drawbacks due to their content of pathogens and heavy metals. An enhanced use of organic waste as a fertilizer in non-food crops of little recreational value offers a solution. The growing of hardwoods in short rotation intensive culture (SRIC) for energy purposes is discussed. The net nutrient demand in forest stands is normally small as the amount of nutrients removed following silvicultural practices is small. In the process of harvesting of such stands, substantial amounts of nutrients can be removed. In such instances the application of organic waste can be of great growth enhancing value. A long-term problem is posed by the heavy metal content of the organic wastes. Most heavy metals are released very slowly to the soil solution so that plant uptake is generally small. When growing SRIC, large amounts of nutrients are removed with the crop and organic wastes can be applied regularly. High dry matter increments might be a result of such fertilization. Burning the wood crops for energy is best undertaken in larger boilers where combustion can be controlled. 15-20% of the nitrogen content is converted into NO_x, which return to the surroundings as nitrate. The main part of the remainder is converted to dinitrogen gas and is thus taken out of the ecosystem. The heavy metal content in the ash may be too large for potential use of this ash for fertilization purposes. (AB) (77 refs.).

In support of studies for developing the coprocessing of fossil fuels with biomass by the Hydrocarb Process, experimental and process design data are reported. The experimental work includes the hydropryolysis of biomass and the thermal decomposition of methane in a tubular reactor. The rates of reaction and conversion were obtained at temperature and pressure conditions pertaining to a Hydrocarb Process design. A Process Simulation Computer Model was used to design the process and obtain complete energy and mass balances. Multiple feedstocks including biomass with natural gas and biomass with coal were evaluated. Additional feedstocks including green waste, sewage sludge and digester gas were also evaluated for a pilot plant unit.

327 (DOE/ER/13498–T3) **Molecular biology and genetics of the acetate-utilizing methanogenic bacteria: Progress report, [July 1, 1988–June 30, 1991].** Gunsalus, R.P. California Univ., Los Angeles, CA (United States). Dept. of Microbiology. [1991]. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG03-86ER13498. Order Number DE93000780. Source: OSTI; NTIS; GPO Dep.

Acetate conversion to methane and $C0_2$ by the methanogenic archaebacteria is a primary rate limiting step in anaerobic biodegradative processes in nature. However, the genetic study of these organisms has not been experimentally tractable due to the inability to grow and plate the organisms as single cells, and to extract high molecular weight DNA and RNA without shearing. The acetate-utilizing species, Methanosarcina thermolphila TM-1, is being used for the proposed genetic and molecular studies because, unlike previously described acetotrophic methanosarcina that have a thick heteropolysaccharide cell wall, this species can be cultured

in a unicellular form that has a protein cell wall lacking the heteropolysaccharide layer. These cells can be gently disrupted to obtain protoplasts or lysed to yield intact genomic DNA and RNA. Experiments are in progress to develop a gene transfer system in this bacterial species. Methods are being developed and refined for the efficient plating of M. thermophila on defined media, for chemical mutagenesis, and for the isolation of mutants defective in acetate utilization. Chromosomal DNA libraries have been constructed from M. thermophila and are being used to clone genes involved in the acetate utilization pathway (e.g. carbon monoxide dehydrogenase). Once cloned, analysis of the molecular mechanisms responsible for their regulatory control will be performed. These studies should aid our understanding of the pathway for acetate utilization in M. thermophila and serve as a model for elucidating regulatory mechanisms in the acetotrophic methanogens.

328 (DOE/ER/14011–2) **Analysis of thermally-stable electron transport factors from the hyperthermophilic archaebacterium Pyrodictium brockii: Progress report.** Johns Hopkins Univ., Baltimore, MD (United States). Sep 1992. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-89ER14011. Order Number DE93003120. Source: OSTI; NTIS; GPO Dep.

The mechanisms by which hyperthermophilic archaebacteria grow and carry out metabolic functions at elevated temperatures have yet to be determined. The objective of this work is to develop an understanding of the metabolic characteristics of, and the electron transport enzymes involved in, hydrogen/sulfur transformation by hyperthermophilic archaebacteria. Efforts focus on the autotrophic H_2-oxidizing bacterium, Pyrodictium brockii which has an optimum growth temperature of 105°C. Biochemical and genetic characterization of enzymes involved in hydrogen oxidizing electron transport pathway. These including investigating the role of the membrane lipids in protecting the hydrogenase enzyme from thermal inactivation, characterization of a quinone and a c-type cytochrome, and analysis of the topology in the membrane in the net energy generating components are reported. The long-term goal is to understand some of the factors contributing to the biochemical basis of extreme thermophily.

329 (EUR–13026) **Italian Ryegrass as a source of fermentable sugars and protein feedstuff.** McGRATH, D. Commission of the European Communities, Luxembourg (Luxembourg). 1990. 33p. Contract No. EN 3B-0049-IRL. Source: OSTI; NTIS (US Sales Only).

The purpose of the investigation was (1) to investigate the potential of grasses, and of Italian ryegrasses in particular, to supply water-soluble (WSC) and (II) to examine the potential of the WSC component for ethanol production and of residual grass for animal feed. WSC production of 5 Italian ryegrass cultivars and of 17 other cultivars, representative of hybrid Italian and perennial ryegrasses and of tall fescue, timothy, and cocksfoot, were examined. 13 refs., 26 tabs.

330 (EUR–14017/1) **Landfill gas from environment to energy.** Gendebien, A. (Louvain Univ. (Belgium)); Pauwels, M.; Constant, M.; Ledrut-Damanet, M.J.; Nyns, E.J.; Fabry, R.; Ferrero, G.L.; Willumsen, H.C.; Butson, J. Commission of the European Communities, Luxembourg (Luxembourg). 1992. 865p. Contract 88-B-7030-11-3-17. Source: OSTI; NTIS (US Sales Only).

Landfill gas is an alternative source of energy which can be commercially exploited wherever municipal solid wastes are disposed of in sanitary landfills. In this context, it was decided to launch a comprehensive study on the subject of energy valorization of landfill gas. The main topics dealt with in the study, which is supported by a comprehensive literature survey and six detailed case-studies, include; (i) the environmental impact of landfill gas, (ii) the process of landfill gas genesis and the technology of landfill gas control by its exploitation, (iii) the monitoring of landfill gas emissions, (iv) the policies and legal aspects of landfill gas in the European Community and in the world, (v) the estimation of landfill gas potentials and economics of landfill gas control and exploitation, (vi) the status of landfill gas exploitation in the European Community and in the world. (authors). refs., figs., tabs.

331 (NEDO-P–9111) **Study of applicability of technology for fuel alcohol production.** New Energy and Industrial Technology Development Organization, Tokyo (Japan). Mar 1992. 198p. (In Japanese). Sponsored by New Energy and Industrial Technology Development Organization, Tokyo (Japan). Order Number DE93723963. Source: OSTI; NTIS.

The paper classifies biomass, raw material for alcohol production, into sugar, starch and lignocellulose groups and studies its raw material situation, the present status of ethanol production technology using these materials, applicability of new production technologies, problems of the new technologies and the future outlook with consideration thereof. As a new ethanol production technology from sugar biomass, presented is a continuous fermentation process using zymomonas developed in a joint study of NEDO and FARA (Fuel Alcohol Research Association). It is suggested that the production cost is lower than that in Melle Boinot method. The flash fermentation process developed by a NEDO-FARA joint research as a new ethanol production method from starch biomass suggests a possibility of about 6% reduction of the production cost, compared with the conventional batch method. The direct fermentation process using clostridium developed by a NEDO-FARA joint research as a new ethanol production technology from lignocellulose biomass suggests an approximate 72 yen/l reduction if the fermentation yield can be increased up to 90%. 74 refs., 59 figs. 67 tabs.

332 (NEI-DK–957, pp. 1-10) **The anaerobic option for solid waste processing.** Chynoweth, D.P. (Department of Agricultural Engineering, University of Florida, Gainesville, Florida (US)); Owens, J.M. Dansk Komite for Affald (DAKOFA), Copenhagen (Denmark). 1992. 278p. (CONF-9206295–: 1. International conference and exhibition on biological waste treatment, Herning (Denmark), 1-4 Jun 1992). In *Biowaste'92: Proceedings.* Order Number DE93721513. Source: OSTI; NTIS.

Sponsored by: ISWA and IAWPRC.

Aerobic composting and anaerobic, high-solids digestion (anaerobic composting) are both options for treatment of organic wastes. The main advantages of anaerobic composting are the lack of aeration requirements and production of methane. Despite these advantages, anaerobic composting is not well known while many aerobic solid waste treatment facilities are under operation, or being constructed in the U.S. The primary reasons for this are the public's greater familiarity with aerobic systems and the perceived difficulty in reliable operation of anaerobic systems now commercially available. (au) 27 refs.

Dansk Komite for Affald (DAKOFA), Copenhagen (Denmark). 1992. 278p. (CONF-9206295–: 1. International conference and exhibition on biological waste treatment, Herning (Denmark), 1-4 Jun 1992). In *Biowaste'92: Proceedings.* Order Number DE93721513. Source: OSTI; NTIS.

Sponsored by: ISWA and IAWPRC.

Herning Municipal utilities has in 1991 constructed a biogas plant for thermophilic digestion of source separated organic household waste and liquid manure in combination. In the research periode, treatment consists of pretreatment, digestion and posttreatment of 1,000 tons of source-separated organic household waste mixed with liquid manure in the ratio 1:4. The plant is situated next to the already existing biogasplant in Sinding-Oerre. So far the results seem very promising. The gasproduction is more than 100 Nm^3 gas per ton household waste and the produced fertilizer product is clean and with content of heavy metals below the limit value. The amount of material lost by separation is very low, less than 8 percent of the received household waste. (au).

334 (NEI-DK–957, pp. 1-6) **Full scale biogas plant for source separated solid waste.** Roegen, K.L. (Carl Bro A/S, Consulting Engineers and Planners, Glostrup (DK)); Kraemer, S. Dansk Komite for Affald (DAKOFA), Copenhagen (Denmark). 1992. 278p. (CONF-9206295–: 1. International conference and exhibition on biological waste treatment, Herning (Denmark), 1-4 Jun 1992). In *Biowaste'92: Proceedings.* Order Number DE93721513. Source: OSTI; NTIS.

Sponsored by: ISWA and IAWPRC.

The process plant has been designed to treat approx. 20,000 tons of biowaste or other types of organic matter per year. The receiving part of the plant will be in operation within "normal" working hours, whereas the process plant, including the pretreatment process, will be in continous operation. The plant will be constructed with automatic control and supervision, and the plant will only be manned when the receiving part is in operation ("normal working hours"). The multi-stage process utilized is based on decomposition of the biowaste, immediately after it has been received, to a type of pulp which can be pumped. Therefore, the internal transport at the plant mainly takes place in closed piping systems, and storage takes place in closed, gas-tight tanks. The process design is described in additon to the mass balance and the economy. (AB).

In *Biowaste'92: Proceedings.* Order Number DE93721513. Source: OSTI; NTIS.

Sponsored by: ISWA and IAWPRC.

Combined anaerobic digestion of manure together with organic industrial waste and source-sorted household waste have been applied in the large-scale biogas plant in Denmark. Experiments performed in the plants showed that addition of industrial waste to reactors digesting cattle manure as basis substrate clearly increased the biogas yield of the reactors and at the same time stabilized the process. Addition of lipids can inhibit the biogas process. The inhibition can be overcome by inoculating with small amounts of cultures degrading long-chain fatty acids. Data from anaerobic digestion of source-sorted household waste in lab-scale reactors showed that this waste is highly degradable (approx. 80% conversion to biogas). This result was further confirmed by full-scale reactor experiments. (au) (13 refs.).

Sponsored by: ISWA and IAWPRC.

A possible future alternative for the treatment of organic material inmunicipal solid waste is anaerobic digestion at a TS concentration of around 10%. The results from a successful pilot plant experiment were reported. An existing 900 m^3 full scale anaerobic digester for municipal sludge was reconstructed for digestion of a mixture of sorted municipal solid waste and municipal sludge. The reconstruction of the anaerobic digester system involved the installation of a novel milling stage for size reduction of incoming waste, removal of unsuitable materials, such as glass, metals etc and preparation of a feedstock with a TS concentration of 10%. The anaerobic digester has been equipped with a mechanical mixing system. The system also comprises an internal water recirculation system, allowing a minimal production of waste water for further treatment. The retrofitted digester was started in September 1991 and the milling station and the separation system in April 1992. During the demonstration operation, the interest is focused on the following key areas: May the succesful results in a 20 m^3 pilot plant be realised also on a full scale? Is it possible to solve potential accumulation problems? Is the reliability and durability of the milling equipment chosen? In the paper, the full scale plant is presented as well as initial results of operation. (au).

Sponsored by: ISWA and IAWPRC.

The VALORGA process is a technique for processing biodegradable organic wastes. The main objectives are to maximize the value of the organic matter and protection of the environment. The process is particularly suited for treating the fermentable fraction of Municipal Solid Wastes (MSW) coming from source separation but can be used entirely satisfactorily with a front-end sorting system after mixed MSW collection. When necessary, the refuse is sorted to separate biodegradable substances from materials which can be recycled (glass, ferrous metals) or burned. The fermentable fraction is subjected to Anaerobic Digestion in a oxygen-free tank called a DIGESTER. Anaerobic Digestion produces a large amount of methane-rich gas, called BIOGAS, which can be used in numerous ways. After treatment, the solid effluent forms a high quality organic enriching agent for the soil, called DIGESTATE. (au).

339 (NEI-DK–957, pp. 1-8) **A moderate land limited swine waste bio-treatment alternative for the tropics.** Yang, P.Y. (Agricultural Engineering Department, University of Hawaii at Manoa, Honolulu, Hawaii (US)); Yamamoto, D.K.; Chen, H. Dansk Komite for Affald (DAKOFA), Copenhagen (Denmark). 1992. 278p. (CONF-9206295–: 1. International conference and exhibition on biological waste treatment, Herning (Denmark), 1-4 Jun 1992). In *Biowaste'92: Proceedings.* Order Number DE93721513. Source: OSTI; NTIS.

Sponsored by: ISWA and IAWPRC.

An integrated biotreatment system including a modified hybrid anaerobic treatment for concentrated swine waste and combined anaerobic biofixed film and aquatic plant for dilute raw and anaerobically treated swine wastewater was investigated. It was found that the system could effectively remove both the organics (based on oxygen demand) and inorganics (based on nitrogen). Because of the nature of the design and operational criteria, these two biotreatment processes can be prefabricated into package plants which can further reduce the problems associated with technology transfer problems. The present system is considered to be more appropriate in the tropics where the land is moderately available. Also, the system can be modified easily for the recovery of bioenergy and animal feed, pollution control and reuse of treated wastewater. (au).

340 (NEI-DK–957, pp. 1-10) **Sequential batch anaerobic composting (SEBAC™) of solid wastes.** Chynoweth, D.P. (Department of Agricultural Engineering, University of Florida, Gainesville, Florida (US)); O'Keefe, D.M.; Barkdoll, A.W.; Owens, J.M.; Legrand, R. Dansk Komite for Affald (DAKOFA), Copenhagen (Denmark). 1992. 278p. (CONF-9206295–: 1. International conference and exhibition on biological waste treatment, Herning (Denmark), 1-4 Jun 1992). Sponsored by: ISWA and IAWPRC.

Anaerobic high-solids digestion (anaerobic composting) is an attractive option for treatment of organic wastes. The main advantages of anaerobic composting are the lack of aeration requirements and production of methane. An anaerobic composting design, sequential batch anaerobic composting (SEBAC™), has been developed and demonstrated at the pilot scale which has proven to be stable and effective for treatment of the non-yeard

waste and yard waste organic fractions of municipal solid waste (MSW). The design employs leachate recycle for wetting, inoculation, and removal of volatile organic acids during startup. Performance is similar to that of other designs requiring heavy solids inoculation and mixing and which do not have a mechanism for volatile organic acid removal during imbalance. (au) (12 refs.).

341 (NEI-DK–957, pp. 1-10) **Enhancement of two step anaerobic degradation by enzyme addition.** Lagerkvist, A. (The Landfill Group, Luleaa University of Technology, Luleaa (SE)); Huimin Chen. Dansk Komite for Affald (DAKOFA), Copenhagen (Denmark). 1992. 278p. (CONF-9206295–: 1. International conference and exhibition on biological waste treatment, Herning (Denmark), 1-4 Jun 1992). In *Biowaste'92: Proceedings.* Order Number DE93721513. Source: OSTI; NTIS.

Sponsored by: ISWA and IAWPRC.

The addition of cellulolytic enzymes to MSW have been tried under methanogenic and acidogenic conditions in 0,1 m^3 landfill models. An enhanced degradation of MSW was observed in both cases. The enzyme additon did not result in a change from methanogenic to acidogenic conditions. The overall conversion of VS to gas was in excess of 50% in the methanogenic models. Enzyme addition appears to stimulate the degradation of VS and cellulose in particular. (au).

Source: OSTI; NTIS.

Sponsored by: ISWA and IAWPRC.

In traditional China, both human and animal wastes have never been a problem because every family was responsible for the collection and disposal of its own wastes. It was not because of any law of the land. To the Cinese man, woman and child all wastes were considered as valuable resources that should be recycled as nutrients in the soil to make plants grow in order to produce food to survive, and to grow feed for domestic animals and birds, fibre for clothing, and fiber for wooden parts of buildings and furniture, with the residues used as firewood. All these basic needs were dependent on the proper management of wastes which were produced every day, in peace as well as in war time. They allowed China to feed a big and increasing population on limited arable land for millenia, and helped maintain the longest civilisation on earth. In this paper, we look at various case studies of biological waste established villages, small towns, district and county towns, provincial capitals, and the interaction between rural, suburban and urban areas. We also look at the positive improvements of the traditional systems, the dubious benefits of adding external artificial inputs to them, and the negative effects of modern development on the physical and cultural environment. We should not just look at the financial gains, which are undoubtedly very impressive despite excessive wastage of our limited resources, but we should not ignore the hidden costs of pollution that we force upon our future generations to pay for our irresponsible neglect. (au).

343 (NEI-DK–957, pp. 1-5) **Anaerobic conversion of biowaste by means of the Dranco process.** Six, W. (Organic Waste Systems, Gent (BE)); Baere, L. De. Dansk Komite for Affald (DAKOFA), Copenhagen (Denmark). 1992. 278p. (CONF-9206295–: 1. International conference and exhibition on biological waste treatment, Herning (Denmark), 1-4 Jun 1992). In *Biowaste'92: Proceedings.* Order Number DE93721513. Source: OSTI; NTIS.

Sponsored by: ISWA and IAWPRC.

The Dranco process has been developed for the conversion of solid organic wastes, specifically the organic fraction of municipal solid waste, to energy and a humus-like product, called Humotex. The process can be compared to a landfill gas production process, accelerated by a factor 1000. A Dranco installation with a digester of 808 m^3 treating 10.500 tons of source separated organic wastes per year. A demonstration plant of 56 m^3 in Gent, using mixed garbage as feedstock between 1984 and 1991, and source separated waste since July 1991 is also discussed. The operating temperature in the digester is 55 deg. C and the total solids concentration is ca. 32%. During the operation using the organic fraction of mixed garbage as a feedstock, the mean gas production rate was 3.3 Nm^3 $CH_4/m^3_{reactor}$.day, the volumetric loading 17.3 kg $COD/m^3_{reactor}$.day and the COD-reduction 55%. During the operation using the source separated organic fraction as a feedstock the mean gas production rate was 2.2 Nm^3 $CH_4/m^3_{reactor}$.day, the volumetric loading 11.4 kg $COD/m^3_{reactor}$.day and the COD-reduction 52%. The gas production process takes in 3 weeks. The final product is dewatered and further stabilized. The Humotex is free of pathogens. Low concentrations of heavy metals can only be obtained through separte collection of garbage. (AB).

344 (NEI-DK–957, pp. 1-7) **The effect of process aiders on start-up of anaerobic fluidized bed systems.** Motta Marques, D.M.L. Da (Setor de Saneamento Ambiental, Instituto de Pesquisas Hidraulicas, Porto Alegre-RS (BR)); Cayless, S.M.; Lester, J.N. Dansk Komite for Affald (DAKOFA), Copenhagen (Denmark). 1992. 278p. (CONF-9206295–: 1. International conference and exhibition on biological waste treatment, Herning (Denmark), 1-4 Jun 1992). In *Biowaste'92: Proceedings.* Order Number DE93721513. Source: OSTI; NTIS.

Sponsored by: ISWA and IAWPRC.

In order to study the start-up of anaerobic fluidized bed (AFBS) treating ice-cream factory wastewater, several start-up protocols were tested applying different aiders while the organic load was increased stepwise. These aiders were: biological preconditioning of the wastewater in a continuous flow-stirred tank reactor at constant hydraulic retention time; chemical preconditioning of the wastewater with the supplementation of $CaCl_2$, a misture of detergents (anionic and nonionic surfactants) and the addition of Coenzyme M (2-mercaptoethanesulphonic acid) during the seeding period. The protocols enchanced the AFBS start-up performance. Each start-up protocol increased the maximum efficiency of COD removal for the range of organic loading applied by comparison with the control system, although the best substrate removel efficiency was not associated with the best methane yield. (au).

345 (NEI-DK–957, pp. 1-6) **Aerobic and anaerobic treatability studies of pulp and paper industry waste waters.** Eroglu, V. (Istanbul Technical University, Faculty of Civil Eng., Environmental Engineering Dept., Maslak, Istanbul (TR)); Ozturk, I.; Sarikaya, H.Z. Dansk Komite for Affald (DAKOFA), Copenhagen (Denmark). 1992. 278p. (CONF-9206295–: 1. International conference and exhibition on biological waste treatment, Herning (Denmark), 1-4 Jun 1992). In *Biowaste'92: Proceedings.* Order Number DE93721513. Source: OSTI; NTIS.

Sponsored by: ISWA and IAWPRC.

Low COD removal efficiencies and excessive biological sludge problems associated with pulp and paper mill waste waters were addressed. Pilot and full scale experiences on aerobic biological treatment and lab-scale anaerobic treatability of waste water of an integrated pulp and paper mill were presented. Inert fraction of COD was determined using simultaneous 3-liter volume aerobic reactors fed with glucose and waste water. It was found that inert COD concentration is about 700 mg/l which is about 45 percent of initial COD. Low COD removal efficiency of the full scale plant was atributed to high inert COD content. Anaerobic treatability studies were carried out by an upflow anaerobic sludge blanket reactor (UASBR) with a volume of 10.35 liter. COD removal of 55% was achieved at UASBR operated at 33 $\pm$ 2 deg. C with detention time of 24 h. It is estimated that 70 percent of energy saving and about 65 percent reduction in excess biological sludge production is passible by applying anaerobic pretreatment to pulp and paper mill waste water. (au).

346 (NEI-DK–957, pp. 1-6) **Anaerobic pretreatment of university-hospital waste water.** Tsonis, S.P. (Environmental Technology Laboratory, Department of Civil Engineering, University of Patras, Patras (GR)). Dansk Komite for Affald (DAKOFA), Copenhagen (Denmark). 1992. 278p. (CONF-9206295–: 1. International conference and exhibition on biological waste treatment, Herning (Denmark), 1-4 Jun 1992). In *Biowaste'92: Proceedings.* Order Number DE93721513. Source: OSTI; NTIS.

Sponsored by: ISWA and IAWPRC.

Anaerobic pretreatment of the two main waste water streams from the Patras University Campus [a hospital waste water stream and the waste water from all the other activities (university waste water stream)], in four different anaerobic systems and under a variety of operational conditions, is presented in this work. The anaerobic systems studied were 3 anaerobic contact units with sludge recycle, a U-type tube digester, a longitudinal anaerobic tank and a full scale cylidrical-conical deep anaerobic tank. The waste water treated resembled domestic sewage and the anaerobic systems studied, at temperatures sewage and the anaerobic systems studied, at temperatures 7-37 deg. C and hydraulic retention times 2-72 h, effected only limited soluble organics removals (20-33% in terms of COD). (au) (13 refs.).

Sponsored by: ISWA and IAWPRC.

This presentation contains a review of rules and regulations for the deliberate release of genetically modified organisms (GMO's) into the environment. The emphasis is on the EEC directives, also exemplified in the 1991 Danish Law. The OECD has formed a working group on Biotechnology for a Clean Environment. This troup studies examples of beneficial effects of the employment of GMO's to clean up the environment from various pollutants. (au).

348 (NEI-DK–969) **Expanded measuring programme on farm biomass conversion plants.** Hinge, J. Nordvestjysk Folkecenter for Vedvarende Energi, Hurup (Denmark). Mar 1992 38p. (In Danish). Contract ENS-UVE-90.0153. Order Number DE93721410. Source: OSTI; NTIS.

Data was collected and operation results registered in connection with a number of biomass conversion plants located on farms. The data collection programme DATIND was further developed in order that it should be an efficient tool for data registration and monitoring of plants. Currently, there exist various kinds of biomass conversion plants where the technical and process operation has been documented over longer periods. Many plants are highly automated to an extent which minimizes the amount of daily work to 10-15 minutes. It is stated that for many Danish farms, especially those which hold pigs as livestock, experience economical advantage after investment in biomass conversion plants as the heating of barns for large numbers of pigs involves the necessity of producing a significant amount of heat - also because it will not be necessary to supplement the farm's pig manure biomass with light organic municipal wastes. It is recommended to concentrate on the development of low-cost bioconversion systems, for example manure slurries in storage tanks, in order to make life easier for the farmer. (AB).

Sponsored by: ISWA and IAWPRC.

This report is an investigation concerning small CHP-plants base on biomass. The project is based on application of serially produced prefurnaces for combustion of bio-mass in connection with ordinary industrial steam boilers of the fire-tube boiler type, as exactly a reduction of the price for the boiler type components is the actual idea of the project. The plant consists of two prefurnaces connected to the boiler, producing 3.2 T/h steam at 26 bar a., 380 deg. C superheating. The steam is expanded in a newly developed steam engine to vacuum at 0.66 bar a., 88 deg. C, thereby producing approx. 500 kW of electricity. The heat production-capacity is 2 MW, resulting in a power/heat ratio of approx. 25%. Economic calculations based on a budget of approximately 8.5 Million DKK and an equivalent full load timefigure of 6000 hours/year result in payback times of approx. 4.5 - 7.5 years. (au).

351 (NEI-DK–979) **IEA round robin analysis of straw and straw ashes.** Nielsen, C.; Westborg, S. (eds.). DK-Teknik, Soeborg (Denmark). Jan 1992 71p. Order Number DE93721403. Source: OSTI; NTIS.

Prepared for IEA-Biomass Conversion Task VII.

The aim was to investigate which analytical methods are used in different countries to characterize straw for energy utilization and to which extent the methods influence the result. A round-robin test for the analysis sample of a straw and sample of straw ash was completed. Laboratories from Austria, Denmark, Sweden and the United Kingdom participated. Recommendations for suitable analytical methods are given. The methods were used in relation to the determination of moisture and ash content in addition to sulphur, chlorine, carbon, hydrogen, nitrogen, lead, cadmium, copper, mercury, phosphorus, silicum, iron, aluminium, calcium, magnesium, sodium, potassium and unburned matter. The fusibility of the ash and the calorific value were also investigated. (AB).

352 **Furnace for biological fuels.** Svensson, E. 24 Jul 1992. Filed date 23 Jan 1991. Canada Patent patent application 2034773. 16p. Source: Micromedia Ltd., Technical Information Centre, 165 Hotel de Ville, Place du Portage, Phase 2, Hull, Quebec, Canada J8X 3X2. Prices: PC $6.00 CAN; MF $4.00 CAN.

A furnace for biomass fuels is provided in which the combustion is effected downwards in order allow firing down to a very low output. According to the invention, the furnace has a fuel storage vessel which also serves as a gas collection vessel and which, during operation, is pressurized to a slight atmospheric overpressure. The bottom part of the storage vessel is formed with sloping walls, the lower edges of which form a burner opening. Above this opening, a draft air supply means extends closely alongside the sloping bottom along the portions of the bottom positioned closest to the burner opening. The furnace of the invention overcomes problems of previously known furnaces for biomass fuels which have high emissions and low efficiency when the heat extraction is low. 5 figs.

Sponsored by: ISWA and IAWPRC.

The points, where relevant emissions of a composting plant are generated, can be determined from the process flow sheet. Emissions occur via the water, air and soilpaths. Critical points are the receiving area, the pre-treatment procedure, the rotting area, the post-treatment procedure and finally the compost itself. The main point, where leachates are produced, is the rotting area. The BOD_5 of the leachates reaches values up to 39000 mg O_2/l. The amount of this waste water can be reduced by using suitable techniques, such as closed systems or sheltered piles. Treatment of the wastewater is necessary in any case. The heavy metal contents in composts made from separately collected organic matter are very low. In respect to German legislation there is no problem involved in using this compost for horticultural purposes. On the basis of existing data, it can be said that the contents of organic pollutants are extremely low in these composts. Partly they can be eliminated by the rotting process. Ideally, the discharge of these substances into the environment must be avoided, where they are produced and utilized. Odour emissions, which are generated during the delivering, the treatment and the rotting processes can be avoided by using closed facilities and exhaust air collection systems as well as by purification of this exhaust air, e.g. in biofilters. At the moment it is difficult to calculate the odour emissions from open piles, because the methods for doing so have yet to be developed. By using a qualified rotting system, the emissions can be reduced to an acceptable level. (au).

356 (NEI-DK–957, pp. 1-3) **Differences in nitrogen fertilizing effect from anaerobically digested and untreated cattle slurry.** Oertenblad, H. (The Danish Agricultural Advisory Centre, Aarhus (DK)). Dansk Komite for Affald (DAKOFA), Copenhagen (Denmark). 1992. 278p. (CONF-9206295–: 1. International conference and exhibition on biological waste treatment, Herning (Denmark), 1-4 Jun 1992). In *Biowaste'92: Proceedings.* Order Number DE93721513. Source: OSTI; NTIS.

Sponsored by: ISWA and IAWPRC.

For three years field experiments have been conducted to find out if there is any difference in the nitrogen fertilizing effect of anaerobic digested and untreated cattle slurry. The experiments were made in spring barley and showed an average N-efficiency of 64 per cent from applied anaerobic digested slurry and 50 per cent from applied untreated slurry. The N-efficiency is defined as the amount of nitrogen in mineral fertilizer which 100 kg of total-nitrogen inslurry can replace. The difference in N-efficiency can be explained by mesurements of soil mineral nitrogen and losses by denitrification. Soil mineral nitrogen measurements showed losses of 10-15 per cent of the ammonia content in the digested slurry and of 25 per cent in the untreated slurry (compared to mineral fertilizer). The digestion of the slurry resulted in a 75 per cent decrease in losses by denitrification corresponding to 15 kg N/ha. (au).

10 SYNTHETIC FUELS

1002 Production

357 (NEDO-P–9114) **Survey of alcohol production technology using coalbed methane as raw material.** New Energy and Industrial Technology Development Organization, Tokyo (Japan). Mar 1992. 156p. (In Japanese). Sponsored by New Energy and Industrial Technology Development Organization, Tokyo (Japan). Order Number DE93723966. Source: OSTI; NTIS.

This paper reviews properties, geological conditions and scales of coalbed methane and makes a feasibility study in case of using it as a raw material of fuel use alcohol. Since coalbed methane exists in a wide area, an organized pipeline network over a large area is needed to use it. The feasibility study is conducted in the following case: Coalbed methane as raw material, which is supposed to be produced in Australia, is transported by pipeline to the seashore. Using the system combining a synthetic gas production process by the two step combined reforming method and a synthetic method by the gas phase fluidized bed, fuel methanol is produced in a scale of 5000 tons/day and transported to Japan by a private tanker. As a result, proposals are made for the taxation system, development of the otto type engine and establishment of fuel alcohol production technology. 116 refs., 40 figs., 24 tabs.

13 HYDRO ENERGY

358 (KTM/E-B–112) **Potential of hydro power and its utilization possibilities.** Kovanen, T. (ed.). Ministry of Trade and Industry, Helsinki (Finland). 1992. 47p. (In Finnish). Project KTM-148/881/90. Order Number DE93721595. Source: OSTI; NTIS.

The total amount of small scale (no more than 1 MW) hydro power was estimated to be 370 MW (calculated with the mean discharge) of which almost 50 MW is already utilized. About 150 MW of underdeveloped small scale hydro power is not protected by law. It is estimated that rather easily about 60 MW could be developed with installed capacity of 80 MW (0.35 TWh/a). Undeveloped hydro power with capacity of more than 1 MW amounts to 770 MW. Of the total amount 400 MW lies in protected rivers or rapids. Main part of the unprotected capacity lies in rivers which serve as boundaries and only 50 MW lies elsewhere. The installed capacity of this 50 MW could be about 85-125 MW (0.25 TWh/a). The Vuotos reservoir would give installed capacity of 35 MW (0.36 TWh/a). The most important hydro power projects which are to-day prohibited by the protection laws were in Ounasjoki river, in middle and upstream parts of Iijoki river and in downstream part of Kymijoki river. The total installed capacity would have been 640 MW (2 TWh/a). New capacity may be obtained also with repairing existing plants or with adding new turbines. The total additional capacity could be 114 MW (0.20 TWh/a). The additional turbines in Kemijoki river could give 250 MW (0.11 TWh/a). About 12.6 TWh/a (2800 MW) of hydro power potential in Finland has been developed already. The capacity which could still be developed is 3.4 TWh/a (installed capacity about 1100 MW). The figures include repairing of existing power plants. Without the rivers flowing along the borders

of the country only 1.4 TWh/a (about 560 MW as installed capacity) could be developed. The amount of hydro power in protected rivers or rapids is 3.7 TWh/a (as installed capacity 900 MW).

359 (KTM/E-B–113) **Small-scale hydro power and its development possibilities.** Oksanen, S. (ed.). Ministry of Trade and Industry, Helsinki (Finland). 1992. 57p. (In Finnish). Project KTM-148/881/90. Order Number DE93721596. Source: OSTI; NTIS.

The small scale hydro power potential in Finland in the range of 50-1000 kW is estimated to be about 151 MW (calculated with the mean discharge). The potential lies in 861 rivers or rapids not protected by any Finnish law. The corresponding energy potential is about 0,9-1,3 TWh/a. It is estimated that about 60 MW lies in locations with existing dams or power plants out of service. The installed capacity in these locations could be about 80 MW and average annual production capacity 0.35 TWh. The operating environment for small scale hydro developers has changed. The cost survey of small scale hydro plants established during the 1980's indicates that new, simplified and cost efficient technological solutions have reduced the investment costs in real terms. There are only a few domestic plant/turbine manufacturers in Finland but their product ranges together cover most of the typical turbine types applicable at the Finnish low head hydro sites. The trend has been towards the standard tubular turbines (both Kaplan and Semi-Kaplan), compact propeller turbines with asynchronous generators, more careful landscaping, low buildings or hidden construction, and advanced electrical and control equipment. The study also deals with the institutional and other barriers of small scale hydro power construction, and gives recommendations for facilitating small hydro projects. Guidebooks and standardized application forms are recommended for easier construction permit application procedure. The role of electricity distribution utilities in exploiting the small scale hydro potential in Finland is emphasized.

360 (LBL–32063) **San Joaquin-Tulare Conjunctive Use Model: Detailed model description.** Quinn, N.W.T. Lawrence Berkeley Lab., CA (United States). Mar 1992. 254p. Sponsored by Department of the Interior, Washington, DC (United States). DOE Contract AC03-76SF00098. Order Number DE93001536. Source: OSTI; NTIS; GPO Dep.

The San Joaquin - Tulare Conjunctive Use Model (SANTUCM) was originally developed for the San Joaquin Valley Drainage Program to evaluate possible scenarios for long-term management of drainage and drainage - related problems in the western San Joaquin Valley of California. A unique aspect of this model is its coupling of a surface water delivery and reservoir operations model with a regional groundwater model. The model also performs salinity balances along the tributaries and along the main stem of the San Joaquin River to allow assessment of compliance with State Water Resources Control Board water quality objectives for the San Joaquin River. This document is a detailed description of the various subroutines, variables and parameters used in the model.

361 (OY/PSTL-TIED–81) **The labour effects and other effects of the Vuotos reservoir on rural economy.** Kaihua, V.M. Oulu Univ. (Finland). Research Inst. of Northern Finland. 1992. 79p. (In Finnish). Order Number DE93721626. Source: OSTI; NTIS; INIS.

The labour and the other occupational effects of construction of the Vuotos reservoir in the surroundings of it and in the rural area of Lappland have been estimated in this publication. The Vuotos reservoir would be constructed in the Kemijoki. The reservoir would be sited mainly in the commune of Pelkosenniemi, but parts of it would also be in the communes of Salla and Savukoski. The communes of Sodankylae and Kemijaervi would belong to the nearby region. The need for labour has been estimated on the basis of models based on technical data and the amount of work needed, cost-benefit models and on the basis of the portions of cost estimates and wages. The additional effects have been estimated on the basis of studies made for the previous corresponding tasks. The clearing work, and both the soil and water works construction would case most work opportunities, the total labour need being 1700 to 2500 man-years. The large variation is caused by the fact that the requirements of the court of water on e.g. clearing are not known, and not how the work will be organized. About 15 % more people would be employed in the surrounding communities and about 30 % more in the rural area of Lappland via additional effects, than the actual employment effect would be. 40 to 65 sustainable working places would become into fishing, energy production and tourism, and 21 to 32 working places would be lost in agriculture, reindeer husbandry and forestry. The portion of the industry of the nearby region of the total contractive works would be 80-100 million FIM and that of the rural area of Lappland 150-180 million FIM. The gross income in the rural area of Lappland would be 190-230 million FIM, and those of the nearby communes 100-140 million FIM. Additionally, delivery of goods and compensations for real estates remaining under water would bring income.

1307 Power-Conversion Systems

362 **Power generating apparatus for converting a potential energy to a power output.** Liao, KuoChen; Chen, Mei C. 29 Jun 1992. Filed date 28 Dec 1990. Canada Patent patent application 2033402. 19p. Source: Micromedia Ltd., Technical Information Centre, 165 Hotel de Ville, Place du Portage, Phase 2, Hull, Quebec, Canada J8X 3X2. Prices: PC $6.00 CAN; MF $4.00 CAN.

An apparatus for converting the potential energy of a reservoir into a power output includes a pair of cylinders, each having a piston and a piston rod. The piston rods are coupled to two axles of a crank. Each cylinder has an inlet pipe to the reservoir. An inlet valve is coupled to each inlet pipe in order to control the flow of water. When the inlet valve is opened, water from the reservoir may flow into the cylinder in order to push the piston so that the crank is driven to rotate and generate a power output by the crank. 5 figs., 1 tab.

363 **System for hydraulically generating mechanical energy.** Tremblay, J. 12 Jun 1992. Filed date 11 Dec 1990. Canada Patent patent application 2031989. 29p. Source: Micromedia Ltd., Technical Information Centre, 165 Hotel de Ville, Place du Portage, Phase 2, Hull, Quebec, Canada J8X 3X2. Prices: PC $6.00 CAN; MF $4.00 CAN.

A system for hydraulically generating mechanical energy comprises a chain device, a pair of rotatable wheels, and a reservoir containing liquid. The chain device defines a closed loop and comprises a series of spherical balls spaced apart from each other by a constant distance. The wheels each define a rim surface on which the chain device is mounted in order to enable longitudinal movement of the chain and to guide the same as it moves longitudinally. These wheels have the same diameter, lie in a first common vertical plane, and rotate about respective rotation axes both lying in a second vertical plane perpendicular to the first one. The reservoir opens through a vertical tubular member whose length is longer than the spacing between the balls on the chain device. The chain device includes a vertical section extending into the reservoir and the tubular member. In operation, the liquid in the reservoir produces by gravity a pressure on the balls when situated in the tubular member to cause longitudinal movement of the chain device and rotation of the wheels, thereby generating mechanical energy. In one embodiment, a number of reservoirs and chain devices are used to generate power from tides. 4 figs.

In establishing basic criteria for the 'monitoring for safety' of large dams, i.e., structures more than 10 m high, or retaining more than 100,000 cubic meters of water (currently, there are 16,000 world-wide), this paper focusses on three fundamental steps: the frequent monitoring, with permanent sensors installed in the dam, of key quantities, e.g., displacements, strains, seepage, etc., characterizing the structural response of the dam to changing environmental actions; simultaneous monitoring of quantities such as water level, water and air temperatures, facing or internal temperatures, etc.; real time evaluation of the 'acceptability' of the response of the dam. In illustrating how these monitoring steps are carried out, the author draws on his own experience within the framework of ENEL (Italian National Electricity Board) activities.

Czechoslovak Solar Energy (Czechoslovakia); Ceske Vysoke Uceni Technicke, Prague (Czechoslovakia). 1991. 100p. (CONF-9107237–: Renewable energy sources '91 international conference, Prague (Czechoslovakia), 1 Jul 1991). In *Renewable energy sources '91. Part 3: Conference report, post-deadline papers.* Order Number DE93605594. Source: OSTI; NTIS (US Sales Only); INIS.

The paper is based on a survey performed by the Energy Research Council. The survey included the performance of 15 diesel pumps, 5 solar pumps and 10 wind pumps. The performance of the different types of pumps is discussed. The results of an economic analysis of water pumping have shown that renewable energy has a potential for replacing diesel fuel in locations where solar radiation exceeds 22 MJm^{-2}/day, or where the mean wind speed exceeds 4.8 ms^{-1}. Selected projects Neste Advanced Power Systems (NAPS).

Finland, due to its seasonal variation in climate has given Neste Advanced Power Systems (NAPS) invaluable experience in promoting, designing and operating alternative energy systems. A selection of these systems is presented in the text. The variety in applications range from largest photovoltaic plant in Nordic countries located in Southern Finland, to small photovoltaic systems in Northern Lapland. Some selected projects are presented.

Neste Advanced Power Systems (NAPS) is a renewable energy systems company supplying complete power systems based on photovoltaics, wind turbine generator, diesel generators, or hybrid systems combining two or more of these. Except for a few demonstration systems linked to the electricity grid, these are stand-alone power supplies which include storage batteries. Our present market areas are: Domestic systems for remote houses, largely in the Nordic countries. Systems for developing countries, mostly for lighting, health care and water supply and industrial and professional systems for use anywhere in the world, mainly for telecommunications and navigation aids.

368 (CONF-9205243–) **Sixteenth DOE Solar Photochemistry Research Conference: Proceedings.** Argonne National Lab., IL (United States). [1992]. 246p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. From 16. DOE solar photochemistry research conference; Delavan, WI (United States); 31 May - 4 jun 1992. Order Number DE93001760. Source: OSTI; NTIS; GPO Dep.

The conference brings together contractors and grantees engaged in research on photochemical energy conversion to foster cooperation, collaboration, and exchange of current research ideas. The meeting provides an opportunity for cross-fertilization and synergistic interaction among investigators who share common long-range goals of producing low-cost fuels and chemicals or electricity by photochemical conversion of solar energy. The program this year encompassed the topical areas of transition metal photochemistry and photophysics, electron transfer, photosynthesis, photoelectrochemistry, organic photochemistry, and photoredox chemistry in heterogeneous environments. This volume contains the agenda for the meeting, abstracts of 30 formal presentations and 54 posters, a record of question/answer discussions, as well as the participant list and an author index. 369 (EUR–13897) **European solar test installation (ESTI). Qualification test procedures for crystalline silicon photovoltaic modules.** Ossenbrink, H. (Commission of the European Communities, Ispra (Italy). Joint Research Centre); Rossi, E. Commission of the European Communities, Luxembourg (Luxembourg). 1992. 39p. Source: OSTI; NTIS (US Sales Only).

This recommendation lays down the control tests applied by the Joint Research Centre for the qualification of crystalline silicon photovoltaic (PV) modules. The general objective of these tests is to asses relative performances and to identify environmental factors and design features which could affect the attainment of a sufficiently long life-time. This document is issued for the purpose of updating previous specifications. Performance and qualification tests have been revised in order to adjust for terrestrial PV module technology developments and to take into account a growing body of knowledge from experience in the field.

370 (NEI-DK–950) **Solar cell technology in Denmark: Photovoltaic technology in Denmark. Status, and draft for a plan of management.** PA Energy A/S, Malling (Denmark). Apr 1992 63p. (In Danish). Contract ENS-51181-91.0070. Order Number DE93721437. Source: OSTI; NTIS.

Solar cell, or photovoltaic technology is an attractive energy technology where part of the energy content of solar light is directly converted to electricity without the use of moveable parts, and where hardly any maintenance is required. An investigation was made of the present Danish status in this field, and it was found that the technology is fairly advanced but a general ignorance of this fact combined with previously high prices have limited further development. Latterly, prices have dropped. The technology, it was found, has a long service-life (<20 yrs.) and does not constitute an environmental hazard. The source of this energy has limitations related to source non-availability at night and in cloudy weather but various uses have been found for solar cells and these are expected to increase. Danish producers of this technology, consultants and information centers exist, and these are concerned mostly with exports and developing countries. It is currently difficult to find Danish data which could be used as a basis for evaluation of Danish solar cell technology. At the moment, it is claimed, there does not seem to be a basis for instigating a plan of management for the systematic promotion of photovoltaic conversion in Denmark. It is recommended that Danish actors participate in international cooperation regarding technological research in this field and more well documented national demonstration projects should

be carried out. This could be followed by a phase of systematic introduction and promotion of photovoltaic conversion in Danish energy supply. (AB) (50 refs.).

371 (NEI-DK–955) **Photovoltaics.** Kainberger, R. Nordvestjysk Folkecenter for Vedvarende Energi, Hurup (Denmark). Jun 1992 77p. Order Number DE93721382. Source: OSTI; NTIS.

The principles of photovoltaic conversion and the design and components of solar cells are described. Much attention is given to batteries in this connection. The planning and dimensioning of photovoltaic systems is explained and the use of photovoltaic systems in connection with solar water pumping is dealt with. Technological aspects are described in detail. Results of measurements on a water pump driven by photovoltaic energy are given. (AB).

372 (NREL/TP–451-5094) **Polycrystalline thin film materials and devices: Annual subcontract report, 16 January 1991–15 January 1992.** Baron, B.N. (Delaware Univ., Newark, DE (United States). Inst. of Energy Conversion); Birkmire, R.W.; Phillips, J.E.; Shafarman, W.N.; Hegedus, S.S.; McCandless, B.E. National Renewable Energy Lab., Golden, CO (United States); Delaware Univ., Newark, DE (United States). Inst. of Energy Conversion. Oct 1992. 107p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-83CH10093. Order Number DE93000022. Source: OSTI; NTIS; GPO Dep.

Results of Phase II of a research program on polycrystalline thin film heterojunction solar cells are presented. Relations between processing, materials properties and device performance were studied. The analysis of these solar cells explains how minority carrier recombination at the interface and at grain boundaries can be reduced by doping of windows and absorber layers, such as in high efficiency CdTe and $CuInSe_2$ based solar cells. The additional geometric dimension introduced by the polycrystallinity must be taken into consideration. The solar cells are limited by the diode current, caused by recombination in the space charge region. J-V characteristics of $CuInSe_2$/(CdZn)S cells were analyzed. Current-voltage and spectral response measurements were also made on high efficiency CdTe/CdS thin film solar cells prepared by vacuum evaporation. Cu-In bilayers were reacted with Se and H_2Se gas to form $CuInSe_2$ films; the reaction pathways and the precursor were studied. Several approaches to fabrication of these thin film solar cells in a superstrate configuration were explored. A self-consistent picture of the effects of processing on the evolution of CdTe cells was developed.

373 (OUP–92-17) **Hydrogen production from solar energy: A review of photolysis.** Bergene, T. Oslo Univ. (Norway). Fysisk Inst. Jun 1992. 25p. Order Number DE93721642. Source: OSTI; NTIS.

Direct splitting of water into hydrogen and oxygen by ordinary sunlight seems impossible because water is transparent to sunlight in the visible region. However, splitting is known to occur when a semiconductor act as a catalyst in the meaning that it transfers energy from the photons absorbed by it to an electrolyte, a process referred to as photolysis. In this review, the physical principles of photolysis, using semiconducting electrodes as catalysts, are summarized. An analysis of efficiencies is given, and some efficiency-determining parameters are analyzed. In addition, the mechanisms of charge-transfer between the semiconductor and the electrolyte are reviewed. Some paths for future research, both experimental and theoretical are outlined. 22 refs., 3 figs.

The activity promoted by the European Communities, aimed at demonstrating the feasibility of supplying both active and passive power distribution networks by means of photovoltaic plants (PV) has been highly successful. The PV plants at Aghia Roumeli, Pellworm, Rondulinu, and Vulcano are stand-alone plants that can supply small isolated communities. The plant at Kytnos supplies power to the grid with the help of electrochemical storage; the plants at Pellworm, and Vulcano can also supply power to the grid, the first with e.c. storage and the second without such storage. This paper gives an overview of the activity promoted by the Communities EEC-DGXII research group aimed at demonstrating the feasibility of supplying both active and passive power distribution networks by means of PV plants. Possible improvements of the power conditioning sub-system are presented.

375 (EUR–14038) **Photovoltaic demonstration projects.** Kaut, W. (Commission of the European Communities, Brussels (Belgium)); Gillett, W.B.; Hacker, R.J. Commission of the European Communities, Luxembourg (Luxembourg). 1991. 220p. Source: OSTI; NTIS (US Sales Only).

This publication, comprising the proceedings of the fifth contractor's meeting organized by the Commission of the European Communities, Directorate-General for Energy, provides an overview of the photovoltaic demonstration projects which have been supported in the framework of the energy demonstration programme since 1983. It includes reports by each of the contractors who submitted proposals in 1987 and 1988, describing progress within their projects. Projects accepted from earlier calls for proposals and not yet completed were reviewed by a rapporteur and are discussed in the summary section. The results of the performance monitoring of all projects and the lessons drawn from the practical experience of the projects are also presented in the summaries and conclusions. Contractors whose projects were submitted in 1989 were also present at the meeting and contributed to the reported discussions. This proceeding is divided into four sessions (General, Housing, technical presentations, other applications) and 24 papers are offered.

376 (NEI-DK–978) **Description and testing of photovoltaic refrigerator for vaccine storage and icepack freezing.** Gydesen, A.; Schjaer-Jacobsen, J. Danmarks Tekniske Hoejskole, Lyngby (Denmark). Fysisk Lab. 3. May 1992 142p. Order Number DE93721450. Source: OSTI; NTIS.

The purpose of the project is the design, building and testing of a photovoltaic-powered refrigerator. The refrigerator is intended for vaccine storage and ice-pack freezing and is designed to comply with specifications from the World Health Organization (WHO). In order to reduce the required size of the battery and solar panels, and at the same time accomplish a long expected battery life, some unique features are included. The system employs an ice storage that replaces part of the traditional battery storage; the energy consumption is kept low; temperature control and battery charging are handled by a microprocessor, following a strategy that as far as possible avoids discharging the battery; an electrical heater is used (on rare occasions) to keep the vaccine compartment temperature above the lower limit. Three prototypes have been built and tested. The test results show that the system functions as intended, using a relatively small solar panel and one relatively small maintenance free battery. It easily maintains the vaccine temperature within the required range and freezes 2 kg ice per day at a reasonable solar radiation. The battery is virtually not discharged. Some problems were encountered during the test period, such as a burnt-out transistor in one of the controllers, a bad thermistor temperature sensor and a loose connection in one of the refrigerators, and various malfunctions of the data logging equipmet. However, the problems concerning refrigerators are considered to be easily avoidable in mass-produced equipment. (Author) (13 refs.).

(Pacific Northwest Lab., Richland, WA (United States)); Welty, J.R. Pacific Northwest Lab., Richland, WA (United States). Aug 1992. 22p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (CONF-920804–26: American Society of Mechanical Engineers national heat transfer conference and exposition, San

Diego, CA (United States), 9-12 Aug 1992). Order Number DE93001301. Source: OSTI; NTIS; GPO Dep.

Radiation heat transfer in an array of fixed discrete surfaces is an important problem that is particularly difficult to analyze because of the nonhomogeneous and anisotropic optical properties involved. This article presents an efficient Monte Carlo method for evaluating radiation heat transfer in arrays of fixed discrete surfaces. This Monte Carlo model has been optimized to take advantage of the regular arrangement of surfaces often encountered in these arrays. Monte Carlo model predictions have been compared with analytical and experimental results.

378 (SAND–92-1031C) **An overview of current activities at the National Solar Thermal Test Facility.** Cameron, C.P.; Klimas, P.C. Sandia National Labs., Albuquerque, NM (United States). [1992]. 13p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. (CONF-920938–1: 6. international symposium on solar thermal concentrating technologies, Mojacar (Spain), 28 Sep - 2 oct 1992). Order Number DE92041160. Source: OSTI; NTIS; GPO Dep.

This paper is a description of the United States Department of Energy's National Solar Thermal Test Facility, highlighting current test programs. In the central receiver area, research underway supports commercialization of molten nitrate salt technology, including receivers, thermal energy transport, and corrosion experiments. Concentrator research includes large-area, glass-metal heliostats and stretched-membrane heliostats and dishes. Test activities in support of dish-Stirling systems with reflux receivers are described. Research on parabolic troughs includes characterization of several receiver configurations. Other test facility activities include solar detoxification experiments, design assistance testing of commercially-available solar hardware, and non-DOE-funded work, including thermal exposure tests and. testing of volumetric and PV central receiver concepts.

Computer models have been developed to describe the operation of both solar updraft and evaporative downdraft chimneys. Design studies are being conducted at the present time to use the towers for cooling an experimental, well instrumented, structure to study passive cooling in residential buildings. (MHR)

380 (DOE/CH/10205–T3) **Establish feasibility for providing passive cooling with solar updraft and evaporative downdraft chimneys: Final report, June 15, 1984–December 31, 1987.** Cunningham, W.A.; Mignon, G.V.; Thompson, T.L. Arizona Univ., Tucson, AZ (United States). Environmental Research Lab. [1987]. 112p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-84CH10205. Order Number DE93001745. Source: OSTI; NTIS; GPO Dep.

Natural draft towers can be used for cooling and ventilating structures. From an operational perspective, the downdraft evaporatively cooled tower is preferred for a dry climate. Solar chimneys, when used alone, tend to require an excessively large solar collector area when appreciable quantities of air must be moved. When used in combination with a downdraft tower, the roof and attic of buildings may assist the solar chimney and their use becomes more attractive. Both a frame building and a greenhouse were successfully cooled during this program. The economics of the downdraft tower compare favorably with conventional evaporative cooling for some application.

381 (DOE/CH/10205–T5) **Establishing feasibility for providing passive cooling with solar updraft and evaporative downdraft chimneys: Progress report, October 1985–February 1986.** Cunningham, W.A.; Mignon, G.V. Arizona Univ., Tucson, AZ (United States). [1986]. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-84CH10205. Order Number DE93003062. Source: OSTI; NTIS; GPO Dep.

At the present time all experimental towers (chimneys) are completed and operating. This consists of both a solar updraft and a natural-evaporative downdraft tower retrofitted to an existing residence structure and a greenhouse. The residential, experimental, natural-draft cooling system was completed in May, 1985, and five months of summer data on a Hewlet Packard 85 data acquisition computer with a digital voltmeter were acquired. The cooling tower and solar chimney on the experimental greenhouse became operational in September of 1985. A conceptual drawing of both the greenhouse and the residence natural-draft towers is included in the appendix along with the September 85 progress report.

382 (DOE/CH/10205–T6) **Establishing feasibility for providing passive cooling with solar updraft and evaporative downdraft chimneys: Progress report, March 1985–September 1985.** Cunningham, W.A.; Migon, G.V. Arizona Univ., Tucson, AZ (United States). [1985]. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-84CH10205. Order Number DE93003063. Source: OSTI; NTIS; GPO Dep.

The solar updraft and a natural evaporative downdraft tower built onto an existing residence structure and a greenhouse were completed and operating. Performance data for the hottest days of June, July, and August, 1985 are included. (MHR)

383 (NEI-DK–952) **Environmental and energy analysis of the plus energy house: Project using tsbi3 dynamic simulation program.** Janak, M. Nordvestjysk Folkecenter for Vedvarende Energi, Hurup (Denmark). Jun 1992 30p. Contract SE/00280/89/DK. Order Number DE93721384. Source: OSTI; NTIS.

The building investigated was to be used for offices combined with a large greenhouse. The building was to be used as a source of heat production with sale of surplus energy, the aim was to save on energy consumption in the greenhouse and to save on the cost of living in the house by using a climate shield. The construction of the building is described and illustrated with diagrams. A daylighting analysis was carried out using the OSV1 computer programme developed at the Slovak Technical University. The environmental and energy analysis were carried out using the tsbi3 dynamic simulation programme. Here the aim was to design the heating and dehumidification system, suggest the operation mode for a beadwall system and check comfort conditions. The passive solar features, and heating and cooling systems are described and the results of the energy and environmental analysis are presented. It was concluded that the beadwall system gave rise to direct passive solar energy gains together with its shading, ventilation and dehumidification/cooling system. (AB).

384 (DOE/SF/16345–5) **Open-cycle absorption solar cooling: Natural convection heat and mass transfer from falling films in vertical channels: Final report.** Buck, G.A.; Wood, B.D. Arizona State Univ., Tempe, AZ (United States). Jun 1992. 315p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG03-86SF16345. Order Number DE92040999. Source: OSTI; NTIS; GPO Dep.

In the design of solar collector/regenerators for use in open cycle absorption refrigeration (OCAR) units, the problem of predicting evaporation mtes and solution temperatures is of paramount importance in determining overall cycle performance. The governing equations for natural convection flow in a vertical channel bounded by a heated falling film (simulating a glazed collector/regenerator) were solved using several different finite difference techniques. The numerical results were validated against existing experimental and numerical results for simplified boundary conditions. The appropriate nondimensionalization for the falling film boundary condition was established, ostensibly for the first time, and a parametric study for an air-water vapor mixture has been presented. Curve fits to the numerical results were determined for engineering design applications. To further confirm the validity of the numerical solutions,

an experimental apparatus was constructed using electric resistance heat to simulate the constant heat flux of the solar source. Water was introduced at the top of this heated vertical surface at various flow rates and under various supplied heat fluxes, and a natural convection channel flow generated between the heated falling film and a parallel, plexiglas surface. Film temperatures and moist air velocity profiles were measured at various streamwise (vertical) locations for comparison with the numerical results.

385 (EUR–13469) **Iso solar thermal standards studies to improve technical and scientific information for the finalization of performance test procedures.** Gilliaert, D. (Commission of the European Communities, Ispra (Italy). Joint Research Centre); Tebaldi, P.; Morrison, G. Commission of the European Communities, Luxembourg (Luxembourg). 1992. 90p. Source: OSTI; NTIS (US Sales Only).

During a Visiting Scientist programme in 1990 at the Joint Research Centre, work was carried out to develop documentation and technical support on solar collector and solar water heater test methods for submission to the International Standards Organisation (ISO). Investigations covered the measurement of long wave atmospheric radiation for unglazed solar collector characterization, thermal performance test procedures for unglazed solar collectors, and outdoor testing to determine the effects of load pattern and auxiliary boosting.

386 (EUR–13907) **Estimation of the corrosion risk of solar collectors. A five-year weathering experiment in industrial and rural areas.** Bauch, R. (Commission of the European Communities, Ispra (Italy). Joint Research Centre); Brovelli, M.; Laghi, F.; Weisgerber, P. Commission of the European Communities, Luxembourg (Luxembourg). 1992. 56p. Source: OSTI; NTIS (US Sales Only).

The weathering experiment, with five solar collector models from different manufacturers, chosen for their various construction materials, and arranged in two identically equipped test fields operating under simulated working conditions, at one site with industrial and one with rural environment, was concluded in 1988. The environmental variables which are significant for thermal charge of the collectors such as solar irradiance and for the corrosion risk such as relative air humidity and gaseous sulfur dioxide concentrations were measured and recorded during the last two and a half years of the weathering experiment. Air Suspended particulate matter extracted during that time from the sample air stream by dust filters was also analyzed and the mean concentrations of particulate bound sulfur estimated. The evaluation of these data revealed, that the average values of the concentration of gaseous sulfur dioxide at the industrial site were higher than those of the rural site by a factor of about 1.7. The same ratio between those two sites was also found for the average values of the concentration of sulfur bound to air suspended particulate matter. Greater corrosion effects were indeed observed on the industrial site, but they were not severe enough for as to expect serious damages on prolonged exposure. Comparing the corrosion effects with those obtained from the usual 'moist SO_2 tests' confirmed our initial suspicion, that the latter are much too aggressive for predictions of resistance against atmospheric corrosion, with the exception of collector installations in some rather rare situations of great corrosion risk. 9 refs., 5 figs., 5 tabs., 5 annexes.

387 (SAND–92-7001) **Development of a commercial photovoltaic concentrator module.** Saifee, S.T. (Solar Kinetics, Inc., Dallas, TX (United States)); Hutchison, G. Sandia National Labs., Albuquerque, NM (United States); Solar Kinetics, Inc., Dallas, TX (United States). Sep 1992. 73p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. Order Number DE93002594. Source: OSTI; NTIS; GPO Dep.

The ojective of this work was to develop the design and prototype of a commercial high-concentration photovoltaic (PV) module. The design is for a 282-sun point-focus concentrating module. Most of the components, subassemblies, and design features incorporate simplifications and ease of manufacturing. The Solar Kinetics, Inc. (SKI) module is designed to incorporate high-efficiency, single-crystal silicon PV cells. The housing is made with aluminum laminated for voltage stand-off and simultaneously providing high thermal conductivity. The Fresnel lens injection molded by American Optical (AO) as singles. The cell assembly consists of a copper heat spreader, a photovoltaic cell soldered, a top and bottom contact, and a reflective secondary optical element (SOE). The cell assemblies passed all of the initial electrical characterization and high-potential tests. Under environmental cycling, the only bond that failed was the PV cell-to-heat spreader interface. The other components (top contact, bottom contact, SOE) passed all the environmental cycling tests. The cell assemblies were designed to be mounted onto the receiver section with a thermally conductive RTV. This geometry was subjected to environmental testing. There was no delamination of this bond nor was there electrical breakdown when the assemblies were subjected to the hi-pot test. A mock module was fabricated for environmental evaluation. This module was subjected to the humidity/freeze cycling to assess the performance of the lens mounting design. This module was also subjected to the rain test after the humidity/freeze cycling and checked for water leaks. The lens showed small displacement from its original position after the environmental cycling. One tablespoon of water did collect inside the module.

388 (SAND–92-7009) **Wind load design methods for ground-based heliostats and parabolic dish collectors.** Peterka, J.A. (Colorado State Univ., Fort Collins, CO (United States). Fluid Dynamics and Diffusion Lab.); Derickson, R.G. Sandia National Labs., Albuquerque, NM (United States). Sep 1992. 80p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. Order Number DE93002737. Source: OSTI; NTIS; GPO Dep.

The purpose of this design method is to define wind loads on flat heliostat and parabolic dish collectors in a simplified form. Wind loads are defined for both mean and peak loads accounting for the protective influence of upwind collectors, wind protective fences, or other wind-blockage elements. The method used to define wind loads was to generalize wind load data obtained during tests on model collectors, heliostats or parabolic dishes, placed in a modeled atmospheric wind in a boundary-layer wind-tunnel at Colorado State University. For both heliostats and parabolic dishes, loads are reported for solitary collectors and for collectors as elements of a field. All collectors were solid with negligible porosity; thus the effects of porosity in the collectors is not addressed.

389 **Ambient radiant energy concentrator.** Horsley, P.B. 4 Jul 1992. Filed date 3 Jan 1991. Canada Patent patent application 2033526. 7p. Source: Micromedia Ltd., Technical Information Centre, 165 Hotel de Ville, Place du Portage, Phase 2, Hull, Quebec, Canada J8X 3X2. Prices: PC $6.00 CAN; MF $4.00 CAN.

In a solar energy concentrator that can accept radiant energy from all directions, an elongated plane mirror faces directly towards the center of the bowl of an elongated mirror that in section has a parabolic profile. With these two components, the incoming radial converging pattern of rays is changed into a new pattern in which all of the rays are turned parallel and concentrated together. The concentration of parallel rays then enters a narrow slot in the center of the parabolic mirror or in the center of the plane mirror where the radiant energy impinges on a thermal element. The heated element is a blackened metal tube containing a circulatory fluid. The heated thermal element has a cylindrical jacket with a mirrored interior surface to reflect back and prevent the escape of collected energy. A small slot in the jacket permits the narrow beam of concentrated radiant energy to enter and impinge on the blackened thermal element. The temperature of the heated element is elevated sufficiently by the radiation concentrator to boil the enclosed fluid. The pressurized vapor from the fluid is then directed through a turbine to generate electric power, or is used for heating. Four of the radiant energy concentrators can be supported in a tower arrangement to collect radiation from all directions. 5 figs.

390 (EUR–13518) **Guidelines for the technical follow-up of solar thermal plants.** Colombo, R. (Commission of the European Communities, Ispra (Italy). Joint Research Centre); Gilliaert, D.; Landabaso, A. Commission of the European Communities, Luxembourg (Luxembourg). 1992. 59p. Source: OSTI; NTIS (US Sales Only).

This document describes the various ways in which contractors of the CEC DG XVII solar thermal demonstration projects should provide technical information to the Commission. The four major communications channels are SESAME data sheets, interim technical reports, final technical reports and technical visits, the requirements for each of which are explained in detail.

15 GEOTHERMAL ENERGY

391 (CONF-920378–, pp. 187-190) **Technology transfer, reaching the market for geopressured-geothermal resources.** Negus-de Wys, J. (Idaho National Engineering Lab., Idaho Falls (United States)). USDOE Assistant Secretary for Conservation and Renewable Energy, Washington, DC (United States). Geothermal Div. [1992]. DOE Contract AC07-76ID01570. From Geothermal energy program review: geothermal energy and the utility market–the opportunities and challenges for expanding geothermal energy in a competitive supply market; San Francisco, CA (United States); 24-26 Mar 1992. In *Geothermal energy and the utility market – the opportunities and challenges for expanding geothermal energy in a competitive supply market: Proceedings. Geothermal Program Review X.* 230p. Order Number DE92019090. Source: OSTI; NTIS.

Technology transfer to the industrial sector for geopressured-geothermal technology has included diverse strategies, with successes and obstacles or roadblocks. Strategy categories include the following: feasibility studies and reports, consortium activities and proceedings, the Geothermal Resource Council, national and international meetings of the American Association of Petroleum Geologists, other societal and organizational meetings and conferences, Department of Energy solicitation of interest in the commerce Business Daily, industry peer review panels, and the Secretary's Technology Initiative. All of the above strategies contribute to technology transfer and are needed in some combination for the desired success. The most successful strategy activities for bringing in the interest of the largest number of industries and the independents are the consortium meetings, one-on-one telephone calling, and consortium proceedings with information service followup. The most successful strategy activities for bringing in the interest and participation of majors are national and international peer reviewed papers at internationally recognized industry-related society meetings, and on-call presentations to specific companies. The numerical results of the activities reflecting four years of technology transfer following the 15 year lead in the early phases of the geopressured-geothermal program under the leadership of Dr. Myron Dorfman, reflect a dynamic surveying of what works in technology transfer with industry in the area of geopressured-geothermal resources. The identified obstacles can be removed and future efforts can benefit by this cataloging and discussion of results.

1502 Geology and Hydrology of Geothermal Systems

392 (CONF-920378–, pp. 57-63) **TETRAD reservoir simulation.** Shook, M. (Idaho National Engineering Lab., Idaho Falls (United States)). USDOE Assistant Secretary for Conservation and Renewable Energy, Washington, DC (United States). Geothermal Div. [1992]. DOE Contract AC07-76ID01570. From Geothermal energy program review: geothermal energy and the utility market–the opportunities and challenges for expanding geothermal energy in a competitive supply market; San Francisco, CA (United States); 24-26 Mar 1992. In *Geothermal energy and the utility market – the opportunities and challenges for expanding geothermal energy in a competitive supply market: Proceedings. Geothermal Program Review X.* 230p. Order Number DE92019090. Source: OSTI; NTIS.

The complexities of operating a geothermal field make it useful to incorporate reservoir simulation in the suite of tools available for the management of the resource. The criteria used in selecting a useful numerical simulator include such issues as ease of use, input/output options, and continued user support. The simulator must be validated to ensure that it yields correct results. Having been validated, the simulator can then be used to improve the predictive capabilities required to optimize geothermal resource management. The simulator TETRAD is used by INEL's Geothermal Reservoir Technology Program, based on the selection criteria noted above. Code validation was achieved through the solution of the Stanford Geothermal Problem Set. TETRAD was then used in a parametric evaluation of reservoir properties. The parametric study demonstrates the importance of various input parameters to accurate simulation. Parameters investigated include reservoir structure, relative permeability- and capillary pressure-saturation relationships, and dual porosity parameters. A field scale study is also presented that shows the importance of considering reservoir structure and the location of other wells in siting new wells.

393 (CONF-920378–, pp. 135-141) **A model for large-scale thermal convection in the Long Valley geothermal region.** Hickox, C.E. (Sandia National Labs., Albuquerque, NM (United States)); Dunn, J.C. USDOE Assistant Secretary for Conservation and Renewable Energy, Washington, DC (United States). Geothermal Div. [1992]. DOE Contract AC04-76DP00789. From Geothermal energy program review: geothermal energy and the utility market–the opportunities and challenges for expanding geothermal energy in a competitive supply market; San Francisco, CA (United States); 24-26 Mar 1992. In *Geothermal energy and the utility market – the opportunities and challenges for expanding geothermal energy in a competitive supply market: Proceedings. Geothermal Program Review X.* 230p. Order Number DE92019090. Source: OSTI; NTIS.

A numerical simulation is presented for a simplified model of the Long Valley geothermal system in order to elucidate the nature of the large-scale thermal structure within the system and to assess implications for the drilling program currently underway in the region. The two-dimensional model consists of three horizontal layers, the upper two of which are porous and saturated with a single phase fluid. The system is limited in horizontal extent and heated uniformly from below. An associated planar, natural convective flow is thus produced. The results of the simulation indicate the possibility of wide variations in vertical temperature profiles for the model system, depending on the locations of measurements relative to the convective cells within the layered medium. Thus it can be inferred that, during the early stages of drilling, the vertical temperature distribution may not be a reliable indicator of the presence or absence of the relatively shallow magma body which has been predicted to underlie the geothermal region.

394 (CONF-920378–, pp. 177-182) **Reservoir modeling and prediction at Pleasant Bayou geopressured-geothermal reservoir.** Shook, M. (Idaho National Engineering Lab., Idaho Falls (United States)). USDOE Assistant Secretary for Conservation and Renewable Energy, Washington, DC (United States). Geothermal Div. [1992]. DOE Contract AC07-76ID01570. From Geothermal energy program review: geothermal energy and the utility market–the opportunities and challenges for expanding geothermal energy in a competitive supply market; San Francisco, CA (United States); 24-26 Mar 1992. In *Geothermal energy and the utility market – the opportunities and challenges for expanding geothermal energy in a competitive supply market: Proceedings. Geothermal Program Review X.* 230p. Order Number DE92019090. Source: OSTI; NTIS.

Modeling and prediction of geopressured-geothermal reservoirs is an excellent example of an engineering problem that can be solved through many different means. The problem may be approached from a purely numerical viewpoint, where a successful history match demonstrates the validity of the reservoir model, or from an analytical point of view. Each method has its own inherent limitations and weaknesses. Such limitations can be minimized by using some combination of both numerical and analytical methods, taking advantage of the strengths of each without the attendant weaknesses. This paper describes a combined numerical/analytical approach to reservoir engineering at the Pleasant Bayou geopressured-geothermal reservoir. A reservoir description had previously been developed, through which a successful history match was performed. Certain details of the reservoir can also be obtained through analysis of pressure and flow transients; these can then be used to constrain the numerical model. Methods for extracting such reservoir data are discussed, and the manner in which they can be used as constraints in the numerical models are presented.

395 (LBL–32139) **LBL research on The Geysers: Conceptual models, simulation and monitoring studies.** Bodvarsson, G.S.; Lippmann, M.J.; Majer, E.L.; Pruess, K. Lawrence Berkeley Lab., CA (United States). Mar 1992. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00098. (CONF-920378–10: Geothermal energy program review: geothermal energy and the utility market–the opportunities and challenges for expanding geothermal energy in a competitive supply market, San Francisco, CA (United States), 24-26 Mar 1992). Order Number DE93000628. Source: OSTI; NTIS; GPO Dep.

As part of The Geysers research activities of DOE's Geothermal Reservoir Technology Program, LBL, in close co-operation with industry, is performing fundamental and applied studies of vapor-dominated geothermal systems. These studies include the development of new methods for evaluating cold water injection, monitoring of the seismic activity in The Geysers associated with injection and production, interpretation of pressure and geochemical changes measured during well tests and long-term production and injection operations, and improvement of existing models of the geothermal system. A review is given of the latest results of DOE-sponsored LBL reservoir engineering and seismic studies relevant to The Geysers.

396 (CONF-920378–, pp. 89-91) **Downhole memory-logging tools.** Lysne, P. (Sandia National Labs., Albuquerque, NM (United States)). USDOE Assistant Secretary for Conservation and Renewable Energy, Washington, DC (United States). Geothermal Div. [1992]. DOE Contract AC04-76DP00789. From Geothermal energy program review: geothermal energy and the utility market–the opportunities and challenges for expanding geothermal energy in a competitive supply market; San Francisco, CA (United States); 24-26 Mar 1992. In *Geothermal energy and the utility market – the opportunities and challenges for expanding geothermal energy in a competitive supply market: Proceedings. Geothermal Program Review X.* 230p. Order Number DE92019090. Source: OSTI; NTIS.

Logging technologies developed for hydrocarbon resource evaluation have not migrated into geothermal applications even though data so obtained would strengthen reservoir characterization efforts. Two causative issues have impeded progress: (1) there is a general lack of vetted, high-temperature instrumentation, and (2) the interpretation of log data generated in a geothermal formation is in its infancy. Memory-logging tools provide a path around the first obstacle by providing quality data at a low cost. These tools feature on-board computers that process and store data, and newer systems may be programmed to make decisions. Since memory tools are completely self-contained, they are readily deployed using the slick line found on most drilling locations. They have proven to be rugged, and a minimum training program is required for operator personnel. Present tools measure properties such as temperature and pressure, and the development of noise, deviation, and fluid conductivity logs based on existing hardware is relatively easy. A more complex geochemical tool aimed at a quantitative analysis of potassium, uranium and thorium will be available in about one year, and it is expandable into all nuclear measurements common in the hydrocarbon industry. A second tool designed to sample fluids at conditions exceeding 400 C is in the proposal stage. Partnerships are being formed between the geothermal industry, scientific drilling programs, and the national laboratories to define and develop inversion algorithms relating raw tool data to more pertinent information.

397 (LA–12382-MS) **Closed-loop flow test Miravalles Geothermal Field well log results.** Dennis, B.; Eden, G.; Lawton, R. Los Alamos National Lab., NM (United States). [1992]. 30p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. Order Number DE93001360. Source: OSTI; NTIS; GPO Dep.

The Instituto Costarricense de Electricidad (ICE) conducted a closed-loop flow test in the Miravalles Geothermal Field. The closed-loop test was started in May and ran through August of 1990. The effluent from the production well PG-11 was carried by a pipeline through a monitor station to the injection well PG-2. Before starting the long-term flow test in May, cold-water injection experiments were performed in each well to determine the pressure and temperature response. A series of downhole measurements were made in each well to obtain background information. The downhole measurements were repeated in August just before terminating the flow test to evaluate the results.

1505 Economic, Industrial, and Business Aspects

398 (CONF-920378–, pp. 7-10) **Geothermal energy market in southern California: Past, present and future.** Budhraja, V.S. (Southern California Edison, Rosemead (United States)). USDOE Assistant Secretary for Conservation and Renewable Energy, Washington, DC (United States). Geothermal Div. [1992]. From Geothermal energy program review: geothermal energy and the utility market–the opportunities and challenges for expanding geothermal energy in a competitive supply market; San Francisco, CA (United States); 24-26 Mar 1992. In *Geothermal energy and the utility market – the opportunities and challenges for expanding geothermal energy in a competitive supply market: Proceedings. Geothermal Program Review X.* 230p. Order Number DE92019090. Source: OSTI; NTIS.

The author discusses the outlook for the geothermal industry, framing it within Southern California Edison's experience with geothermal and other alternative/renewable energy sources. Edison now has 633 MW of geothermal on its system, representing 3.2% of their capacity. They also use more wind and solar energy for power generation than any other utility. The paper discusses the cost of geothermal power, the competition it faces, and what needs to be done to make geothermal energy more cost competitive with cheaper fossil fuels.

1506 Environmental Aspects

399 (DOE/NV/10425–T12) **Geopressured-geothermal well activities in Louisiana: Annual report, 1 January 1991–31 December 1991.** John, C.J. Louisiana Geological Survey, Baton Rouge, LA (United States). Oct 1992. 128p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FC07-85NV10425. Order Number DE93002865. Source: OSTI; NTIS; INIS; GPO Dep.

Since September 1978, microseismic networks have operated continuously around US Department of Energy (DOE) geopressured-geothermal well sites to monitor any microearthquake activity in the well vicinity. Microseismic monitoring is necessary before flow testing at a well site to establish the level of local background seismicity. Once flow testing has begun, well development may affect ground elevations and/or may activate growth faults, which are characteristic of the coastal region of southern Louisiana and southeastern Texas where these geopressured-geothermal wells are located. The microseismic networks are designed to detest small-scale local earthquakes indicative of such fault activation. Even after flow testing has ceased, monitoring continues to assess any microearthquake activity delayed by the time dependence of stress migration within the earth. Current monitoring shows no microseismicity in the geopressured-geothermal prospect areas before, during, or after flow testing.

competitive supply market: Proceedings. Geothermal Program Review X. 230p. Order Number DE92019090. Source: OSTI; NTIS.

The reservoir technology program supports the utilization of geothermal resources through development and verification of new earth science technologies for: exploration, fluid production and injection, and prediction of reservoir lifetimes. A two-fold strategy of conducting DOE-sponsored research to meet higher-risk, longer-term needs and cost-shared research with industry in areas of greatest current need is utilized to maximize the benefit of the program to the geothermal industry. Research at The Geysers geothermal field has received major emphasis in the past three years. The paper summarizes this research. Two small programs support the understanding of the chemical evolution of geothermal systems and changes in gravimetric pattern of geothermal systems. The reservoir technology program has recently initiated a program directed toward increasing the use of the low- and moderate-temperature geothermal resources of the US. The program will update the existing inventories of hydrothermal resources and provide outreach to potential users of geothermal resources, particularly users of geothermal heat pumps. The Geothermal Technology Organization and DOE have completed studies of the applicability of advanced seismic techniques to monitor injection and productivity enhancement at The Geysers steam field, and validation of vapor phase tracers and tracer return data from an industry tracer-injection test in the southeast Geysers.

401 (CONF-920378–, pp. 31-36) **LBL research on The Geysers: Conceptual models, simulation and monitoring studies.** Bodvarsson, G.S. Lost circulation is the loss of drilling fluid from the wellbore to fractures or pores in the rock formation. In geothermal drilling, lost circulation is often a serious problem that contributes greatly to the cost of the average geothermal well. The Lost Circulation Technology Development Program is sponsored at Sandia National laboratories by the US Department of energy. The goal of the program is to reduce lost circulation costs by 30-50% through the development of mitigation and characterization technology. This paper describes the technical progress made in this program during the period April, 1991-March, 1992.

403 (DOE/ID/13040–T11) **Data acquisition for low-temperature geothermal well tests and long-term monitoring: Final report.** Lienau, P.J. Oregon Inst. of Tech., Klamath Falls, OR (United States). Groundwater monitoring is an essential part of the development of a low-temperature geothermal field for production and injection wells. State water resource and environmental departments are requiring both geothermal well testing and long-term monitoring as a part of the permitting process for geothermal developments. This report covers water-level measurement methods, instruments used for well testing, geochemical sampling, examples of data acquisition and regulatory mandates on groundwater monitoring.

404 (LBL–32357) **Boiling and condensation processes in the Cerro Prieto beta reservoir under exploitation.** Truesdell, A. (Truesdell (Alfred), Menlo Park, CA (United States)); Manon, A.; Quijano, L.; Coplen, T.; Lippmann, M. Lawrence Berkeley Lab., CA (United States). Jan 1992. 11p. Sponsored by USDOE, Washington, DC (United States); Geological Survey, Reston, VA (United States). DOE Contract AC03-76SF00098. (CONF-920119–4: 17. workshop on geothermal reservoir engineering, Stanford, CA (United States), 29-31 Jan 1992). Order Number DE93000630. Source: OSTI; NTIS; GPO Dep.

The deep Cerro Prieto (Baja California, Mexico) beta reservoir is offset vertically by the southwest-northeast trending, normal H fault. Under exploitation pressures in the upthrown block have decreased strongly resulting in boiling and high-enthalpy production fluids. Significant differences in fluid chemical and isotopic compositions are observed in the two parts of the reservoir and particularly in an anomalous zone associated with the H fault. These differences result from intense boiling and adiabatic steam condensation, as well as from leakage of overlying cooler water along the fault.

Order Number DE93721624. Source: OSTI; NTIS.

The paper describes the present wind energy activities in Finland. The results of the national research programme on Advanced energy systems NEMO show e.g. that wind energy could contribute 10 % of the electric energy in Finland. In the near future one of the most important goals is to demonstrate the technical as well as the economical feasibility of wind power in Finland.

408 (NEI-FI–168, pp. 116-120) **The use of numerical maps for description of effective roughness.** Tammelin, B. (Finnish Meteorological Institute, Helsinki (Finland)); Wolff, J. Finnish Wind Power Association, Espoo (Finland). 1990. (CONF-9010521–: FINNWIND'90: conference on wind power in Finland, Pori (Finland), 19-20 Oct 1990). In *Finnwind'90: Presentations.* 120p. Order Number DE93721624. Source: OSTI; NTIS.

The roughness of the terrain around the site of a planned WECS has a great effect on the estimated wind energy resources. Typically the effective roughness has to be calculated for twelve wind directions for several distances. In Finland the typical sites of WECS are on the inhomogeneous coast or in the shattered archipelago. The use of numerical maps produced mainly for purposes of forest analysis provides a helpful tool to analyze the terrain at such a sites, especially when several sites are to be compared.

This books contains a collection of progress reports from the participating contractors in the wind energy R and D sub-programme within the JOULE (Joint Opportunities for Unconventional or Long term Energy supply) programme on non-nuclear energy and rational use of energy. The current wind energy programme consists of 25 multi-partner projects which are closely interrelated and cover a broad spectrum of topics. These are grouped within the following research areas: A: Wind measuring and modelling; B: Wind turbine experiments and utilisation; C: Development of components and models; D: Stand-Alone and offshore; E: Large-wind turbines.

411 (NEI-FI–168, pp. 3-9) **Commercialisation of wind farms in Europe by the year 2000.** Musgrove, P. (Wind Energy Group, Hayes (GB)); Lindley, D. Finnish Wind Power Association, Espoo (Finland). 1990. (CONF-9010521–: FINNWIND'90: conference on wind power in Finland, Pori (Finland), 19-20 Oct 1990). In *Finnwind'90: Presentations.* 120p. Order Number DE93721624. Source: OSTI; NTIS.

By the end of 1989 approximately 325 MW of wind turbine capacity had been installed in Europe, corresponding to the grid connection of over 3000 wind turbines. Although this is only about one quarter of the capacity installed in California it is now becoming clear that Europe will see major market growth through the early 1990s. The progress that has been made towards the commercialisation of wind energy in the European Community up to 1990 is reviewed, and it is shown that wind energy has the potential to make a substantial contribution towards European electricity needs, and in so doing can: reduce European dependence on imported fuels, help meet European goals for reduced carbon dioxide emissions, and reduce acid rain emissions. Electricity from wind farms on good European sites is already cheaper than nuclear power, and is close to competitive with electricity from coal. In fact if compensation is given for the environmental damage avoided (through the absence of polluting emissions) then wind energy is already competitive with coal in large areas of Europe. Europe could and should target to achieve 10 % of its electricity needs from the wind by the second quarter of the next century. This will require the installation of 100 000 MW of wind turbines. Over the next, crucial, decade it is realistic to set a target of 5000 MW installed by the year 2000, with an installation rate by then of over 1000 MW/year. However political action is required if these goals are to be met, to ensure that wind generated electricity gets paid an equitable price that includes allowance for the avoided external costs.

413 (INIS-mf–13362, pp. 062-066) **A 3 MW wind power plant at Maglarp in Sweden.** Koc, B. Czechoslovak Solar Energy (Czechoslovakia); Ceske Vysoke Uceni Technicke, Prague (Czechoslovakia). 1991. 121p. (In Czech). (CONF-9107237–: Renewable energy sources '91 international conference, Prague (Czechoslovakia), 1 Jul 1991). In *Renewable energy sources '91. Part 2: Wind energy, biogas, small hydro.* Order Number DE93605634. Source: OSTI; NTIS (US Sales Only); INIS.

The wind power plant at Maglarp, in a frequented region of Sweden, is described. Its technical parameters are given and its environmental impacts are dealt with. The whiz of the rotor blades is heard at a distance of 500 to 1000 m; the author refers to the whiz as pleasant. Not a single bird has been found killed by the facility. Interference with the TV signal can at times be observed in the town; this is more marked with metal rotor blades than with blades made of reinforced plastic. A wing of the wind power plant concentrates on its surface an energy of about 20 kW per square meter. (M.D.).

414 (DOE/CH/10250–T1) **Field investigation of a wake structure downwind of a VAWT in a windfarm array.** Liu, H.T.; Buck, J.W.; Germain, A.C.; Hinchee, M.E.; Solt, T.S.; LeRoy, G.M.; Srnsky, R.A. Flow Research Co., Kent, WA (United States). Applied Mechanics Div. Oct 1987. 104p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FC02-86CH10250. Order Number DE93001395. Source: OSTI; NTIS; GPO Dep.

The effects of upwind turbine wakes on the performance of a FloWind 17-m VAWT were investigated through a series of field experiments conducted at the FloWind windfarm on Cameron Ridge, Tehachapi, California. The field experiment was conducted within a VAWT array consisting of more than nine VAWTs with separations 3D crosswised by 8D downwind (where D is the turbine diameter) in a staggered configuration. The array is the upwind three rows of VAWTS in a total of six rows that are on top of the Cameron Ridge plateau. The terrain features in the vicinity are reasonably regular, with an upslope of 7 deg on the average; however, several local irregularities are present. The annual hourly averaged wind speed exceeds 8 m/s at the site. The wind field and the power-outputs of nine turbines within the array were measured with wind sensors and power transducers. Nine Gill propeller and 18 Maximum cup anemometers and one direction sensor were mounted on portable and stack-up towers installed upwind and within the turbine array. From the field measurements, the velocity and power/energy deficits were derived under various turbine on/off configurations. Much information was provided to characterize the structure of VAWT wakes and to assess their effects on the performance of downwind turbines. Recommendations are made for optimizing windfarm design and operations as well as for wind energy management.

415 (DOE/CH/10253–T1) **Free-flow variability on the Jess and Souza Ranches, Altamont Pass: [Final report].** Nierenberg, R. Altamont Energy Corp., Corte Madera, CA (United States). 25 Apr 1988. 171p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FC02-86CH10253. Order Number DE93002939. Source: OSTI; NTIS; GPO Dep.

A central monitoring computer was installed on each ranch. The computers were connected by communication cables to 50 turbines on the Souza Ranch and 150 turbines on the Jess Ranch. Anemometers were installed on every other turbine on 12-foot booms at 35 feet above ground level (AGL). Spacing between anemometers was approximately 200 feet in the crosswind direction by 500 feet in the parallel direction. A total of 23 turbines on the Souza Ranch was instrumented in this fashion, as well as two multi-level meteorological towers. On the Jess Ranch, 77 turbines were instrumented; about half at 35 feet AGL and half at 50 feet AGL, plus four additional towers. Wind data were collected for approximately a 100 hour period on each ranch. All turbines were shut down during these periods so that no turbine wakes would be present. The data periods were selected by the meteorologist to insure that they occurred during typical spring-summer flow regimes. The terrain features upwind of the site appear to play as significant a role in the flow variability as terrain features within the site.

416 (ECN-I–92-028) **Survey on frequency responses of pressure tubes installed in a 12.5 meter rotor blade.** Spaeth, M.; Stefanatos, N. Netherlands Energy Research Foundation (ECN), Petten (Netherlands). Jun 1992. 37p. Project ECN 4240. Order Number DE92557289. Source: OSTI; NTIS (US Sales Only).

A series of preparatory activities are envisaged with respect to the instrumentation of a 12.5 meter wind turbine rotor blade with a high speed pressure scanning system. Local static pressures at the surface of the rotor blade will be measured into chordwise direction. Therefore pressure taps are manufactured to guide the pressures via pressure tubes to the scanner system. The aim of the preparatory task was the investigation of the response of the pressure tubes to fluctuating pressure signals and the selection of the optimum geometrical characteristics of the pressure tubes. Different configurations of tubing have been tested to define the frequency response dependency on the geometrical characteristics of the tube. During the test sequences the pressure tubes were connected to the scanner system to obtain realisitc measurement conditions. The results of the work demonstrate that if the diameter of the pressure tubes is chosen 1 mm and if their length is $\leq$1 meter, no serious deformation of the pressure signal is seen for the frequency range of interest (0-40 Hz). 17 figs., 1 tab., 2 apps., 8 refs.

417 (ECN-I–92-029) **Selection of an anemometer for the measurement of wind turbulence.** Cervenka, S. Netherlands Energy Research Foundation (ECN), Petten (Netherlands). Jun 1992. 22p. Project ECN 4478. Order Number DE92557290. Source: OSTI; NTIS (US Sales Only).

A brief description is given of the different methods for the measurement of wind velocities. One of these methods, the ultrasonic method, was selected to measure wind velocity for purposes of wind turbulence studies. Other methods examined are the mechanical methods, cup and propellor, the hot wire method and the SODAR (SOund Detection And Ranging) Doppler and laser doppler methods. 8 refs.

418 (ETDE-IT–92-81) **Evaluation of damage caused by lightning current flowing through bearings of wind power generators.** Celi, O.; Pigini, A.; Garbagnati, E. Centro Elettrotecnico Sperimentale Italiano (CESI), Milan (Italy); Ente Nazionale per l'Energia Elettrica, Milan (Italy). 1991. 4p. Order Number DE93729442. Source: OSTI; NTIS (US Sales Only).

In this research study, lightning currents of different amplitude were applied to wind power generator roller bearings in different test conditions and the damage caused by the lightning current flow were analyzed. The various influences of the load acting on the bearing, the presence of lubricants, and bearing rotation were investigated.

419 (NEI-DK–953) **Development of wind/diesel module system.** Rasmussen, P. Nordvestjysk Folkecenter for Vedvarende Energi, Hurup (Denmark). Jul 1991 34p. (In Danish). Contract ENS-UVE-88.1206. Order Number DE93721383. Source: OSTI; NTIS.

The aim was to develope a practical industrial solution for a hybrid system for a wind turbine and diesel generator. The system is a modular design involving standard industrial components interconnected with a minimum of control equipment. Operation is simple and prices are low, due to the competitive market prices of the components. The power range is between 7 kW - 200 kW. The system is built around a local grid based on fixed AC frequency of 50-60 Hertz supplied from a semiconductor inverter with a back-up battery bank. The inverter uses pulse width modulation with a switch frequency over 10kHz, which enables the net filters to give a perfect sine wave output in accordance with normal standards for power quality. The storage battery bank has a capacity of 10 min. full load supply in order to average fluctuations in wind power. During low load periods, the battery alone can feed the local grid. A lower specific capacity could be attractive in order to minimize the overflow whilst retaining a high power output and efficiency at lower wind speeds. For smaller systems the DC technique is convenient, such as a 24 volt battery with DC consumption with the possibility of supplying AC through an inverter. In the case of larger systems, the diesel set and wind turbine should be divided into smaller units in order to operate one or more units separately. This will minimize partial load losses in parallel operation with wind power. (AB)

420 (NEI-FI–168, pp. 11-17) **Wind energy activities in Sweden.** Engstroem, S. (The National Energy Administration, Stockholm (Sweden)); Svensson, G. Finnish Wind Power Association, Espoo (Finland). 1990. (CONF-9010521–: FINNWIND'90: conference on wind power in Finland, Pori (Finland), 19-20 Oct 1990). In *Finnwind'90: Presentations.* 120p. Order Number DE93721624. Source: OSTI; NTIS.

National Swedish activities on wind power started in 1975 with a basic research programme. In 1979 two large WECS, Naesudden, 2 MW and Maglarp, 3 MW, were ordered, with full financing from public research funds. An evaluation was carried out in 1985. In 1988 the results of a siting study were published, recommending sites for more than 20 TWh/yr of wind power, most of it offshore. Today research funds handled by the National Energy Administration still bears the main responsibility for the basic research on wind energy, which is carried out at a level of SEK 15 M/yr,

whereas the utilities have increased their responsibility for the hardware development. Thus the new 3 MW wind turbine at Naesudden, which will have its first rotation during 1991, is 75 % funded to by utility funds. Other projects co-financed with the utilities and the manufacturing industry are the development of a 400 Kw turbine, a 220 Kw offshore pilot plant and further technical studies of full-scale off-shore wind power.

While the standard grid connected wind power technology certainly has reached the point of a major break through in Europe, a number of wind technology applications are still in the R and D phase; this paper intends to give an overview of 3 applications currently being investigated in a Finno-Danish industrial cooperation, including Neste Advanced Power Systems of Finland, Nordtank Energy Croup of Denmark and various consultancy companies. The wind technology applications being investigated are arctic applications, stand-alone applications and wind/hydrogen applications. The 2 first mentioned projects are treated in more detail by other papers at this conference.

424 (CONF-9205123–13) **Evaluation of austenitic alloys for advanced steam cycles and hot-gas cleanup systems.** Swindeman, R.W. Oak Ridge National Lab., TN (United States). [1992]. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From 6. annual fossil energy materials conference; Oak Ridge, TN (United States); 12-14 May 1992. Order Number DE93000724. Source: OSTI; NTIS; GPO Dep.

The fossil fuels power industry in the United States is experiencing a broad range of choices in meeting energy needs of the country. In the near term, life-extension with improved flexibility and reliability in existing plants is an issue of primary concern. In the longer range, improved efficiency will be needed, and this will come about by the development of advanced steam cycle and combined cycle power plants. vary significantly from one power plants. The performance requirements for structural materials vary significantly from one application to the next. Requirements become more demanding with increased service temperature. (1) Studies were completed of the potential of type 316N stainless steel for main streamline piping. Data for service-exposed base metal indicated good strength and ductility after many hours of service at 540°C. A CRE 16-8-2 stainless steel filler metal was found to be a good match for creep strength. (2) Stress-rupture testing of Gr-91 steel was undertaken to better define the strength of the steel at 600°C. It was found that the current stress allowables in the ASME Codes were representative of materials included in the original data base. (3) Research efforts were completed on austenitic alloys superheaters in an advanced steam cycle PC power plant. Testing of weldments was continued because of their general interest to industry. Both CRE 16-8-2 stainless steel and alloy 556 filler metals were tested to times exceeding 10,000 h. (4) Evaluation of modified alloy 800 was extended to temperatures above 700°C to support the need for materials in heat recovery and hot-gas cleanup systems that will experience service in the range of 760 to 925°C. (5) Efforts were begun to produce data needed to define acceptance criteria for new materials in pressure-bearing applications at temperatures above 816°C.

425 (DOE/PC/91154–T2) **Development of a high-performance coal-fired power generating system with pyrolysis gas and char-fired high temperature furnace (HITAF): Quarterly progress report 2, April–June 1992.** Foster Wheeler Development Corp., Livingston, NJ (United States). Jul 1992. 46p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-91PC91154. Order Number DE92041249. Source: OSTI; NTIS; GPO Dep.

The system proposed to meet these goals is a combined-cycle system where air for a gas turbine is indirectly heated to approximately 1800°F in furnaces fired with coal-derived fuels and then directly heated in a natural-gas fired combustor up to about 2400°F. The system is based on a pyrolyzing process that converts the coal into a low-Btu fuel gas and char. The fuel gas is a relatively clean fuel, and it is fired to heat tube surfaces that are susceptible to corrosion and problems from ash deposition. In particular, the high-temperature air heater tubes, which will need to be a ceramic material, will be located in a separate furnace or region of a furnace that is exposed to combustion products from the low-Btu fuel gas only. Bechtel investigated different cycle analysis programs, and one was selected for use on this project. The program was then run for different pyrolyzer conditions, steam conditions, and gas turbine blade cooling airflow. This information yielded trends that were used to develop preliminary cycle parameters. Next, all team members estimated the range of significant operating parameters and capacities for their equipment. Bechtel then determined a plant size and equipment arrangement that would be reasonable for the commercial plant design. The cycle analysis, plant size, and equipment arrangement developed in this subtask will serve as a starting point for the subsystem and component R&D. After the subsystem R&D and the necessary trade-off studies have been completed, the cycle analysis and plant arrangement will be re-evaluated.

426 (ENEL-CRTN-T6–91-15) **Boiler pressure drop: Review of ENEL cycle chemistry experience.** Sigon, F.; Quadri, G. Ente Nazionale per l'Energia Elettrica, Milan (Italy). Centro Termica e Nucleare. 1991. 28p. Order Number DE93729438. Source: OSTI; NTIS (US Sales Only).

ENEL (Italian Electricity Board) research and long term plant experience on the effects of cycle chemistry on boiler pressure drop increasing with operating time are reviewed. The information refers specifically to fossil fired power plants with AVT (All Volatile Treatment) cycle chemistry and once-through and drum boilers. The most relevant chemistry parameters are considered in the search for correlations and in the investigation of possible mechanisms related to the phenomenon.

427 (ANL/ESD/TM–35) **Emissions of airborne toxics from coal-fired boilers: Mercury.** Huang, H.S.; Livengood, C.D.; Zaromb, S. Argonne National Lab., IL (United States). Energy Systems Div. Sep 1991. 35p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. Order Number DE93002760. Source: OSTI; NTIS; GPO Dep.

Concerns over emissions of hazardous air Pollutants (air toxics) have emerged as a major environmental issue, and the authority of the US Environmental Protection Agency to regulate such pollutants was greatly expanded through the Clean Air Act Amendments of 1990. Mercury has been singled out for particular attention because of concerns over possible effects of emissions on human health. This report evaluates available published information on the mercury content of coals mined in the United States, on mercury emitted in coal combustion, and on the efficacy of various environmental control technologies for controlling airborne emissions. Anthracite and bituminous coals have the highest mean-mercury concentrations, with subbituminous coals having the lowest. However, all coal types show very significant variations in mercury concentrations. Mercury emissions from coal combustion are not well-characterized, particularly with regard to determination of specific mercury compounds. Variations in emission rates of more than an order of magnitude have been reported for some boiler types. Data on the capture of mercury by environmental control technologies are available primarily for systems with electrostatic precipitators, where removals of approximately 20% to over 50% have been reported. Reported removals for wet flue-gas-desulfurization systems range between 35 and 95%, while spray-dryer/fabric-filter systems have given removals of 75 to 99% on municipal incinerators. In all cases, better data are needed before any definitive judgments can be made. This report briefly reviews several areas of research that may lead to improvements in mercury control for existing flue-gas-clean-up technologies and summarizes the status of techniques for measuring mercury emissions from combustion sources.

428 (DOE/FE–0265P) **Comprehensive report to congress Clean Coal Technology Program: Milliken Clean Coal Technology Demonstration Project.** USDOE Assistant Secretary for Fossil Energy, Washington, DC (United States). Office of Clean Coal Technology. Sep 1992. 50p. Sponsored by USDOE, Washington, DC (United States). Order Number DE93001756. Source: OSTI; NTIS; GPO Dep.

In response to the PON, 33 proposals were received by DOE in May 1991. After evaluation, nine projects were selected for award. One of the nine projects selected for funding is a project proposed by the New York State Electric & Gas Corporation called the Milliken Clean Coal Technology Demonstration. This project will provide full-scale demonstration of a combination of innovative emission-reducing technologies and plant upgrades for the control of sulfur dioxide (SO_2) and nitrogen oxides (NO_x) emissions from a coal-fired steam generator, without a significant loss of efficiency. The Saarberg-Hoelter Umwelttechnick (S-H-U) process will be used to reduce SO_2 emissions by up to 98%. In the S-H-U process, the flue gas is scrubbed with a limestone slurry in an absorber vessel that does not contain packing or grid work. The lack of packing results in a low pressure drop across the absorber, which decreases energy requirements. The S-H-U slurry is maintained at a low pH by adding formic acid, which acts as a buffer, to the limestone slurry. A slipstream is processed for recovery of high-quality by-product gypsum and calcium chloride. Water is recovered and recycled to the process. This will be the first US demonstration of the S-H-U process and will include the innovative feature of a tile-lined, split-flow absorber constructed below the flues. NO_x emissions will be reduced by a combination of combustion modifications and the installation of the NO_xOUT urea injection technology. The NO_xOUT technology is capable of reducing NO_x emissions without affecting the salability of the flyash.

429 (DOE/PC/89652–T7) **Demonstration of Selective Catalytic Reduction (SCR) technology for the control of nitrogen oxide (NO_x) emissions from high-sulfur coal-fired boilers: Innovative Clean Coal Technology (ICCT): Quarterly report No. 7, January–March 1992.** Southern Co. Services, Inc., Birmingham, AL (United States). May 1992. 43p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FC22-90PC89652. Order Number DE92041250. Source: OSTI; NTIS; GPO Dep.

The objective of this project is to demonstrate and evaluate commercially available Selective Catalytic Reduction (SCR) catalysts from US, Japanese and European catalyst suppliers on a high-sulfur US coal-fired boiler. SCR is a post-combustion nitrogen oxide (NO_x) control technology that involves injecting ammonia into the flue gas generated from coal combustion in an electric utility boiler. The flue gas containing ammonia is then passed through a reactor that contains a specialized catalyst. In the presence of the catalyst, the amonia reacts with NO_x to convert it to nitrogen and water vapor. Although SCR is widely practiced in Japan and Europe, there are numerous technical uncertainties associated with applying SCR to US coals. These uncertainties include: (1) potential catalyst deactivation due to poisoning by trace metal species present in US coals that are not present in other fuels. (2) performance of the technology and effects on the balance-of-plant equipment in the presence of high amounts of SO, and SO_3. (3) performance of a wide variety of SCR catalyst compositions, geometries and methods of manufacture under typical high-sulfur coal-fired utility operating conditions. These uncertainties will be explored by constructing a series of small-scale SCR reactors and simultaneously exposing different SCR catalysts to flue gas derived from the combustion of high sulfur US coal. The demonstration will be performed at Gulf Power Company's Plant Crist Unit No. 5 (75 MW capacity) near Pensacola, Florida. The project will be funded by the US Department of Energy (DOE), Southern Company Services, Inc. (SCS on behalf of the entire Southern electric system), and the Electric Power Research Institute.

430 (DOE/PC/90292–T5) **Alternative formulations of regenerable flue gas cleanup catalysts: Progress report, September 1, 1991–November 30, 1991.** Mitchell, M.B.; White, M.G. Clark Atlanta Univ., GA (United States). 27 Aug 1992. 13p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG22-90PC90292. Order Number DE92041248. Source: OSTI; NTIS; GPO Dep.

Progress includes studies of the adsorption and desorption of SO_2 on alumina and impregnated alumina. This report describes the adsorption and desorption characteristics of sulfur dioxide in contact with a high purity γ-alumina and initial results of our efforts to prepare samples of the γ-alumina decorated with magnesium acetylacetonate dehydrate $[Mg(acac)_2{\cdot}2H_2O]$. The NOXSO regenerable flue gas cleanup catalyst uses a γ-alumina which has been doped with sodium through an aqueous impregnation with sodium carbonate and subsequent calcination. We are investigating other metals as promoters for the adsorption Of $S0_2$ and NO_x on alumina. We have characterized the aluminas with regard to impurities present and crystallinity and have set up a controlled environment infrared spectroscopic cell and thermal gravimetric apparatus. These issues have been covered in previous reports. In this report, we report our adsorption/desorption studies of $S0_2$ on pure alumina. As part of our investigation of the modification of alumina surfaces for the selective adsorption Of $S0_2$, we are investigating the use of non-aqueous impregnation techniques for the preparation of well-dispersed monolayers of promoters on alumina surfaces.

431 (DOE/PC/90361–T7) **Catalytic fabric filtration for simultaneous NO_x and particulate control: Quarterly technical progress report, April 1–June 30, 1992.** Weber, G.F.; Ness, S.R.; Laudal, D.L.; Dunham, G. North Dakota Univ., Grand Forks, ND (United States). Energy and Environmental Research Center. Aug 1992. 72p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-90PC90361. Order Number DE93000645. Source: OSTI; NTIS; GPO Dep.

The objective of this program is to develop advanced concepts for the removal of NO_x from flue gas emitted by coal-fired utility boilers, or for the control of NO_x formation by advanced combustion modification techniques. Funded projects are required to focus on the development of technology that significantly advances the

state of the art using a process or a combination of processes capable of reducing NO_x emissions to 60 ppm or less. The concept must have successfully undergone sufficient laboratory-scale development to justify scaleup for further evaluation at the pilot scale (not to exceed 5 MWe in size). The EERC approach to meeting the program objective involves the development of a catalytic fabric filter for simultaneous NO_x and particulate control. The idea of applying either permanent or throwaway catalysts to a high-temperature fabric filter for NO_x control is not new. However, advances at OCF have shown that a high-activity catalyst can be applied to a high-temperature woven glass cloth resulting in a fabric filter material that can operate at temperatures higher than the maximum operating temperatures of commercially available, coated glass fabric. The NO_x is removed by catalytic reduction with ammonia to form nitrogen and water. The catalyst employed at this time is vanadium/titanium, but the exact catalyst composition and the unique method of applying the catalyst to high-temperature glass fabric are the property of OCF. Other catalyst options are being evaluated by OCF in order to improve catalyst performance and minimize catalyst cost.

432 (DOE/PC/90365–T7) **Fundamental mechanisms in flue gas conditioning: Quarterly report, April 1992–June 1992.** Snyder, T.R.; Vann Bush, P. Southern Research Inst., Birmingham, AL (United States). 27 Jul 1992. 31p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-91PC90365. (SRI-ENV–92-603-7375-Q4). Order Number DE92040539. Source: OSTI; NTIS; GPO Dep.

SEM pictures of the three mixtures of sorbent and ash from the DITF and the base line ESP hopper ash from Muskingum are shown in Figures 1 through 4. The effects of sorbent addition on particle morphology are evident in Figures 2 through 4 by the presence of irregularly shaped particles and deposits on the surfaces of the spherical fly ash particles. In contrast, the base Ene ash particles have the characteristic relatively smooth, spherical morphology normally associated with pulverized-coal (PC) fly ashes. Resistivity determinations made on these four ashes in ascending and descending temperature modes. These data are shown in Figures 5 and 6. Sorbent injection processes performed at the DITF lowered the duct temperature to around 165°F from about 350°F for base line operation. Consequently, during collection in the ESP, the particulate matter from the sorbent injection processes had a significantly lower resitivity (approximately 4×10^7 Ω-cm) than the base line ash (approximately 3×10^{11} Ω-cm at 350°F). Specific surface areas and true particle densities have been measured for the four samples obtained from the DOE/PETC Duct Injection Test Facility. These data are summarized in Table 4. The primary difference indicated by these initial analyses of these four samples is the significant increase in specific surface area due to sorbent addition. The specific surface areas of the three sorbent and ash mixtures from the DITF are quite similar.

This study focuses on the effect of alkali adsorption on the agglomeration of particles of bauxite, kaolinite, emathlite, lime, and two types of coal ash. An agglomeration (adhesion) temperature is defined which characterizes the adhesion propensity of particles. Using a small fluidized bed, a unique experimental technique is developed to measure this agglomeration point in-situ. The effects of alkali adsorption on the agglomeration characteristics of the substrates are determined. The agglomeration temperature of all substrates decreases as the alkali content increases. At low alkali loadings, alkali adsorption enhances particle agglomeration by forming new compounds of lower melting points. At high alkali concentrations, adhesion and agglomeration are caused by a layer of molten alkali which covers the exterior of the particles. Alkali surface composition of particles is studied using a Scanning Auger Microprobe (SAM). Results indicate that the alkali surface concentration decreases as agglomeration temperature increases. The use of additives to scavenge alkali vapors is further studied in a pilot scale downflow combustor. SAM surface analyses of additive particles indicate three mechanisms of alkali capture. Adsorption by reaction, surface condensation, and nucleation and coagulation with additive particles. These mechanisms may occur independently or simultaneously depending primarily on the alkali vapor concentration and the temperature profile along the combustion furnace. A mathematical model is developed to represent the kinetics and mechanisms of the alkali adsorption and agglomeration process. Modeling results indicate that the adsorption-reaction process is influenced by diffusion of alkali through the surface product layer. The model predictions of the alkali adsorbed as a function of minimum agglomeration temperature agree very well with the experimental results.

434 (DOE/PC/91284–T1) **Nitration of polynuclear aromatic hydrocarbons in coal combustors and exhaust streams: Quarterly report, September 1, 1991–December 31, 1991.** Yu, Liya; Dadamio, J.; Hildemann, L.; Niksa, S. Stanford Univ., CA (United States). Aug 1992. 17p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG22-91PC91284. Order Number DE93000916. Source: OSTI; NTIS; GPO Dep.

Nitro-polynuclear aromatic hydrocarbons (nitro-PAH) are the predominant mutagens on respirable particles from coal-fired boilers. Since nitro-PAH are not primary products of coal devolatilization, their formation must involve secondary chemistry at elevated temperatures. However, it is not known where in the combustion or exhaust processes they form, which reaction species are involved, or how concentrations are influenced by operating conditior.s. Results from this study will help to relate the environmental impact of mutagenic emissions to boiler firing strategies. The objectives of this three-year project are to (1) identify the conditions which promote the nitration of PAH during primary combustion, reburning, hot gas cleanup, and particulate removal; and (2) investigate the potential relationship between NO_x abatement and PAH nitration. A novel coal flow reactor burning actual coal products operates over the domains of heating rates, temperatures, fuel-equivalence ratios, and residence times in utility boilers. A fluidized bed will be built for studies of simulated hot gas cleanup at lower temperatures. Gas chromatography with chemiluminescence detection will measure the aggregate amount of nitro groups present, to determine when nitro-PAH first appear, and how nitration is affected by the operating conditions. Tars from primary and secondary pyrolysis and oxidative pyrolysis will be fractionated into chain hydrocarbons, polynuclear aromatics, oxygenated species, and a basic fraction, so that their ring number distribution can be monitored with high performance liquid chromatography.

435 (DOE/PC/91306–3) **Sorption and chemical transformation of PAHs on coal fly ash: Technical progress report No. 3, May 1–July 31, 1992.** Mamantov, G.; Wehry, E.L. Tennessee Univ., Knoxville, TN (United States). Dept. of Chemistry. [1992]. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG22-91PC91306. Order Number DE93000518. Source: OSTI; NTIS; GPO Dep.

The results obtained to date indicate that toluene is a useful "probe solute" for measuring the relative affinities of various fly ash fractions for aromatic solutes. In general, the adsorption isotherms obtained for toluene on fly ash fractions can be fit to a Freundlich adsorption isotherm equation, which implies that the adsorbent surface in question is heterogeneous. For most fly ash fractions studied thus far, the measured heat of adsorption decreases as the quantity of toluene injected onto the column increases. This observation also indicates that the fly ash surfaces are heterogeneous. For a homogeneous (or nearly homogeneous) surface, virtually all adsorption "sites" for a particular solute exhibit approximately the same affinity for the solute; hence, the measured heat of adsorption is virtually independent of the amount of solute that is brought into contact with the surface. However, when the surface is heterogeneous, the measured heat of adsorption decreases as the amount of solute is increased; this variation can be used to make inferences regarding surface site energy distributions if certain assumptions and approximations are made. Data obtained to date are summarized.

436 (DOE/PC/91344–T1) **Advanced separation technology for flue gas cleanup: Quarterly technical report No. 1.** SRI International, Menlo Park, CA (United States). Jul 1992. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-92PC91344. Order Number DE92040519. Source: OSTI; NTIS; GPO Dep.

The objective of this work is to develop a novel system for regenerable SO_2 and NO_x scrubbing of flue gas that focuses on (a) a novel method for regeneration of spent SO_2 scrubbing liquor and (b) novel chemistry for reversible absorption of NO_x. In addition, high efficiency hollow fiber contactors (HFC) are proposed as the devices for scrubbing the SO_2 and NO_x from the flue gas. The major cost item in existing technology is capital investment. Therefore, our approach is to reduce the capital cost by using high efficiency hollow fiber devices for absorbing and desorbing the SO_2 and NO_x. Our novel chemistry for scrubbing NO_x win consist of water soluble phthalocyanine compounds invented by SRI and also of polymeric forms of Fe^{++} complexes similar to traditional NO_x scrubbing media described in the open literature. Our past work with the phthalocyanine compounds, used as sensors for NO and NO_2 in flue gases, shows that these compounds bind NO and NO_2 reversibly and with no interference from O_2, CO_2, SO_2, or other components of flue gas. The final novelty of our approach is the arrangement of the absorbers in cassette (stackable) form so that the NO_x absorber can be on top of the SO_x absorber. This arrangement is possible only because of the high efficiency of the hollow fiber scrubbing devices, as indicated by our preliminary laboratory data.

437 (VTT-TIED–1341) **Function and field property of on-line measurement meters.** Vesterinen, R. (Technical Research Centre of Finland, Jyvaeskylae (Finland). Combustion and Thermal Engineering Lab.). Technical Research Centre of Finland, Espoo (Finland). 1992. 100p. (In Finnish). Order Number DE93711153. Source: OSTI; NTIS.

Comparisons of sulphur dioxide and nitrogen oxide meters at the Rauhalahti power plant, and of two sulphur dioxide meters at bark-fueled power plants were made in this research. Six sulphur dioxide meters and three nitrogen oxide meters were included in the comparison. Dust density/particle content of flue gases was also measured by one of the meters, carbon monoxide content with one of the meters, and carbon dioxide and water content with one meter. Daily average indicated by five sulphur dioxide meters was within the range of 10 %. The hourly dispersion of the meters was, however, higher. The results given by one of the meters was one half or one third of those of the others. The results of the nitrogen oxide meters were within the same limits as the main part of the sulphur dioxide meters. The Sick GM 21 and Opsis meters, measuring through the channel, had been calibrated by the manufacturer and could not be readjusted by using calibration gas. The Ultramat 5, Binos and ML 8850 sulphur dioxide meters kept their calibration level well. The ML 8840 nitrogen oxide meter kept its zero level well, but the measuring area varied slightly during the one week calibration period. The Sick GM 21 kept the collimation of the beam well during the measuring period. The best experiences in Finnish plants are of those obtained by continuous action oxygen and dust density metering devices. The oxygen meters have been considered accurate, but in the case of dust density meters the opinions have been scattered. There is less experience of sulphur dioxide and nitrogen oxide meters. The measurement of sulphur dioxide with both devices based on continuous sampling and in situ meters was most problematic in soda recovery boiler plants.

438 (DTH-LA–41) **Active reduction of the dominant clear tone component of the noise pollution from power plant chimneys.** Burmand Johannesson, R. Danmarks Tekniske Hoejskole, Lyngby (Denmark). Lab. for Akustik. Oct 1991. 42p. (In Danish). Order Number DE93721473. Source: OSTI; NTIS; INIS.

An investigation of a system for active reduction of an irritating dominant clear tone emitted as a part of the noise pollution from a power plant chimney is described. Experiments were carried out on a scale model with diameters 3-4 times less than the actual chimney. Reduction of 25-30 decibels was achieved in relation to the clear tone in the frequency range in connection with which it could be expected that the noise-muffling system would work. The system was also seen to be able to follow the expected variation in the noise signals and to be stable during a longer period of time. The theories on which the experiment was based, the experimental setup and measurement methods and results are presented. (AB).

440 (EUR–14363, pp. 3-9) **Decommissioning operational experience in AEA technology.** Jones, J.M. Commission of the European Communities, Luxembourg (Luxembourg). 1992. (CONF-9109441–: 2. Seminar on practical decommissioning experience with nuclear installations in the European Community, Sellafield (United Kingdom), 25-26 Sep 1991). In *Practical decommissioning experience with nuclear installations in the European Community.* 207p. Order Number DE93721081. Source: OSTI; NTIS (US Sales Only); INIS.

The UK Nuclear industry is over 40 years old with AEA Technology which has been and is involved in the decommissioning of a wide range of redundant nuclear facilities: reactors, alpha facilities and other plants. A number of different constraints affect both the level and type of decommissioning operations undertaken on redundant facilities. There is the regulatory framework within which we have to operate, the availability of decommissioning operations undertaken on redundant facilities, funding and, certainly within the UK, the availability of viable waste disposal routes.

441 (INIS-mf–13366) **Implementation of quality assurance corrective actions.** Bezpecnost Jadernych Zarizeni. Ceskoslovenska Komise pro Atomovou Energii, Prague (Czechoslovakia). 1992 95p. Translation of IAEA publication (Technical Report Series. No. 317). International Atomic Energy Agency, Vienna 1990. (In Czech). Order Number DE93605772. Source: OSTI; NTIS (US Sales Only); INIS.

In quality assurance practice, the corrective action process is often thought of as simply a mechanism for remedying a specific non-conformance. The initiation of corrective action to preclude recurrence of the non-conformance is therefore frequently overlooked. This issue has been identified as a major problem in the implementation of an effective quality assurance programme. In this connection, it may be noted that quality assurance practitioners devote about half of their time to non-conformance and corrective action activities and there is a need for more detailed guidance on this subject. The IAEA has therefore developed this Manual to serve as guidance to Member States on non-conformance and corrective actions. It offers a practical model and illustrative examples of the means by which effective measures and actions can be implemented. The scope of the Manual, while fully addressing the requirements in the governing Nuclear Safety Standards (NUSS) programme documents, also covers corrective action processes which would more generally assist users in developing good practice for improved performance in all areas of safety, reliability and economics. 2 figs.

The goal of this project is to develop a mobile teleoperated system to do the job effectively of inspection and light duty maintenance work inside the containment buildings under severe environments. This is the second year of the project. Basically remotely controlled concept was adopted to a mobile robot which was equipped with 7 degrees of freedom anthropomorphic manipulator providing dexterous control. Closed-loop schemes for solving the inverse kinematics of the redundant manipulator were investigated and decentralized adaptive controller was designed for the end effector to track the desired trajectory. A new stair climbing algorithm was proposed to go over irregular stairs, and simulations and experiments were carried out. User-friendly teleoperated control console was designed to comply with human engineering. Off-line programming technique has been developing to enhance the safety and efficiency in task assignment of robot. This research will in consequence be in a strong position to bid for further work in this area. (Author).

2101 Power Reactors, Nonbreeding, Light-Water Moderated, Boiling Water Cooled

443 (EUR–13906) **Summary of the dimensioning verification studies of the Phebus-FP experiments.** Shepherd, I.M. (Commission of the European Communities, Ispra (Italy). Joint Research Centre); Markovina, A.G. Commission of the European Communities, Luxembourg (Luxembourg). 1992. 52p. Source: OSTI; NTIS (US Sales Only); INIS.

As preparation for the Phebus-FP project a set of scoping calculations were performed in order to check how well Phebus-FP is able to represent a severe accident sequence in a light water reactor. This report summarizes those calculations that deal with the coolant circuit between the bundle and containment vessel. Many calculations were performed by many different organizations and it was found that, although there was considerable quantitative disagreement, it was possible to simulate a severe accident sequence in Phebus-FP. Recommendations are made concerning the conduct of the test and deficiencies in the codes used to calculate the phenomena are pointed out.

444 (EUR–14037) **Hydrogen in water-cooled nuclear power reactors.** Commission of the European Communities, Luxembourg (Luxembourg). 1992. 302p. Source: OSTI; NTIS (US Sales Only); INIS.

The Commission of the European Community (CEC) and the International Atomic Energy Agency (IAEA) decided in 1989 to update the state of the art concerning hydrogen in water cooled nuclear power reactors by commissioning a report which would review, all the available information to-date and make recommendations for the future. This joint report was prepared by committees formed by the IAEA and by the CEC. The aim of this report is to review the current understanding on the areas in which the research on hydrogen in LWR is conventionally presented, taking into account the results of the latest reported research developments. The main reactions through which hydrogen is produced are assessed together with their timings. An estimation of the amount of hydrogen produced by each reaction is given, in order to reckon their relative contribution to the hazard. An overview is then given of the state of knowledge of the most important phenomena taking place during its transport from the place of production and the phenomena which control the hydrogen combustion and the consequences of combustion under various conditions. Specific research work is recommended in each sector of the presented phenomena. The last topics reviewed in this report are the hydrogen detection and the prevent/mitigation of pressure and temperature loads on containment structures and structures and safety related equipment caused by hydrogen combustion.

445 (EUR–14039) **Hydrogen behaviour and mitigation in water-cooled nuclear power reactors.** Della Loggia, E. (Commission of the European Communities, Brussels (Belgium). Directorate General for Science, Research and Development). Commission of the European Communities, Luxembourg (Luxembourg). 1992. 370p. (CONF-9103264–: Proceedings of a Workshop on Hydrogen behaviour and mitigation in water-cooled nuclear power reactors, Brussels (Belgium), 4-8 Mar 1991). Source: OSTI; NTIS (US Sales Only); INIS.

The Commission of the European Communities (CEC) and the International Atomic Energy Agency (IAEA), within the framework of their safety research activities, initiated and arranged a series of specialist meetings and research contracts on hydrogen behaviour and control. The result of this work is summarized in a report jointly prepared by the two international organizations entitled 'Hydrogen in water-cooled nuclear power reactors'. Independently, the Kurchatov Atomic Energy Institute organized a workshop on the hydrogen issue in Sukhumi, USSR, with CEC and IAEA cooperation. Commonly expressed views have emerged and recommendations were formulated to organize the subsequent seminar/workshop concentrating mainly on the most recent research and analytical projects and findings related to the hydrogen behaviour, and-most importantly-on the practical approaches and engineering solutions to the hydrogen control and mitigation. The seminar/workshop, therefore, addressed the 'theory and practice' aspects of the hydrogen issue. The workshop was structured in the following sessions: combustible gas production; hydrogen distribution; combustion phenomena; combustion effects and threats; and detection and migration.

446 (EUR–14039, pp. 28-37) **Hydrogen generation during reflooding of degraded core as an accident management measure.** Hidaka, A. (Japan Atomic Energy Research Inst., Tokai, Ibaraki (Japan). Tokai Research Establishment); Sugimoto, J.; Soda, K. Commission of the European Communities, Luxembourg (Luxembourg). 1992. (CONF-9103264–: Proceedings of a Workshop on Hydrogen behaviour and mitigation in water-cooled nuclear power reactors, Brussels (Belgium), 4-8 Mar 1991). In *Hydrogen behaviour and mitigation in water-cooled nuclear power reactors.* 370p. Order Number DE93721166. Source: OSTI; NTIS (US Sales Only); INIS.

Sensitivity analyses were performed to investigate a possible hydrogen generation during reflooding of degraded core which is considered as one of severe accident management strategies. The detailed accident analysis code, RELAP/SCDAP, was used for the present analysis in which the degraded core similar to the TMI-2 accident was postulated. More over the initiation timing and the rate of core reflooding were selected as parameters of the analysis. Two cases for the steam flow, which represented realistic assumption, and steam starved flow, which corresponded to a possible case where a large part of fuel cladding remained unoxidized. From the present analyses, it was concluded that; (i) reflooding of degraded core would become additional source of hydrogen generation, (ii) an amount of hydrogen generation during reflooding depends on the amount of remaining unoxidized zirconium in the core and the timing of reflooding initiation, (iii) in general, the early injection as possible would mitigate core degradation and consequently result in less hydrogen generation.

447 (EUR–14039, pp. 50-64) **Comparisons of fathoms blind and open post-test predictions with the experimental data of HDR-H_2-mixing tests E.11.2 and E.11.4.** Wolf, L. (Battelle-Institut e.V., Frankfurt am Main (Germany)); Holzbauer, H. Commission of the European Communities, Luxembourg (Luxembourg). 1992. (CONF-9103264–: Proceedings of a Workshop on Hydrogen behaviour and mitigation in water-cooled nuclear power reactors, Brussels (Belgium), 4-8 Mar 1991). In *Hydrogen behaviour and mitigation in water-cooled nuclear power reactors.* 370p. Order Number DE93721166. Source: OSTI; NTIS (US Sales Only); INIS.

Battelle-Institut e.V., Frankfurt, FRG, participated with the containment analysis code FATHOMS, Version 2.3, in the blind post-test computational PHDR-Benchmark Exercise on the HDR

long-term hydrogen mixing experiments E11.2 and E11.4. Quantitative results are shown in comparison with various data of both experiments. The levels of agreement for the different physical quantities are presented in detail and potential causes for deviations are discussed. Upon completion of the exercises, it became known that the insulation of the instrumentation cooling lines had deteriorated thus providing a substantial heat sink. This fact led to rather high overpredictions by all participants. Its effect has been accounted for by an open post-test FATHOMS computation the results of which are compared to those of the blind computations and the data.

448 (EUR–14039, pp. 74-80) **Three dimensional numerical simulation of hydrogen distribution and mixing in containment.** Barthel, V. (CEA Centre d'Etudes de Grenoble, 38 (France)); Grand, D.; Villand, M. Commission of the European Communities, Luxembourg (Luxembourg). 1992. (CONF-9103264–: Proceedings of a Workshop on Hydrogen behaviour and mitigation in water-cooled nuclear power reactors, Brussels (Belgium), 4-8 Mar 1991). In *Hydrogen behaviour and mitigation in water-cooled nuclear power reactors.* 370p. Order Number DE93721166. Source: OSTI; NTIS (US Sales Only); INIS.

This paper describes the adaptation of the three dimensional thermal-hydraulic code TRIO-VF to the study of hydrogen distribution throughout the containment during severe accident sequences. The original version of the code has been adapted to compressible fluid flows that can be mixtures of one to four constituents, one being water steam, the others gas components (air, H2,...). The mass conservation equations of the different constituents, the motion and energy conservation equations are strongly coupled. The turbulent (k-ϵ) model is used where transport equations of k and ϵ are considered. A wall condensation model has been introduced in order to take into account the influence of the film resistance along the wall. The different equations and models governing the fluid flow are presented. Some validation cases that have already been realized are described. A general validation case on one HDR experiment will soon be defined and calculated with the new adapted TRIO-VF code.

449 (EUR–14039, pp. 81-95) **Results of the PHDR computational Benchmark exercises on hydrogen distribution experiments E11.2 and E11.4.** Wolf, L. (Battelle-Institut e.V., Frankfurt am Main (Germany)); Valencia, L. Commission of the European Communities, Luxembourg (Luxembourg). 1992. (CONF-9103264–: Proceedings of a Workshop on Hydrogen behaviour and mitigation in water-cooled nuclear power reactors, Brussels (Belgium), 4-8 Mar 1991). In *Hydrogen behaviour and mitigation in water-cooled nuclear power reactors.* 370p. Order Number DE93721166. Source: OSTI; NTIS (US Sales Only); INIS.

International computational results of blind post-test computations for the HDR-hydrogen mixing experiments E11.2 and E11.4 are qualitatively compared with measured data. All well-known containment analyses codes participated in the PHDR-Benchmark Exercises which covered a number of various break and injection positions and also encompassed different elements of accident management measures such as outside and inside sprays. Potential causes for the observed differences between data and predictions are presented, both with respect to the provided input data as well as the modeling features chosen. The paper supplements the detailed informations about the experiments by adding the containment code verification aspects.

450 (EUR–14039, pp. 141-150) **Experimental results and modelling strategies for multi-compartment hydrogen deflagration.** Kanzleiter, T.F. (Battelle-Institut e.V., Frankfurt am Main (Germany)); Fischer, K.; Wennerberg, D. Commission of the European Communities, Luxembourg (Luxembourg). 1992. (CONF-9103264–: Proceedings of a Workshop on Hydrogen behaviour and mitigation in water-cooled nuclear power reactors, Brussels (Belgium), 4-8 Mar 1991). In *Hydrogen behaviour and mitigation in water-cooled nuclear power reactors.* 370p. Order Number DE93721166. Source: OSTI; NTIS (US Sales Only); INIS.

Recent large-scale experiments on hydrogen deflagration in multi-compartment geometries have shown considerable flame accelerations and pressure build-ups much higher than expected from the results of single-compartment experiments in the same concentration range. In a number of parametric studies, the various factors determining the flame propagation behavior were investigated. Modelling these processes in a lumped-parameter approximation is severely limited because of a lack of detailed geometric representation, while a distributed-parameter approximation is difficult to establish for realistic LWR containment geometries. The present paper shows that a combined modelling approach is able to resolve this problem, leading to a predictive mechanistic model for hydrogen deflagration events with practical relevance.

451 (EUR–14039, pp. 151-160) **Two models of hydrogen combustion in a closed cylinder.** Tiselj, I. (Institut Jozef Stefan, Ljubljana (Slovenia)); Kodre, A.; Mavko, B. Commission of the European Communities, Luxembourg (Luxembourg). 1992. (CONF-9103264–: Proceedings of a Workshop on Hydrogen behaviour and mitigation in water-cooled nuclear power reactors, Brussels (Belgium), 4-8 Mar 1991). In *Hydrogen behaviour and mitigation in water-cooled nuclear power reactors.* 370p. Order Number DE93721166. Source: OSTI; NTIS (US Sales Only); INIS.

Combustion of non-detonating air-hydrogen mixture in a cylindrical vessel is modelled by the full Navier-Stokes system of differential equations. Effects of turbulence are taken into account by phenomenological turbulent transport coefficients, chemical kinetics of the reaction is described by a single activation term. Good agreement with previously published data can be obtained by adjustment of boundary conditions at the vessel walls. A more efficient model, based on the incompressible-fluid approximation is developed and tested.

452 (EUR–14039, pp. 161-172) **Criteria for transition to detonation for hydrogen flames.** Chan, C.K. (Atomic Energy of Canada Ltd., Pinawa, MB (Canada). Whiteshell Nuclear Research Establishment). Commission of the European Communities, Luxembourg (Luxembourg). 1992. (CONF-9103264–: Proceedings of a Workshop on Hydrogen behaviour and mitigation in water-cooled nuclear power reactors, Brussels (Belgium), 4-8 Mar 1991). In *Hydrogen behaviour and mitigation in water-cooled nuclear power reactors.* 370p. Order Number DE93721166. Source: OSTI; NTIS (US Sales Only); INIS.

During postulated loss-of-coolant accidents in a nuclear power reactor, the H_2 generated from a metal/steam reaction may leak into the containment building and form a combustible atmosphere. If the gas mixture is ignited, the potential damage to the containment building and equipment within the containment depends on whether the combustion is a deflagration or a detonation. Direct initiation of detonation requires a high-energy initiation source such as a solid explosive. Such a source is not likely to be present in a containment environment. However, a detonation can occur via a deflagration-to-detonation transition (DDT). At the present time, the necessary conditions (or the criteria) for a DDT to occur have not been determined. It is not possible to predict a priori whether a transition can occur in a given situation. Recently, a few qualitative methods were proposed to assess the likelihood of a DDT. This paper reviews the current understanding of the transition phenomenon, and discusses the qualitative methods available for assessing the likelihood of a DDT. It briefly describes a recent study on turbulent/flame interaction to establish one of the necessary conditions for a DDT to occur. A new methodology for assessing DDT is also proposed to remove some of the conservatism that prevails in the other approaches.

453 (EUR–14039, pp. 173-183) **Mechano-chemical model of breakaway zirconium oxidation.** Fridman, A.A. (Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Moscow (Russian Federation). Inst. Atomnoj Ehnergii); Kirillov, I.A.; Rusanov, V.D. Commission of the European Communities, Luxembourg (Luxembourg). 1992. (CONF-9103264–: Proceedings of a Workshop on Hydrogen behaviour and mitigation in water-cooled nuclear power reactors, Brussels (Belgium), 4-8 Mar 1991). In *Hydrogen behaviour and mitigation in water-cooled nuclear power reactors.* 370p. Order Number DE93721166. Source: OSTI; NTIS (US Sales Only); INIS.

In order to make clear the long-term oxidation kinetics of steam-zirconium topochemical reaction and fuel cladding behavior under severe accident conditions the breakaway oxidation phenomenon have been considered. Autowave model of breakaway oxidation

have been developed. It has been proposed in this model that diffusion propagation of oxidation front is autocatalyzed by the oxide layer degradation. Within the frame work of the macroscopic model of quasi-brittle oxide layer fracture the analytical dependence of the breakaway oxidation rate coefficient, barrier layer thickness and characteristic crack length upon temperature and mechanochemical oxide parameters have been obtained. Comparison of theoretical calculations with existing experimental data have shown a good agreement. Proposed theoretical framework and models can be used in computer simulations and analytical assessment of the hydrogen generation, core heat-up and cladding embrittlement in severe fuel damage accidents conditions.

454 (EUR–14039, pp. 196-201) **Proving test on the reliability for reactor containment vessel (2) hydrogen burning test.** Takumi, K. (Nuclear Power Engineering Workshop, Tokyo (Japan)); Nonaka, A.; Ogata, J.; Moriya, K. Commission of the European Communities, Luxembourg (Luxembourg). 1992. (CONF-9103264–: Proceedings of a Workshop on Hydrogen behaviour and mitigation in water-cooled nuclear power reactors, Brussels (Belgium), 4-8 Mar 1991). In *Hydrogen behaviour and mitigation in water-cooled nuclear power reactors.* 370p. Order Number DE93721166. Source: OSTI; NTIS (US Sales Only); INIS.

Hydrogen burning test has been performed at Katsuta Engineering Laboratory of NUPEC. Some of the test results show good accordance with the previous data at SNL/FITS.

455 (EUR–14039, pp. 208-214) **Electrochemical devices for hydrogen concentration and pH measurements in the coolant of water-cooled reactors.** Vakar, M. (Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Moscow (Russian Federation). Inst. Atomnoj Ehnergii); Pakhomov, V. Commission of the European Communities, Luxembourg (Luxembourg). 1992. (CONF-9103264–: Proceedings of a Workshop on Hydrogen behaviour and mitigation in water-cooled nuclear power reactors, Brussels (Belgium), 4-8 Mar 1991). In *Hydrogen behaviour and mitigation in water-cooled nuclear power reactors.* 370p. Order Number DE93721166. Source: OSTI; NTIS (US Sales Only); INIS.

In spite of the fact that much attention, has been always paid on hydrogen safety of water-cooled reactors, accidents caused by explosions of hydrogen-oxygen mixtures accompany atomic energy through its history. Water radiolysis being an inherent property of a water-cooled reactor continuously sustains a possibility for dangerous situations at a nuclear power plant (NPP). The explosion even of a small amount of hydrogen can lead to a severe accident. It seems that today there is no real possibility to develop universal tools able to provide hydrogen safety at NPPs including normal operation and various accidents. However rather sophisticated systems for hydrogen monitoring and maintaining proper parameters of primary coolant circuit can be developed. The studies indicate that based on the similar type of electrochemical technique it is possible to create the system of complete monitoring of a coolant's state and its interaction with inner surfaces of the circuit. Measurements of hydrogen and oxygen concentration and pH play the most important role here and can solve practically all problems in coolant-core interaction.

456 (EUR–14039, pp. 247-260) **EPRI research on hydrogen combustion and control.** Haugh, J.J. (Electric Power Research Inst., Palo Alto, CA (United States)); Hosler, J.F.; Sliter, G.E.; Torok, R.C.; Wall, I.B. Commission of the European Communities, Luxembourg (Luxembourg). 1992. (CONF-9103264–: Proceedings of a Workshop on Hydrogen behaviour and mitigation in water-cooled nuclear power reactors, Brussels (Belgium), 4-8 Mar 1991). In *Hydrogen behaviour and mitigation in water-cooled nuclear power reactors.* 370p. Order Number DE93721166. Source: OSTI; NTIS (US Sales Only); INIS.

For several years, the nuclear industry has been concerned by the potential for hydrogen-air-steam mixtures to ignite and expose the containment and safety-related equipment to severe conditions. EPRI has executed a comprehensive program of experiments on hydrogen mixing and combustion, and equipment survivability and has demonstrated that deliberate ignition can control hydrogen during severe accidents and that safety-related equipment, satisfying USNRC criteria, has a high likelihood of remaining operable when exposed to such burns. The results have been used to benchmark new computer models for hydrogen mixing and combustion.

457 (EUR–14159) **The assessment of containment codes by experiments simulating severe accident scenarios.** Karwat, H. (Technische Univ. Muenchen (Germany)). Commission of the European Communities, Luxembourg (Luxembourg). 1992. 63p. Contract ETSN-0044-D(CH). Source: OSTI; NTIS (US Sales Only); INIS.

Hitherto, a generally applicable validation matrix for codes simulating the containment behaviour under severe accident conditions did not exist. Past code applications have shown that most problems may be traced back to inaccurate thermalhydraulic parameters governing gas- or aerosol-distribution events. A provisional code-validation matrix is proposed, based on a careful selection of containment experiments performed during recent years in relevant test facilities under various operating conditions. The matrix focuses on the thermalhydraulic aspects of the containment behaviour after severe accidents as a first important step. It may be supplemented in the future by additional suitable tests.

458 (EUR–14230) **A review of radionuclide release and transport in recent in-pile experiments.** Harman, N.F. (UKAEA Safety and Reliability Directorate, Culcheth (United Kingdom)); Clough, P.N. Commission of the European Communities, Luxembourg (Luxembourg). 1992. 115p. Contract ETNU-0018. Source: OSTI; NTIS (US Sales Only); INIS.

The experimental series, reviewed in this work, are LOFT-LP-FP-2, PBF SFD ST to 1-4, Treat/STEP I to 4, and ACRR ST-1 and ST-2. These have the common features of in-core heating of a test fuel bundle to high temperatures (usually with some fuel melting) in an experimental reactor core, and of collecting and analysing the released fission products. They were designed to provide detailed information on the release from fuel of fission products and other radionuclides under LWR severe accident conditions, and on the chemical and physical forms and transport of the fission products. The main aim of this review is to bring together, in a systematic way, information on the conduct of the tests, on their successes and failures, and particularly on the information they generated on the chemical and physical behaviour of released fission products. By examining and analysing the data from all of the tests together, patterns of fission product behaviour may become apparent and insights may be gained, which would not be arrived at from individual test results. Moreover, important lessons may be learned, and useful guidance obtained, relating to the aims and conduct of future experimental programmes of fission product release from fuel and transport behaviour. The conclusions should be particularly relevant to the imminent Phebus-FP in-pile test series at Cadarache.

459 (EUR–14363, pp. 37-45) **Pilot dismantling of the KRB A BWR at Gundremmingen. Phase 1 - Dismantling of contaminated and activated components.** Eickelpasch, N. (Kernkraftwerk-Betriebsgesellschaft mbH, Eggenstein-Leopoldshafen (Germany)); Stang, W.; Steiner, H. Commission of the European Communities, Luxembourg (Luxembourg). 1992. (CONF-9109441–: 2. Seminar on practical decommissioning experience with nuclear installations in the European Community, Sellafield (United Kingdom), 25-26 Sep 1991). In *Practical decommissioning experience with nuclear installations in the European Community.* 207p. Order Number DE93721081. Source: OSTI; NTIS (US Sales Only); INIS.

The nuclear power station Gundremmingen unit A (KRBA) was built from 1962 to 1966 as the first of three demonstration nuclear power stations in the Federal Republic of Germany and had an electrical output of 250 MW. In January 1977, the facility was placed out of operation due to an incident. In early 1980 it was decided to decommission the facility. The turbine building has been emptied by dismantling 4000 Mg of steel and concrete from 1983 until 1989. During the passed year the main decommissioning activities at the KRB plant have been: - dismantling and recycling of contaminated components in the reactor building - disassembly engineering of the reactor pressure vessel (RPV) and internals - development and test of special techniques, tools and machinery for decommissioning. All this dismantling works are covered by the

decommissioning license of 1983 and its supplement of 1989. Dismantling of the neutron-activated RPV internals and the biological shield are not yet licensed.

460 (INIS-mf–13348, pp. 11-14) **Overview of work on improving existing LWR core designs and developments for reactors of the next generation.** Abu-Zaied, G. (Paul Scherrer Inst. (PSI), Villigen (Switzerland)); Brogli, R. Paul Scherrer Inst. (PSI), Villigen (Switzerland). 1992. 74p. In *Paul Scherrer Institut annual report 1991: Annex IV: PSI nuclear energy research. Progress report 1991.* Order Number DE93000807. Source: OSTI; NTIS; INIS.

There is an interest in improving current reactors through minor and localized modifications to reactor system components. Improved safety and performance for current and future reactors is the main goal. The underlying motivation is to maintain the option for nuclear power in the future. It can be seen that significant improvements are potentially available through relatively minor modifications. Specific areas for improvement and an illustrative example are discussed in this paper. In this specific example, external assembly bypass water (an important moderator) was adjusted during normal operation to keep the reactor critical at hot full-power. It has been found that a reduction of about 10% in assembly average enrichment is achievable. Neither gadolinium nor control rods need to be used during normal operation. Reactivity coefficients (negativity) are increased. Great operational flexibility and core performance are promised but at the cost of a more complex control rod drive mechanism. (author) 2 figs., 7 refs.

461 (NUREG/CR–6003) **Density-wave instabilities in boiling water reactors.** March-Leuba, J. (Oak Ridge National Lab., TN (United States)). Nuclear Regulatory Commission, Washington, DC (United States). Div. of Systems Technology; Oak Ridge National Lab., TN (United States). Sep 1992. 45p. Sponsored by Nuclear Regulatory Commission, Washington, DC (United States). DOE Contract AC05-84OR21400. (ORNL/TM–12130). Source: OSTI; NTIS; INIS; GPO.

This report contains a review of issues related to density-wave instabilities in boiling water reactors (BWRs). The report describes the types of instability modes that can be expected in operating reactors; these modes are: the channel thermohydraulic instability mode, the core-wide instability mode, and the out-of-phase instability mode. The physical mechanisms leading to each type of instability are reviewed and documented, along with some common mathematical models used in stability calculations is reviewed. The linear behavior of a BWR is studied through the use of transfer functions, and the nonlinear behavior and limit cycle development are studied. A summary of the sensitivities to physical parameters is also included in this report.

462 (VTT-TIED–1322) **Analysis of failure and maintenance experiences of motor operated valves in a Finnish nuclear power plant.** Simola, K. (Technical Research Centre of Finland, Espoo (Finland). Lab. of Electrical and Automation Engineering); Laakso, K. Technical Research Centre of Finland, Espoo (Finland). Jan 1992. 199p. Order Number DE93605780. Source: OSTI; NTIS; INIS.

Operating experiences from 1981 up to 1989 of totally 104 motor operated closing valves (MOV) in different safety systems at TVO I and II nuclear power units were analysed in a systematic way. The qualitative methods used were failure mode and effects analysis (FMEA) and maintenance effects and criticality analysis (MECA). The failure descriptions were obtained from power plant's computerized failure reporting system. The reported 181 failure events were reanalysed and sorted according to specific classifications developed for the MOV function. Filled FMEA and MECA sheets on individual valves were stored in a microcomputer data base for further analyses. Analyses were performed for the failed mechanical and electrical valve parts, ways of detection of failure modes, failure effects, and repair and unavailability times.

463 (AECL–10390) **Synergistic CANDU-LWR fuel cycles.** Hastings, I.J. (Atomic Energy of Canada Ltd., Chalk River, ON (Canada). Chalk River Nuclear Labs.); Boczar, P.G.; Allan, C.J.; Gacesa, M. Atomic Energy of Canada Ltd., Chalk River, ON (Canada). Chalk River Nuclear Labs. May 1991. 12p. (CONF-9104386–: 6. Korea Atomic Industrial Forum/Korea Nuclear Society (KAIF/KNS) joint annual conference, Seoul (Korea, Republic of), 15 Apr 1991). Order Number DE93603864. Source: OSTI; NTIS (US Sales Only); INIS.

CANDU is the most neutron-efficient reactor available commercially, allowing utilization of a range of fuel cycles. The flexibility of on-line refuelling allows fuel management to accommodate these different fuels. A synergism with light-water reactors (LWR) is possible through the use in CANDU of uranium and/or plutonium recovered from spent LWR fuel. In the TANDEM fuel cycle, the unseparated uranium and plutonium (1.5% fissile) would give a burnup in CANDU of about 25 MW.d/kg HE, producing four times more energy than that available from simply recycling the plutonium in an LWR. In another potential fuel cycle, uranium recovered from spent LWR fuel during conventional reprocessing is also recycled in CANDU, without re-enrichment. An average recovered uranium (RU) enrichment of 0.9% in U-235 results in a CANDU burnup of at least 13 MW.d/kg U, allowing twice as much energy to be extracted, compared with that from an LWR. The fuelling cost for RU in CANDU are about 35% lower than for natural uranium. Additionally, direct use of spent LWR fuel in CANDU is theoretically possible, but requires practical demonstration. AECL and KAERI are developing the CANFLEX (CANDU Flexible Fuelling) advanced fuel bundle as the optimal carrier for all extended burnup fuel cycles envisaged for CANDU.

464 (CEA-CONF–10942) **Decision aid systems for nuclear reactors.** Evrard, J.M.; Martinez, J.M. CEA Centre d'Etudes de Saclay, 91 - Gif-sur-Yvette (France). Dept. de Mecanique et de Technologie. 1992. 9p. (In French). (CONF-9203196–: INFAUTON 92: Operational expert systems, Toulouse (France), 12-13 Mar 1992). Order Number DE93721162. Source: OSTI; NTIS (US Sales Only); INIS.

The development of new techniques, especially in the field of artificial intelligence, makes it possible to design more powerful computerized systems, supporting tasks related to the design and operation of nuclear power plants. The potential contribution and perspectives for the integration of such systems depend upon whether the improvement of existing plants, the design of next generation reactors or future projects are concerned. We present four systems which show the state-of-the-art as regards knowledge-based systems. The first system is related to the automatic generation of procedures dealing with loss of electrical sources. The second one aims at assisting the power plant utility in following the technical specifications during maintenance operations. Finally, the last two are designed to help an emergency team evaluate and forecast the evolution of an accidental situation in a nuclear reactor. Perspectives for on-line operator assistance are then discussed, as well as the main technical themes which will make it possible to design such systems. We conclude with the difficulties which are encountered upon the integration of these tools: their validation and task sharing between man and machine.

465 (CEA-CONF–10968) **Three basic options for the management of PWR waste.** Malherbe, J. (CEA Centre d'Etudes de la Vallee du Rhone, 30 - Marcoule (France). Dept. des Procedes de Retraitement); Santraille, S.; Saulieu, E. de; Glibert, R.; Alamo Berna, S.; Cecille, L.; Geiser, H.; Kowa, S.; Thiels, G. CEA Centre d'Etudes de la Vallee du Rhone, 30 - Marcoule (France). Dept. des Procedes de Retraitement. 1990. 14p. (CONF-9009208–: 3. European community conference on radioactive waste management and disposal, Luxembourg (Luxembourg), 17-21 Sep 1990). Order Number DE93721211. Source: OSTI; NTIS (US Sales Only); INIS.

Relying on the national practices of France, Germany and Belgium, three reference management routes for PWR wastes were drawn up and subsequently evaluated in terms of costs and radiological impact. It was thus demonstrated that safety regulations and technical redundancies, especially for off-gas treatment, liquid waste processing and dry solid waste treatment, play an important part in the cost associated with each route. The analysis of the different treatment options for mixed solid low level waste highlighted the low cost effectiveness of incineration as compared to compaction. Whatever the scenario investigated, the disposal costs of PWR wastes proved to be quite marginal in the overall cost. The radiological impact associated with each route was assessed through individual doses resulting from liquid and gaseous effluents. This theoretical exercise included some sensitivity studies performed on a selection of important parameters.

466 (CONF-9210173–1) **Needs for evaluated covariance data for reactor pressure vessel dosimetry.** Maerker, R.E. (Oak Ridge National Lab., TN (United States)); Broadhead, B.L.; Wagschal, J.J. Oak Ridge National Lab., TN (United States). [1992]. 21p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From Nuclear Energy Agency Science Committee (NEANSC) specialists meeting on evaluation and processing of covariance data; Oak Ridge, TN (United States); 7-9 Oct 1992. Order Number DE93000452. Source: OSTI; NTIS; INIS; GPO Dep.

This report discusses new methodology for quantifying and then reducing uncertainties in the calculated pressure vessel fluences of a pressurized water reactor (PWR). The technique involves combining the integral results of the calculated and measured PWR surveillance dosimetry activities with the differential data used in the calculations, along with covariances of all the quantities, into a generalized linear least-squares adjustment procedure. Based on analysis of both PWRs and test reactor benchmarks, substantial evidence now exists to support the conclusion that, of all the nuclear as well as non-nuclear differential data considered, ENDF/B-VI values of the total inelastic iron cross sections and their covariances are the most important data controlling the outcome of the adjustment procedure. Predicted adjustments in these cross sections provided the stimulus for new measurements, the results of which impacted the ENDF/B-VI evaluation of iron 56.

467 (DOE/ER/12809–2) **The slightly-enriched spectral shift control reactor: Progress report, June 1, 1989–May 31, 1990.** Martin, W.R. (Michigan Univ., Ann Arbor, MI (United States). Dept. of Nuclear Engineering); Lee, J.C.; Edlund, M.C. Michigan Univ., Ann Arbor, MI (United States). Dept. of Nuclear Engineering. Jun 1990. 62p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG07-88ER12809. Order Number DE92040987. Source: OSTI; NTIS; INIS; GPO Dep.

An advanced converter reactor design utilizing mechanical spectral shift control rods in a conventional pressurized water reactor configuration is under investigation. The design is based on the principle that a harder spectrum during the early part of the fuel cycle will result in larger neutron captures in fertile ^{238}U, which can then be burned in situ in a softer spectrum later in the cycle. Preliminary design calculations performed during FY 89 show that the slightly-enriched spectral shift reactor design offers the benefit of substantially increased fuel resource utilization with the proven safety characteristics of the pressurized water reactor technology retained. Optimization of the fuel design and development of fuel management strategies have been carried out in FY 90, along with effort to develop and validate neutronic methodology for tight-lattice configurations with hard spectra. During FY 91, the final year of the grant, effort will focus on performing the final design calculations and continuing the research to develop improved methods for tight lattice analysis.

468 (EUR–14039, pp. 16-27) **Hydrogen production limits under PWR degraded core conditions: the status of current modelling capabilities and plant predictions.** Lillington, J.N. (UKAEA Atomic Energy Establishment, Winfrith (United Kingdom)). Commission of the European Communities, Luxembourg (Luxembourg). 1992. (CONF-9103264–: Proceedings of a Workshop on Hydrogen behaviour and mitigation in water-cooled nuclear power reactors, Brussels (Belgium), 4-8 Mar 1991). In *Hydrogen behaviour and mitigation in water-cooled nuclear power reactors.* 370p. Order Number DE93721166. Source: OSTI; NTIS (US Sales Only); INIS.

This paper gives the state-of-the-art knowledge on early phase hydrogen production during in-vessel core heat-up. The key phenomena affecting hydrogen production are discussed, together with the status of current modelling capabilities. Predictions from selected plant calculations are given, ranging from code calculations incorporating simple models (e.g. 1-D thermal-hydraulics, non-mechanistic melt progression) through to code calculations incorporating the latest detailed models (natural circulation, mechanistic melt progression). Much of the analysis carried out to date has been for intact circuit transients. Although, in this paper, emphasis is placed on this scenario, other sequences are also briefly mentioned. The main conclusions are that among the code calculations there is reasonable agreement on the percentage of Zircaloy reacted prior to cladding melting and relocation, typically 10-20% of the available Zircaloy. Predictions of the total Zircaloy reacted in-vessel typically vary in the range 25-50%. The differences between the extremes, are largely due to modelling assumptions made on melt progression and steam diversion at the blockage.

469 (EUR–14039, pp. 38-49) **Experimental results of the large-scale HDR hydrogen-mixing experiments E11.2 and E11.4.** Valencia, L.A. (Kernforschungszentrum Karlsruhe GmbH (Germany)); Wolf, L. Commission of the European Communities, Luxembourg (Luxembourg). 1992. (CONF-9103264–: Proceedings of a Workshop on Hydrogen behaviour and mitigation in water-cooled nuclear power reactors, Brussels (Belgium), 4-8 Mar 1991). In *Hydrogen behaviour and mitigation in water-cooled nuclear power reactors.* 370p. Order Number DE93721166. Source: OSTI; NTIS (US Sales Only); INIS.

The E11 tests series covered a combination of important issues dominating the physical phenomena controlling the hydrogen distribution mechanisms, namely: large-scale, multi-compartment, geometry with large-sized dome volume, high gas release rates, multiple steam and gas injection phases at different axial positions and examinations of the efficiencies of mitigative system features including the impact of external sprays at the top of the dome.

470 (EUR–14039, pp. 65-73) **Hydrogen distribution experiments for Loviisa ice condenser containment.** Hongisto, O. (Imatran Voima Oy (IVO), Helsinki (Finland)); Tuomisto, H.; Lundstroem, P. Commission of the European Communities, Luxembourg (Luxembourg). 1992. (CONF-9103264–: Proceedings of a Workshop on Hydrogen behaviour and mitigation in water-cooled nuclear power reactors, Brussels (Belgium), 4-8 Mar 1991). In *Hydrogen behaviour and mitigation in water-cooled nuclear power reactors.* 370p. Order Number DE93721166. Source: OSTI; NTIS (US Sales Only); INIS.

An experimental facility has been constructed for studying the Loviisa ice condenser containment thermal-hydraulics during small-break LOCAs and severe accidents. The facility is a scale model of the Loviisa containment with linear scaling 1:15 and volume scaling 1:3375. The experimental program includes three phases: influence of the ice condenser on the containment behavior during SBLOCAs, long-term behavior of the facility during small steam releases, and hydrogen distribution during core degradation accidents. Experiments have been started in December 1990. The results of preliminary experiments already indicate that stratification and separation phenomena will have a significant contribution to the hydrogen distribution.

471 (EUR–14039, pp. 96-101) **Proving test on the reliability for reactor containment vessel hydrogen mixing and distribution test.** Takumi, K. (Nuclear Power Engineering Workshop, Tokyo (Japan)); Nonaka, A.; Ogata, J.; Moriya, K. Commission of the European Communities, Luxembourg (Luxembourg). 1992. In *Hydrogen behaviour and mitigation in water-cooled nuclear power reactors.* 370p. Order Number DE93721166. Source: OSTI; NTIS (US Sales Only); INIS.

Hydrogen mixing and distribution test has been performed at Tadotsu Engineering Laboratory of NUPEC. Some of the test results show that hydrogen is well mixed generally in a containment vessel.

472 (EUR–14039, pp. 102-113) **Use of the Jericho code for the assessment of thermalhydraulics and hydrogen behaviour in nuclear power plant containment.** L'Heriteau, J.P. (CEA Centre d'Etudes de Fontenay-aux-Roses, 92 (France)). Commission of the European Communities, Luxembourg (Luxembourg). 1992. (CONF-9103264–: Proceedings of a Workshop on Hydrogen behaviour and mitigation in water-cooled nuclear power reactors, Brussels (Belgium), 4-8 Mar 1991). In *Hydrogen behaviour and mitigation in water-cooled nuclear power reactors.* 370p. Order Number DE93721166. Source: OSTI; NTIS (US Sales Only); INIS.

This paper describes the JERICHO code and gives examples of its use in term of analysis of hydrogen behaviour in large dry PWR containments. The first part gives a brief description of physical models linked to hydrogen behaviour, the second part gives the principal results obtained with the JERICHO code in the benchmark exercise DEMONA F2 sponsored by the CEE; the last part is focused on the problem of postinerting a large dry 900 MWe type containment.

473 (EUR–14039, pp. 202-206) **Hydrogen mitigation technical means of nuclear power plants.** Baronov, G.S. (Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Moscow (Russian Federation). Inst. Atomnoj Ehnergii); Davidov, Y.G.; Ershov, D.E.; Furkasov, D.E.; Kalinnikov, A.A.; Keller, V.D. Commission of the European Communities, Luxembourg (Luxembourg). 1992. (CONF-9103264–: Proceedings of a Workshop on Hydrogen behaviour and mitigation in water-cooled nuclear power reactors, Brussels (Belgium), 4-8 Mar 1991). In *Hydrogen behaviour and mitigation in water-cooled nuclear power reactors.* 370p. Order Number DE93721166. Source: OSTI; NTIS (US Sales Only); INIS.

Concept of employment on light water reactor hydrogen mitigation system, which include hydrogen sensors and recombiners, are considered. Principles of modified thermocatalytical hydrogen sensor is described. It can function in a wide temperature and pressure range and at considerable variation of analyzed mixture composition, including hydrogen, steam, helium, air. Modification of hydrogen recombiner, based on platinum activated high porosity cell materials (HPCM), is investigated by experimentally and theoretically. High penetracity and sufficiently developed surface of HPCM allow to use the natural convection for effective hydrogen recombination by sufficiently small volumes of HPCM. Recombiner design and peculiarity of physical-chemical processes inside recombiner cause security against detonation initiation.

474 (EUR–14039, pp. 224-239) **Mitigation of hydrogen threats to large dry containments (German approach).** Rohde, J. (Gesellschaft fuer Reaktorsicherheit mbH (GRS), Koeln (Germany)); Chakraborty, A.K.; Huettermann, B. Commission of the European Communities, Luxembourg (Luxembourg). 1992. (CONF-9103264–: Proceedings of a Workshop on Hydrogen behaviour and mitigation in water-cooled nuclear power reactors, Brussels (Belgium), 4-8 Mar 1991). In *Hydrogen behaviour and mitigation in water-cooled nuclear power reactors.* 370p. Order Number DE93721166. Source: OSTI; NTIS (US Sales Only); INIS.

A large amount of hydrogen is expected to be released within a large dry containment of a PWR shortly after the onset of a core melt accident. At first, the relevant accident scenarios leading to core melt and the probability of their occurrences have been discussed. Calculations of the hydrogen generation due to zircaloy-steam reaction and the reaction of molten core material with concrete and the local and global gasdistribution have revealed that the hydrogen concentration can enrich locally to an extent to pose a threat to the integrity of the containment. Several concepts of mitigation have been developed to limit the hydrogen concentrations and the use of deliberate ignition as well as of catalytic removal of hydrogen have been mainly addressed in this paper. In order to derive the maximum advantages of removing hydrogen a combined application of both using deliberate ignition and catalytic removal has been contemplated as 'dual-concept'. Finally the present status of counter measures in the FRG against this threat has also been reviewed.

475 (EUR–14039, pp. 261-273) **Critical review on hydrogen mitigation by ignitors for large dry PWR containments.** Karwat, H. (Technische Univ. Muenchen (Germany). Lehrstuhl fuer Reaktordynamik und Reaktorsicherheit). Commission of the European Communities, Luxembourg (Luxembourg). 1992. (CONF-9103264–: Proceedings of a Workshop on Hydrogen behaviour and mitigation in water-cooled nuclear power reactors, Brussels (Belgium), 4-8 Mar 1991). In *Hydrogen behaviour and mitigation in water-cooled nuclear power reactors.* 370p. Order Number DE93721166. Source: OSTI; NTIS (US Sales Only); INIS.

Hydrogen release during severe accidents poses a serious threat to the containment integrity. Mitigating procedures are necessary to prevent global or local explosions, in particular for large dry steel shell containments. A number of unresolved problems exist presently not allowing a credible prediction of the benefit of the installation of ignitors proposed for some containments. Neither are hydrogen generation rates nor the gas distribution on or the combustion processes predictable with reasonable reliability to prove the benefits and/or exclude negative consequences of the application of ignitors.

476 (EUR–14039, pp. 297-304) **Catalytic recombination systems for severe accidents and noised-induced ignition to detonation transition effect.** Kirillov, I.A. (Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Moscow (Russian Federation). Inst. Atomnoj Ehnergii); Rusanov, V.D.; Fridman, A.A. Commission of the European Communities, Luxembourg (Luxembourg). 1992. (CONF-9103264–: Proceedings of a Workshop on Hydrogen behaviour and mitigation in water-cooled nuclear power reactors, Brussels (Belgium), 4-8 Mar 1991). In *Hydrogen behaviour and mitigation in water-cooled nuclear power reactors.* 370p. Order Number DE93721166. Source: OSTI; NTIS (US Sales Only); INIS.

Contemporary deliberate ignition systems (DIS) for hydrogen removal out of containment have several intrinsic drawbacks and weakness. In order to avoid these difficulties the physical principles of the controlled recombination systems (CRS), oriented to achieve the 'inherent safety' level, were formulated. It was proposed for the elaboration of the prototype of CRS to use a catalytic recombiners (on either porous or compact supports), whose structure on macroscopic level provides spatially uniform hydrogen recombination inside containment and on mesoscopic level excludes the transition from recombination to ignition regime. Special attention is focused on safety operation of the hydrogen mitigation scheme in post-accident containment atmosphere. It was shown that the modulational instability of the small amplitude external disturbances in a sufficiently extended initially homogeneous induction zone can result in formation of the 'hot spots'. A minimal threshold value of induction zone size and its dependence on temperature disturbances was evaluated. Onset and evolution of a weak discontinuity in a spontaneous propagation of chemical reaction zone was investigated analytically. Criterion for a shock wave formation was received. It is emphasized that scaling of hydrogen catalytic recombination systems (both under development and any advanced) should be done with taking into account the different mechanisms of spontaneous transition to detonation, induced by small amplitude disturbances in the distributed induction zone.

477 (EUR–14039, pp. 324-332) **Some aspects of hydrogen catalytic recombiner operation under severe accident conditions.** Grigoriev, S. (Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Moscow (Russian Federation). Inst. Atomnoj Ehnergii); Davidov, Y.; Stolyarova, G.; Khodulev, L. Commission of the European Communities, Luxembourg (Luxembourg). 1992. (CONF-9103264–: Proceedings of a Workshop on Hydrogen behaviour and mitigation in water-cooled nuclear power reactors, Brussels (Belgium), 4-8 Mar 1991). In *Hydrogen behaviour and mitigation in water-cooled nuclear power reactors.* 370p. Order Number DE93721166. Source: OSTI; NTIS (US Sales Only); INIS.

The paper is addressed to the problem of operation of hydrogen catalytic recombiner based on high-porosity cell material under severe accident conditions at NPP with a nuclear reactor of VVER-type. Chemical composition and radiation-chemical kinetics of containment atmosphere, required recombiner capacity for various accident scenarios and, finally, gasdynamics of hydrogen oxidation process in the recombiner are of particular interest in this paper.

478 (EUR–14039, pp. 333-342) **Hydrogen behaviour in VVER - 440 nuclear power plants in case of severe accidents.** Techy, Z.; Lajtha, G. Commission of the European Communities,

Luxembourg (Luxembourg). 1992. (CONF-9103264–: Proceedings of a Workshop on Hydrogen behaviour and mitigation in water-cooled nuclear power reactors, Brussels (Belgium), 4-8 Mar 1991). In *Hydrogen behaviour and mitigation in water-cooled nuclear power reactors.* 370p. Order Number DE93721166. Source: OSTI; NTIS (US Sales Only); INIS.

We have performed calculations for three severe accident sequences of the VVER - 440 plant: small break LOCA with loss of offsite and onsite power (S2B), transient with station blackout (TMLB), and small break LOCA with ECC inoperability (S2D). The calculations have been accomplished by the Source Term Code Package (STCP), modified for VVER reactor applications. Containment integrity is jeopardized mainly by the hydrogen evolved in large amounts from the zirconium reaction during the ex-vessel core-concrete interaction. Intense pressure spikes resulting from hydrogen deflagrations for the S2B and TMLB sequences may damage the containment. Operation of containment sprays in the S2D sequence leads to a series of deflagrations with smaller intensity. Overpressurization resulting from heat generation and release of steam and gases do not threaten containment integrity for prolonged time periods.

479 (EUR–14039, pp. 343-355) **A strategy for hydrogen risks in WWER nuclear power plants.** Fineschi, F. (Pisa Univ. (Italy). Dipt. di Costruzioni Meccaniche e Nucleari). Commission of the European Communities, Luxembourg (Luxembourg). 1992. (CONF-9103264–: Proceedings of a Workshop on Hydrogen behaviour and mitigation in water-cooled nuclear power reactors, Brussels (Belgium), 4-8 Mar 1991). In *Hydrogen behaviour and mitigation in water-cooled nuclear power reactors.* 370p. Order Number DE93721166. Source: OSTI; NTIS (US Sales Only); INIS.

There are three danger levels related to the combustion of the hydrogen which is generated and released in the reactor containment during a loss of coolant accident in a water-cooled nuclear power plant. A strategy to deal with hydrogen risks should be based on three main rules related to the 'defense in depth' concept. This analysis compares the impact that different designs of containment systems have on the hydrogen problem in WWER plants built in Eastern Europe. A comparison with Western nuclear plants is made to favour international co-operation for the solution of the hydrogen problem in existing plants, wherever they may be. In WWERs, complete pre-inerting is impossible and post-inerting entails an expensive filtered venting. Recombiners have to be installed in all plants to avoid deflagrations as far as possible. In WWERs-1000 a deliberate ignition system could be installed in addition to recombiners, while in WWERs-440 deliberate ignition could even be detrimental.

480 (EUR–14363, pp. 25-36) **The BR3 pressurized water reactor pilot dismantling project. Chemical decontamination of the primary loop development and commissioning of equipment for the segmenting of the reactor internals.** Motte, F. (Centre d'Etude de l'Energie Nucleaire, Mol (Belgium)); Klein, M.; Massaut, V.; Bourdelet, M.; Saumon, P.; Lefebvre, A.; Scholl, K.; Wille, H.; Operschall, H. Commission of the European Communities, Luxembourg (Luxembourg). 1992. (CONF-9109441–: 2. Seminar on practical decommissioning experience with nuclear installations in the European Community, Sellafield (United Kingdom), 25-26 Sep 1991). In *Practical decommissioning experience with nuclear installations in the European Community.* 207p. Order Number DE93721081. Source: OSTI; NTIS (US Sales Only); INIS.

The decontamination of the primary loop has been performed in 1991 using the CORD process. Three decontamination cycles were performed. Each cycle comprises an oxidation step with permanganic acid, a reduction decontamination step with oxalic acid with the fixation of the activity on ion exchange beds and finally a cleaning step. Gamma radiation dose rate are measured before and after decontamination, using thermoluminescent detectors. For segmenting the BR3 reactor internals, especially the thermal shield, three methods have been selected and the corresponding equipment has been developed: mechanical sawing, electrodischarge machining and plasma arc cutting. Preliminary cold tests are compared for these three methods.

483 (KAERI/RR–934/91) **Development of design technology for an advanced pressurized water reactor: Improvements of the reactor coolant system.** Kim, Dong Soo (Korea Atomic Energy Research Inst., Daeduk (Korea, Republic of)); Chang, Won Pyo; Park, Koon Chul. Korea Atomic Energy Research Inst., Daeduk (Korea, Republic of). Jul 1991. 167p. (In Korean). Order Number DE93605786. Source: OSTI; NTIS (US Sales Only); INIS.

The objective of the project is to localize technology for the improvement of the reactor coolant system through a multidimensional thermal-hydraulic analysis for the steam generator and the pressurizer. Flow distribution analysis has been done for the YGN 3/4 steam generators when steady-state output conditions were varied in the ranges such as 100, 75, 50, and 25 using three-dimensional ATHOS 3 code. The results of the thermal-hydraulic analysis have been used for flow-induced vibration analysis for the YGN 3/4 steam generators. ATHOS 3 code has been modified for YGN 3/4 steam generator tube lane region using the cartesian geometry and the local porosity in the boundaries of the two adjacent cells. Stability ratio for the tube vibration has been calculated the modified ATHOS 3 and ANSYS code. A sensitivity study for the pressurizer volume change has been analyzed using LTC code which is for the performance analysis to predict an optimistic pressurizer volume. (Author).

484 (KAERI/RR–1013/91) **Development of design technology for advanced pressurized water reactor: A feasible study for the passive reactor development.** Kim, Si Hwan (Korea Atomic Energy Research Inst., Daeduk (Korea, Republic of)); Chang, Moon Hee; Lee, Jong Chul. Korea Atomic Energy Research Inst., Daeduk (Korea, Republic of). Aug 1991. 541p. (In Korean). Order Number DE93605782. Source: OSTI; NTIS (US Sales Only); INIS.

In order to investigate the feasibility of the domestic passive reactor development, the analysis and evaluation on the development status, technical characteristics, and the safety and economy for the overseas passive reactors were carried out based on the vendor's information. Also the domestic nuclear technology basis was surveyed. The analysis and evaluation of the development status and technical characteristics were performed mainly for the AP-600 developed by Westing house and the SIR of UKAEA. The new design concepts and system characteristics have been evaluated by utilizing EPRI Utility Requirement Documents and Lahmeyer evaluation criteria. Based on this evaluation the recommendable design concepts in each major system were selected. The feasibility for the domestic passive reactor development has focused on the safety, technology and economy aspects, and on the applicability

of the existing domestic technology to the design of the passive reactor. And the development plan for the domestic passive reactor was recommended in a step by step way. (Author).

485 (KAERI/RR–1023/90) **A study on severe accidents of nuclear power plants.** Park, Chang Kyu (Korea Atomic Energy Research Inst., Daeduk (Korea, Republic of)); Chae, Sung Ki; Cho, Sung Won. Korea Atomic Energy Research Inst., Daeduk (Korea, Republic of). Sep 1991. 334p. (In Korean). Order Number DE93605783. Source: OSTI; NTIS (US Sales Only); INIS.

The severe accident analysis computer codes, such as SCDAP/RELAP5, CONTAIN and MELCOR are installed on a SUN workstation. This resulted in reducing the amount of computing cost and eliminating the inconvenience due to use of large computer system. The user's guide of SCDAP/RELAP5 and CONTAIN codes were prepared for easy use of these codes. As a phenomenological study in severe accidents, hydrogen burn models adapted in the HECTR and MAAP computer codes have been examined. Also, the effect of the non-condensible gases on natural circulation was investigated using SCDAP/RELAP5. V-sequence in YGN 3 and 4 was assessed using STCP. The amount of radioactive fission product release to the environment in this sequence is rather large since it is released via auxiliary building. As a first step to develop on accident management methodology, several accident management strategies were reviewed. Especially, coolability of the degraded core was investigated. Scaling model law for DCH was developed. Standard cavity which can minimize the effect of DCH was designed. (Author).

486 (KAERI/RR–1030/91) **Experimental research on pressurized water reactor(PWR) safety.** Kim, Dong Su (Korea Atomic Energy Research Inst., Daeduk (Korea, Republic of)); Chae, Sung Ki; Chang, Won Pyo. Korea Atomic Energy Research Inst., Daeduk (Korea, Republic of). Dec 1991. 257p. (In Korean). Order Number DE93605784. Source: OSTI; NTIS (US Sales Only); INIS.

The objective of this research is to analyze the experimental results already performed in BETHSY facility of CEA France and to establish essential technologies for the future implementation of both such an experiment and computer code assessment, which are not undergoing in Korea so far. The contents of the present study are divided into 2 categories; namely, analysis of the BETHSY experimental data received from CEA, and CATHARE computer code simulation for the selected experiments, i.e. 'Natural Circulation(Test 4.3a)' and '2 Cold Leg Break'. The later studies are performed under the aims of CATHARE assessment as well as qualification of KOSAC code developing at KAERI, which is the subject in the next year and will concern an adequacy of KOSAC for the prediction of low flow natural circulation and a small break transients. (Author).

487 (KAERI/RR–1063/91) **Development of nuclear district heating reactor.** Moon, Kap Suk (Korea Atomic Energy Research Inst., Daeduk (Korea, Republic of)); Kwack, Eun Ho; Sur, Uk Hwan. Korea Atomic Energy Research Inst., Daeduk (Korea, Republic of). Jan 1991. 225p. (In Korean). Order Number DE93605785. Source: OSTI; NTIS (US Sales Only); INIS.

The growth of the heating load over the 2000s can give rise to the limitation of fossil fuels and causes increased pollution so that an ecosystem destruction will be felt more and more serious. Such characteristics indicate a need for a nuclear energy. The objectives of the project are to establish the design concepts and study the technical and economic feasibility for development and construction of a Nuclear District Heating Reactor (NDHR) with passive/inherent safety concept at KAERI site. The pool-type was determined for NDHR based on understanding the development status and NDHR concepts from various countries and estimating safety, technical and economic features for the NDHR. It is recommended that the development and construction of the NDHR should be carried out only after establishment of a suitable utilization plan for the NDHR by taking into account upcoming problems such as compatibility with the existing facility in KAERI, practical application and commercial use of the NDHR afterward. (Author).

488 (KAERI/RR–1069/91) **Study on computerization of PWR secondary side chemistry monitoring.** Yang, Kyung Rin (Korea Atomic Energy Research Inst., Daeduk (Korea, Republic of)); Hong, Kwang Bum; Lee, Eun Hee. Korea Atomic Energy Research Inst., Daeduk (Korea, Republic of). Jan 1991. 70p. (In Korean). Order Number DE93605446. Source: OSTI; NTIS (US Sales Only); INIS.

A computer program for on-line chemistry monitoring system which located in secondary side of PWR plant is under developing. 500A measurement and control system is used for data acquisition and control and scientific and engineering software package of ASYST is used for developing software program. The contents of two computer programs which developed until now are as follows; (1). Data Acquisition and Real-Time Display : The output signals of monitoring chemical sensors are stored in PC showing real-time display. When signal is over the action level, alarm is generated and data acquisition is terminated. (2). Data Management and Trending Graphs : The data stored in PC are output in various graphic mode for data management such as simple trending graphs screen display, time duration plot and histogram plot. (Author).

489 (UJV–9670-R) **A result of the WWER-1000 benchmark: The core level calculation.** Vrba, L. Ustav Jaderneho Vyzkumu CSKAE, Rez (Czechoslovakia). May 1992. 28p. Order Number DE93605787. Source: OSTI; NTIS (US Sales Only); INIS.

A calculation of the core level part of the IAEA WWER-1000 benchmark (Kalinin NPP, Unit 1, Cycles 1-6) was performed using the BIPR-6 code. In the calculation, input data proposed by the KASSETA code in Energoprojekt, Prague were used. Calculated critical boron concentrations and the power distributions, both axial and over assemblies, are tabulated for cycles 1-6. (Z.S.) 19 tabs., 7 figs., 6 refs.

490 (UJV–9685-R,D) **Investigations for WWER reactor pressure vessel neutron exposure evaluation in CSFR.** Osmera, B. Ustav Jaderneho Vyzkumu CSKAE, Rez (Czechoslovakia). Jun 1992. 34p. Order Number DE93605788. Source: OSTI; NTIS (US Sales Only); INIS.

The self-consistent results of WWER-440 reactor pressure vessel monitoring correspond to the mockup methodology. The calculations underestimate the density of neutron flux impinging on the pressure vessel inner wall in comparison with the experimental data evaluated by means of the mockup. In results adopted for reactor pressure vessel dosimetry, the effects of the displacer (effective decreasing of the water density in the mockup) and of air gaps on measurements over the pressure vessel thickness were neglected. The influence of the LR-0 tank (16 mm thick aluminium vessel) was disregarded, it was also estimated by experiment. In the mockups of WWER-1000 geometry a background of albedo neutrons was found. The effect was suppressed using a thick axial reflector. (author) 12 figs., 5 tabs., 9 refs.

491 (EUR–14363, pp. 11-23) **Pilot dismantling of the Windscale advanced gas-cooled reactor - phase 1: dismantling of the refuelling stand pipes and RPV top dome.** Taylor, E. (AEA Decommissioning and Radwaste, Windscale (GB)); Sloan, P. Commission of the European Communities, Luxembourg (Luxembourg). 1992. (CONF-9109441–: 2. Seminar on practical decommissioning experience with nuclear installations in the European Community, Sellafield (United Kingdom), 25-26 Sep 1991). In *Practical decommissioning experience with nuclear installations in the European Community.* 207p. Order Number DE93721081. Source: OSTI; NTIS (US Sales Only); INIS.

Large scale dismantling began in 1989 by dismantling the reactor refuelling machine weighing some 470 tons. Parts of this machine were utilised as a heavy lifting frame for the removal of the reactor top biological shield, a 60 tons steel and concrete structure. The top biological shield was subsequently size reduced using thermic lancing in a temporary containment constructed on the reactor refuelling floor. Since 1990 the two major operations have been to remove the reactor pressure vessel top dome and cut the refuelling stand pipes thus exposed inside the RPV, down

to the level of the reactor hot box. Operation is described and dose uptake estimated.

492 (EUR–14363, pp. 81-93) **Remote dismantling experience at Windscale pile chimneys and other AEA/BNFL facilities.** Wright, E.M. (British Nuclear Fuels plc, Sellafield (United Kingdom)); Jones, E.L.; Leng, J.H. Commission of the European Communities, Luxembourg (Luxembourg). 1992. (CONF-9109441–: 2. Seminar on practical decommissioning experience with nuclear installations in the European Community, Sellafield (United Kingdom), 25-26 Sep 1991). In *Practical decommissioning experience with nuclear installations in the European Community*. 207p. Order Number DE93721081. Source: OSTI; NTIS (US Sales Only); INIS.

This paper described recent remote dismantling experience at British Nuclear Fuels Ltd and at AEA Technology. Three areas are considered, firstly transfer of proven technology from non-nuclear industries, aimed at ensuring low commercial risk where tasks are relatively simple and radiation levels permit some human intervention. Work on dismantling the Windscale Pile Chimneys falls into this category. Secondly the equipment developed to support the decommissioning of the Windscale Advanced Gas Cooled Reactor is discussed. Finally a summary is given of the systems developed to cut, divert and weld a highly active raffinate line and to recover fuel rods within the Sellafield Magnox Reprocessing Plant.

493 (Juel–2585) **Studies on transferring the safety features of the module reactor to a large power reactor.** Sun Yuliang. Forschungszentrum Juelich GmbH (Germany). Inst. fuer Sicherheitsforschung und Reaktortechnik; Technische Hochschule Aachen (Germany). Feb 1992. 112p. (In German). Order Number DE93720185. Source: OSTI; NTIS (US Sales Only); INIS.

The German industries and research institutions have developed the HTR module reactor, which is strongly characterized by inherent safety features. The power output is limited to about 200 MWth because of its core configuration. It has been investigated in this work, whether the safety features of the module reactor can be transferred to larger power reactors. For this purpose the conceptual design of a ring core pebble bed reactor has been made with a thermal power output of 3000 MW. By means of computer calculations, the principal physical, thermohydraulical and safety features of the ring reactor have been studied. It has been shown that the 3000-MWth ring reactor basically possesses the same safety characteristics as the small module reactor. At reactivity disturbances, the reactor is shut down passively by the strongly negative temperature coefficient. The decay heat removal is also realized based on the passive priniciple. In the case of a total loss of coolant, the maximum fuel element temperature remains below 1600deg C; and consequently the retention of fission products in the fuel elements is fully attained. The control of xenon oscillations takes place inherently due to the mutual coupling between the local power production and the fuel temperature. (orig.).

494 (AECL–10000) **Steam generator tube performance: Experience with water-cooled nuclear power reactors during 1986.** Tatone, O.S. (Atomic Energy of Canada Ltd., Chalk River, ON (Canada). Chalk River Nuclear Labs.); Tapping, R.L.; Stipan, L. Atomic Energy of Canada Ltd., Chalk River, ON (Canada). Chalk River Nuclear Labs. Mar 1992. 87p. Order Number DE93603875. Source: OSTI; NTIS (US Sales Only); INIS.

A survey of steam generator operating experience for 1986 has been carried out for 184 pressurized water and pressurized heavy-water reactors, and 1 water-cooled, graphite-moderated reactor. Tubes were plugged at 75 of the reactors (40.5%). In 1986, 3737 tubes were plugged (0.14% of those in service) and 3148 tubes were repaired by sleeving. A small number of reactors accounted for the bulk of the plugged tubes, a phenomenon consistent with previous years. For 1986, the available tubesheet sludge data for 38 reactors has been compiled into tabular form, and sludge/deposit data will be incorporated into all future surveys.

495 (AECL–10388) **Ontario Hydro experience with extended-burnup power reactor fuel.** Novak, J. (Ontario Hydro, Toronto, ON (Canada)); Hastings, I.J. Atomic Energy of Canada Ltd., Chalk River, ON (Canada). Chalk River Nuclear Labs. Jul 1991. 17p. (CONF-910454–: International ANS/ENS topical meeting on LWR fuel performance: fuel for the 90s, Avignon (France), 21-24 Apr 1991). Order Number DE93603876. Source: OSTI; NTIS (US Sales Only); INIS.

UO_2 fuel has been irradiated in Ontario Hydro commercial reactors to a maximum burnup of 770 MW.h/kg U (30 000 MW.d/TeU) at a maximum linear power of 58 kW/m. There appears to be a burnup threshold at about 450 MW.h/kg U (20 000 MW.d/TeU), above which enhanced fission-gas release (up to 28%), grain growth and diametral strain (up to 2%) may be observed, with defects due to stress-corrosion cracking. The inference is that the extended-burnup effects are associated with a degradation in fuel conductivity and/or fuel-to-sheath heat transfer, resulting in acceleration of thermally activated processes. An interim burnup guideline of 450 MW.h/kg U (bundle average) has been defined for Ontario Hydro station operation. (11 refs., 5 figs.).

496 (AECL–10426) **An elasto-plastic model for mechanical contact between the pellets and sheath in CANDU nuclear fuel elements.** Arimescu, V.I. Atomic Energy of Canada Ltd., Chalk River, ON (Canada). Chalk River Nuclear Labs. Jun 1991. 15p. (CONF-9106378–: 12. annual conference of the Canadian Nuclear Society, Saskatoon (Canada), 9-12 Jun 1991). Order Number DE93603877. Source: OSTI; NTIS (US Sales Only); INIS.

During high-temperature transients, increased mechanical contact can occur between the fuel stack and the sheath in the axial and/or radial direction. As well, there is an axial linear power gradient and an axial gradient in mechanical properties of the sheath specific to a CANDU-type fuel element. This requires a code with the capability to treat multiple axial segments. This paper describes a contact model that allows the elasto-plastic mechanical contact in radial/axial direction for multiple axial segments. (14 figs., 5 refs.).

497 (AECL–10622) **Modeling CANDU type fuel behaviour during extended burnup irradiations using a revised version of the ELESIM code.** Arimescu, V.I.; Richmond, W.R. Atomic Energy of Canada Ltd., Chalk River, ON (Canada). Chalk River Nuclear Labs.; Ontario Hydro, Toronto, ON (Canada). May 1992. 27p. (COG–92-141.). Order Number DE93603878. Source: OSTI; NTIS (US Sales Only); INIS.

The high-burnup database for CANDU fuel, with a variety of cases, offers a good opportunity to check models of fuel behaviour, and to identify areas for improvement. Good agreement of calculated values of fission-gas release, and sheath hoop strain, with experimental data indicates that the global behaviour of the fuel element is adequately simulated by a computer code. Using, the ELESIM computer code, the fission-gas release, swelling, and fuel pellet expansion models were analysed, and changes made for gaseous swelling, and diffusional release of fission-gas atoms to the grain boundaries. Using this revised version of ELESIM, satisfactory agreement between measured values of fission-gas release was found for most of the high-burnup database cases. It is concluded that the revised version of the ELESIM code is able to simulate with reasonable accuracy high-burnup as well as low-burnup CANDU fuel.

498 (AECL–10636) **Fission-gas release in fuel performing to extended burnups in Ontario Hydro nuclear generating stations.** Floyd, M.R.; Novak, J.; Truant, P.T. Atomic Energy of Canada Ltd., Chalk River, ON (Canada). Chalk River Nuclear Labs. Jun 1992. 22p. Order Number DE93603879. Source: OSTI; NTIS (US Sales Only); INIS.

The average discharge burnup of CANDU fuel is about 200 MWh/kgU. A significant number of 37-element bundles have achieved burnups in excess of 400 MWh/kgU. Some of these bundles have experienced failures related to their extended operation. To date, hot-cell examinations have been performed on fuel elements from nine 37-element bundles irradiated in Bruce NGS-A that have burnups in the range of 300-800 MWh/kgU.[1] Most of these have declining power histories from peak powers of up to 59 kW/m. Fission-gas releases of up to 26% have been observed and

exhibit a strong dependence on fuel power. This obscures any dependence on burnup. The extent of fission-gas release at extended burnups was not predicted by low-burnup code extrapolations. This is attributed primarily to a reduction in fuel thermal conductivity which results in elevated operating temperatures. Reduced conductivity is due, at least in part, to the buildup of fission products in the fuel matrix. Some evidence of hyperstoichiometry exists, although this needs to be further investigated along with any possible relation to CANLUB graphite coating behaviour and sheath oxidation. Residual tensile sheath strains of up to 2% have been observed and can be correlated with fuel power/fission-gas release. SCC[2]-related defects have been observed in the sheath and endcaps of elements from bundles experiencing declining power histories to burnups in excess of 500 MWh/kgU. This indicates that the current recommended burnup limit of 450 MWh/kgU is justified. SCC-related defects have also been observed in ramped bundles having burnups < 450 MWh/kgU. Hence, additional guidelines are in place for power ramping extended-burnup fuel.

499 (AECL–10655) **Extended-burnup CANDU fuel: Description of database and comparisons with code predictions.** Richmond, W.R.; Bunge, J.M.; Arimescu, V.I. Atomic Energy of Canada Ltd., Chalk River, ON (Canada). Chalk River Nuclear Labs.; Ontario Hydro, Toronto, ON (Canada). Jun 1992. 20p. (COG–92-177.). Order Number DE93603880. Source: OSTI; NTIS (US Sales Only); INIS.

Interest in the modelling of extended-burnup CANDU fuel has been prompted by the examinations of such fuel from CANDU reactors and the development of extended-burnup CANDU fuel for the future. A study was done at AECL Research to compile a database on experimental irradiations whose outer-element burnups exceed 300 MW.h/kgU. This paper describes the elements that comprise the database and discusses analysis of fission-gas-release measurements against experimental parameters. Fission-gas-release measurements are also compared against predicted results from the MOD10 and MOD11 versions of the code ELESIM.

500 (BARC–1991/E/020) **Stress-induced reorientation of hydride precipitates in Zr-2.5Nb-0.5Cu garter springs under complex loading.** De, P.K. (Bhabha Atomic Research Centre, Bombay (India). Metallurgy Div.); John, J.T.; Raman, V.V.; Banerjee, S. Bhabha Atomic Research Centre, Bombay (India). 1991. 37p. Order Number DE93605811. Source: OSTI; NTIS (US Sales Only); INIS.

Zr-2.5Nb-0.5Cu garter springs which are placed between coolant and calandria tubes in PHWRs experience complex loading due to simultaneous application of tension, compression and torus bending moment due to coolant tubes. The gradual pick up of hydrogen by the garter springs during service is likely to have hydride platelets reoriented under the applied stresses. In the present paper, the magnitudes and the directions of the principal stresses under the complex loading condition obtained have been calculated and the extent of hydride reorientation predicted. Simulation experiments consisting of simulated loading of hydrogen (upto 400 ppm) precharged springs at the service temperature (300degC) and also in-situ hydrogen charging of the springs under simulated loading conditions have been carried out. In addition, hydrogen precharged springs have been subjected to temperature cycling between 50 and 300degC under complex loading conditions, to evaluate the influence of temperature variation on hydride reorientation. Metallographic examination of the hydride platelets in the above springs has shown an excellent agreement with the analytical prediction. Torus bending moment values appear to play a significant role in reorienting the hydride platelets. It has been observed that under normal torus bending moment corresponding to 90 mm dia coolant tubes hydrogen platelets close to the outer rim of the spiral get reoriented in the radial direction. However, on application a torus bending moment corresponding to 30 mm dia tubes, hydride platelets get reoriented along the radial direction, irrespective of the magnitude of tensile and compression loading. (author). 9 refs., 15 figs., 1 appendix.

501 (DOE/ER/13045–T1) **Hydrodynamically induced dryout and post dryout important to heavy water reactors: A yearly progress report.** Ishii, M.; Revankar, S.T.; Babelli, I.; Lele, S. Purdue Univ., Lafayette, IN (United States). Thermalhydraulics and Reactor Safety Lab. Jun 1992. 56p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-90ER13045. (PU-NE–92/2). Order Number DE93000403. Source: OSTI; NTIS; INIS; GPO Dep.

Recently, the safety of low pressure liquid cooled nuclear reactors has become a very important issue with reference to the operation of the heavy water reactors at Savannah River Plant. Under accident conditions such as loss-of-flow or loss-of-coolant, these reactors typically encounter unstable two-phase flow which may lead to the occurrence of dryout and subsequent fuel failure. An analytical study using the one-dimensional drift flux model was carried out to investigate the two-phase flow instability for Westinghouse Savannah River Site reactor. The analysis indicates that the first and higher order instabilities exist in the possible transient operational conditions. The instabilities are encountered at higher heat fluxes or lower flow rates. The subcooling has a stabilizing effect except at very low subcooling. An experimental loop has been designed and constructed to study the CBF induced by various flow instabilities. Details of this test loop are presented. Initial test results have been presented. The two-phase flow regimes and hydrodynamic behaviors in the post dryout region have been studied under propagating rewetting conditions. The effect of subcooling and inlet velocity on flow transition as well as on the quench front propagation was investigated. The test liquid was Freon 113 which was introduced into the bottom of the quartz test section whose walls were maintained well above the film boiling temperature of the test liquid, via a transparent heat transfer fluid. The flow regimes observed down stream of the upward moving quench front were the rough wavy, the agitated, and the dispersed droplet/ligaments. A correlation for the flow regime transition between the inverted annular and the dispersed droplet/ligament flow patterns was developed. The correlation showed a marked dependence on the void fraction at the CBF location and hence on the flow regime encountered in the pre-CBF region.

502 (DPW–871) **Reactor atmosphere.** Cherney, B.J. Du Pont de Nemours (E.I.) and Co., Aiken, SC (United States). 3 Apr 1951. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035 ;AC09-76SR00001. Order Number DE92040836. Source: OSTI; NTIS (US Sales Only); GPO Dep.

This memorandum presents a conceptual design for a blanket gas system for a heavy water pile whose primary purpose is to collect gas resulting from moderator decomposition and to convert the deuterium portion of this gas to heavy water. Another function of the system is to remove holdup light or heavy water prior to operation or maintenance.

503 (EUR–14039, pp. 184-195) **Calculation of the pressure transient due to hydrogen deflagration in closed and vented volumes.** Klazek, P.S. (Ontario Hydro, Toronto, ON (Canada)). Commission of the European Communities, Luxembourg (Luxembourg). 1992. (CONF-9103264–: Proceedings of a Workshop on Hydrogen behaviour and mitigation in water-cooled nuclear power reactors, Brussels (Belgium), 4-8 Mar 1991). In *Hydrogen behaviour and mitigation in water-cooled nuclear power reactors.* 370p. Order Number DE93721166. Source: OSTI; NTIS (US Sales Only); INIS.

Reactor licensing assessments for multi-unit CANDU containments involve the calculation of the pressure transients due to postulated hydrogen deflagration. The calculation is based on an one dimensional consideration of the global mass and energy balance and relies on an empirical burn rate constant to adjust the mixture burning rate for momentum transfer effects. The work presented here shows the values of the empirical burn rate constant recommended for similar kinds of calculations involving vented hydrocarbon-air deflagrations are applicable to calculations for hydrogen-air deflagrations.

504 (EUR–14039, pp. 215-223) **A simplified analysis of the effect of hydrogen generation following a beyond design basis accident in an Indian PHWR.** Venkat Raj, V. (Bhabha Atomic Research Centre, Bombay (India)); Markandeya, S.G.; Ganju, S.; Ghosh, A.K.; Kakodkar, A. Commission of the European Communities, Luxembourg (Luxembourg). 1992. (CONF-9103264–: Proceedings of a Workshop on Hydrogen behaviour and mitigation in water-cooled nuclear power reactors, Brussels (Belgium), 4-8

Mar 1991). In *Hydrogen behaviour and mitigation in water-cooled nuclear power reactors.* 370p. Order Number DE93721166. Source: OSTI; NTIS (US Sales Only); INIS.

This paper presents the analysis carried out for the assessment of the effect of hydrogen generation following a Beyond Design Basis Accident in a standardised 235 MWe Indian Pressurised Heavy Water Reactor. The accident considered involves LOCA followed by the failure of the Emergency Core Cooling System and delay in reactor shut down. The break size considered for LOCA is 20% as this is likely to result in maximum core heat up. The effect of metal-water reaction, hydrogen generation and possible deflagration have been assessed.

505 (EUR–14363, pp. 49-79) **Report on the first steps of the remote-controlled dismantling of the pressure-tube HWGCR of KKN at Niederaichbach.** Ruedinger, V. (Kernforschungszentrum Karlsruhe GmbH (Germany)); Engelhardt, G.; Herzog, G.; Obst, H.J. Commission of the European Communities, Luxembourg (Luxembourg). 1992. (CONF-9109441–: 2. Seminar on practical decommissioning experience with nuclear installations in the European Community, Sellafield (United Kingdom), 25-26 Sep 1991). In *Practical decommissioning experience with nuclear installations in the European Community.* 207p. Order Number DE93721081. Source: OSTI; NTIS (US Sales Only); INIS.

Dismantling operations at the prototype NPP Niederaichbach (KKN) started in 1988. After removal of all inactive as well as the contaminated components the remote-controlled dismountment of the activated pressure tube reactor could be started in November 1990. These operations are performed inside an additional containment in the reactor building with the aid of especially designed equipment. So far 50% of this phase of decommissioning was performed successfully. Due to the precautions taken the radiation exposure of personnel as well as emissions to the environment could be kept at very low levels.

506 (INFO–0234-1) **Follow-up to the accident at Chernobyl and its implications for the safety of CANDU reactors.** Atomic Energy Control Board, Ottawa, ON (Canada). May 1990. 45p. (In English, French). Order Number DE93603881. Source: OSTI; NTIS (US Sales Only); INIS.

This report updates the status of the nine recommendations arising from the AECB staff review of the Chernobyl accident (INFO–0234). Six of the nine recommendations have been satisfactorily responded to by the Canadian nuclear utilities and are considered to be closed. Any follow-up actions arising from the responses to the recommendations will be addressed as part of the continuing licensing process. Of the remaining three, one concerns the effectiveness of the reactor shutdown systems under unusual circumstances. Satisfactory progress is being made. The other two outstanding items concern reviews of emergency and fire fighting practices. Again, satisfactory progress is being made but the response to the recommendations is not yet complete. Each recommendation is discussed separately in the body of this report.

507 (INFO–0317) **The commissioning of nuclear power plants.** Atomic Energy Control Board, Ottawa, ON (Canada). Advisory Committee on Nuclear Safety. Sep 1989. 27p. (In English, French). (ACNS–13;CCSN–13.). Order Number DE93603882. Source: OSTI; NTIS (US Sales Only); INIS.

The objectives and requirements to be met in commissioning nuclear power plants are presented. The objective of commissioning is to ensure that each component, subsystem, system, or structure in a plant will be capable of fulfilling its design requirements throughout its design life. The requirements for commissioning are: the preparation of a detailed, comprehensive, documented program to demonstrate that all components, systems and structures relevant to safety meet design intent; documented evidence that safety systems are fully operable and can meet design requirements; and, appropriate documentation of the actual state or behaviour of all components, systems and structures relevant to safety. All systems must be included in the commissioning program. Whenever possible, full safety system test should be performed. If a full system in situ test is not possible, alternative means are suggested. (8 refs.).

508 (INFO–0319) **Canadian programs on understanding and managing aging degradation of nuclear power plant components.** Chadha, J.A. (Ontario Hydro, Toronto, ON (Canada)); Pachner, J. Atomic Energy Control Board, Ottawa, ON (Canada). Jun 1989. 14p. (CONF-890696–: 10. annual conference of the Canadian Nuclear Association: nuclear fission–halfway to the first century, Ottawa (Canada), 4-7 Jun 1989). Order Number DE93603883. Source: OSTI; NTIS (US Sales Only); INIS.

Maintaining adequate safety and reliability of nuclear power plants and nuclear power plant life assurance and life extension are growing in importance as nuclear plants get older. Age-related degradation of plant components is complex and not fully understood. This paper provides an overview of the Canadian approach and the main activities and their results towards understanding and managing age-related degradation of nuclear power plant components, structures and systems. A number of pro-active programs have been initiated to anticipate, detect and mitigate potential aging degradation at an early stage before any serious impact on plant safety and reliability. These programs include Operational Safety Management Program, Nuclear Plant Life Assurance Program, systematic plant condition assessment, refurbishment and upgrading, post-service examination and testing, equipment qualification, research and development, and participation in the IAEA programs on safety aspects of nuclear power plant aging and life extension. A regulatory policy on nuclear power plants is under development and will be based on the domestic as well as foreign and international studies and experience.

509 (INFO–0365) **AECB staff annual report on Point Lepreau G.S. for the year 1989.** Atomic Energy Control Board, Ottawa, ON (Canada). May 1990. 17p. Order Number DE93603884. Source: OSTI; NTIS (US Sales Only); INIS.

This report is a review by Atomic Energy Control Board (AECB) staff of the operation of Point Lepreau Nuclear Generating Station during 1989. The review is based on information contained in the various documents submitted by New Brunswick Power under the terms of the Operating Licence and on information gathered by AECB staff during routine site monitoring, inspections and audits. AECB staff considers that the station has been operated and managed safely during 1989. The lifetime availability performance of the four special safety systems is poor, and the initiatives NB Power is proposing to improve this performance will need to be pursued aggressively to ensure that these systems meet their availability requirements in the future. Slow response to AECB action items and excessive delays in the production of full reports for events reportable under the operating licence indicate a need for NB Power to examine the organization and resourcing of some of its safety and compliance functions. (tab.).

510 (INFO–0367) **AECB staff review of Bruce NGS 'A' operation for the year 1989.** Atomic Energy Control Board, Ottawa, ON (Canada). Jun 1990. 31p. Order Number DE93603885. Source: OSTI; NTIS (US Sales Only); INIS.

The operation of the Bruce Nuclear Generating Station 'B' is monitored and licensing requirements are enforced by the Atomic Energy Control Board (AECB). This report records the conclusions of the AECB staff assessment of Bruce NGS 'A' during 1989 and the early part of 1990. Overall operation of the station met acceptable safety standards. Despite numerous problems and technical difficulties encountered, station management and supervisory personnel acted with due caution and made decisions in the interests of safety. There was evidence of improvement in a number of key areas, supported by pertinent indicators in the objective measures table. The extensive inspection and maintenance programs carried out during the year revealed the extent of component deterioration due to aging to be larger than expected. Hydrogen embrittlement of pressure tubes, erosion/corrosion of steam and feed water valves, heat exchanger tubes and piping, fouling of boilers and heat exchangers, and environmental damage of electrical equipment are examples. Continued aging of plant equipment and its potential for reducing the margins for safe operation must be taken into account by Ontario Hydro in establishing priorities and target dates for completion of actions to resolve identified problems at Bruce NGS 'A'. (2 tabs.).

511 (INFO–0368) **AECB staff review of Bruce NGS 'B' operation for the year 1989.** Atomic Energy Control Board, Ottawa, ON (Canada). Jun 1990. 22p. Order Number DE93603886. Source: OSTI; NTIS (US Sales Only); INIS.

The operation of the Bruce Nuclear Generating Station 'B' is monitored and licensing requirements are enforced by the Atomic Energy Control Board (AECB), which observes operation of the reactors, conducts audits, witnesses important activities, reviews station documentation and reports, and issue approvals, where appropriate, in accordance with licence conditions. This report records the conclusions of the AECB staff assessment of Bruce NGS 'B' during 1989. In general, the station operated within acceptable safety standards. Quality improvement initiatives started in 1989 should lead to improved station maintenance and operation in coming years. Ontario Hydro still needs to improve the administration of operating memos, deficiency reports and call-ups. Station management must ensure that shift supervisors and reactor first operators operate the station in a conservative manner at all times and put safety interests first when responding to a unit upset. (2 tabs.).

512 (INFO–0370) **Fuel channel refilling: Data analysis.** Shoukri, M. (BSC Thermal Science Inc., Oakville, ON (Canada)); Abdul-Razzak, A. Atomic Energy Control Board, Ottawa, ON (Canada). Apr 1990. 131p. Project 2.177.1. Order Number DE93603887. Source: OSTI; NTIS (US Sales Only); INIS.

Analysis of existing data on fuel channel refilling is presented. The analysis focuses on the data obtained using the Stern Laboratories Cold Water Injection Test (CWIT) Facility. The two-fluid model thermal-hydraulics computer code CATHENA is also used to simulate experimental results on fuel channel refilling from both the CWIT and RD-14 facilities. Conclusions related to single and double break tests, including the effect of non-condensible gases, are presented. A set of recommendations is given for further analysis and separate effect experiments. (67 figs., 5 tabs., 24 refs.).

513 (INFO–0404) **Recommendations relating to safety-critical real-time software in nuclear power plants.** Atomic Energy Control Board, Ottawa, ON (Canada). Advisory Committee on Nuclear Safety. Jan 1992. 22p. (In English, French). (ACNS–19;CCSN–19.). Order Number DE93603888. Source: OSTI; NTIS (US Sales Only); INIS.

The Advisory Committee on Nuclear Safety (ACNS) has reviewed safety issues associated with the software for the digital computers in the safety shutdown systems for the Darlington NGS. From this review the ACNS has developed four recommendations for safety-critical real-time software in nuclear power plants. These recommendations cover: the completion of the present efforts to develop an overall standard and sub-tier standards for safety-critical real-time software; the preparation of schedules and lists of responsibilities for this development; the concentration of AECB efforts on ensuring the scrutability of safety-critical real-time software; and, the collection of data on reliability and causes of failure (error) of safety-critical real-time software systems and on the probability and causes of common-mode failures (errors). (9 refs.).

514 (KAERI/RR–1002/90) **Development of nuclear fuel. Development of CANDU advanced fuel bundle.** Suk, Ho Chun (Korea Atomic Energy Research Inst., Daeduk (Korea, Republic of)); Hwang, Woan; Jeong, Young Hwan; Jung, Sung Hoon. Korea Atomic Energy Research Inst., Daeduk (Korea, Republic of). Jul 1991. 399p. (In Korean). Order Number DE93605812. Source: OSTI; NTIS (US Sales Only); INIS.

In order to develop CANDU advanced fuel, the agreement of the joint research between KAERI and AECL was made on February 19, 1991. AECL conceptual design of CANFLEX bundle for Bruce reactors was analyzed and then the reference design and design drawing of the advanced fuel bundle with natural uranium fuel for CANDU-6 reactor were completed. The CANFLEX fuel cladding was preliminarily investigated. The fabricability of the advanced fuel bundle was investigated. The design and purchase of the machinery tools for the bundle fabrication for hydraulic scoping tests were performed. As a result of CANFLEX tube examination, the tubes were found to be meet the criteria proposed in the technical specification. The dummy bundles for hydraulic scoping tests have been fabricated by using the process and tools, where the process parameters and tools have been newly established. (Author).

515 (KAERI/RR–1028/91) **Development of CANFLEX fuel bundle.** Suk, Ho Chun (Korea Atomic Energy Research Inst., Daeduk (Korea, Republic of)); Hwang, Woan; Jeong, Young Hwan. Korea Atomic Energy Research Inst., Daeduk (Korea, Republic of). Dec 1991. 516p. (In Korean). Order Number DE93605813. Source: OSTI; NTIS (US Sales Only); INIS.

This research project is underway in cooperation with AECL to develop the CANDU advanced fuel bundle(so-called CANFLEX) which can enhance reactor safety and fuel economy in comparison with the current CANDU fuel and which can be used with natural uranium, slightly enriched uranium and other advanced fuel cycle. As the final schedule, the advanced fuel will be verified by carrying out a large scale demonstration of the bundle irradiation in a commercial CANDU reactors for 1996 and 1997, and consequently will be used in the existing and future reactors in Korea. The research activities during this year include the basic design of CANFLEX fuel with slightly enriched uranium(CANFLEX-SEU), with emphasis on the extension of fuel operation limit. Based on this basic design, CANFLEX fuel was mocked up. Out-of-pile hydraulic scoping tests were conducted with the fuel. (Author).

516 (ANL/CP–72040) **Irradiation experience with HT9-clad metallic fuel.** Pahl, R.G.; Lahm, C.E.; Tsai, H.; Billone, M.C. Argonne National Lab., IL (United States). [1991]. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-911001–26: International conference on fast reactor systems and fuel cycles, Kyoto (Japan), 27 Oct - 1 nov 1991). Order Number DE92041093. Source: OSTI; NTIS; INIS; GPO Dep.

the safe and reliable performance of metallic fuel is currently under study and demonstration in the Integral Fast Reactor program. In-reactor tests of HT9-clad metallic fuel have now reached maturity and have all shown good performance characteristics to burnups exceeding 17.5 at. % in the lead assembly. Because this low-swelling tempered martensitic alloy is the cladding of choice for high fluence applications, the experimental observations and performance modelling efforts reported in this paper play an important role in demonstrating reliability.

517 (ANL/CP–76685) **Physics considerations in the design of liquid metal reactors for transuranium element consumption.** Khalil, H.; Hill, R.; Fujita, E.; Wade, D. Argonne National Lab., IL (United States). [1992]. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-9209224–1: Specialists' meeting on use of fast breeder reactors for actinide transmutation, Obninsk (Russian Federation), 22-24 Sep 1992). Order Number DE92041131. Source: OSTI; NTIS; INIS; GPO Dep.

The management of transuranic nuclides in liquid metal reactors (LMR's) is considered based on the use of the Integral Fast Reactor (IFR) concept. Unique features of the IFR fuel cycle with respect to transuranic management are identified. These features are exploited together with the hard spectrum of LMR's to demonstrate the neutronic feasibility of a wide range of transuranic management options ranging from efficient breeding to pure consumption. Core physics aspects of the development of a low sodium void worth transuranic burner concept are described. Neutronics performance parameters and reactivity feedback characteristics estimated for this core concept are presented.

518 (ANTO–00075) **ALMR market assessment: The US Advanced Liquid Metal Reactor Program.** MacGregor, P.R.; Yates, R.L. General Electric Co., San Jose, CA (United States). Sep 1992. 81p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-89SF17445. Order Number DE93000353. Source: OSTI; NTIS; INIS; GPO Dep.

This report examines the potential market size for electrical generating capacity requirements from the year 2010 through the year 2030 in the United States. In particular, the report explores the ability of the Advanced Liquid Metal Reactor (ALMR) to be a viable generating capacity option in terms of competing economics during

that period. In this study, the impact of cost sensitivities, including ALMR capital costs and fossil fuel prices, on the economic potential of the ALMR are analyzed as well.

519 (EUR–14023) **Sodium fire aerosol behaviour: a review of studies carried out under the auspices of the CEC.** Dunbar, I.H. (UKAEA Risley Nuclear Power Development Establishment, Culcheth (United Kingdom). Safety and Reliability Directorate). Commission of the European Communities, Luxembourg (Luxembourg). 1992. 39p. Contract ETNU-0006-UK(A). Source: OSTI; NTIS (US Sales Only); INIS.

The purpose of the present report was to produce a synthesis of the results of four studies (Reports EUR 9172 EN, EUR 9203 EN, SESRU No. EF.21.12.R/88.527 and EUR 13274 EN) bringing out their overall contribution to our understanding of the way sodium fire aerosols behave in secondary containment buildings. In particular the following questions are addressed in the light of the information produced by the CONT group studies: (i) Are current instrumentation techniques capable of obtaining the data about aerosols needed to validate the computer models. (ii) Is the current database produced by sodium fire experiments sufficient to validate the computer models. (iii) Can the current computer codes predict the behaviour of sodium fire aerosols in hypothetical LMFBR accidents with sufficient accuracy.

520 (FRCEA-TH–366) **Damage of the Phenix fuel element clads. Realization and analysis of ultimate loading experiences. Validation and optimization of the RAMSESII methodology.** Schmidt, N. Conservatoire National des Arts et Metiers (CNAM), 75 - Paris (France); CEA Centre d'Etudes de Cadarache, 13 - Saint-Paul-lez-Durance (France). Dept. d'Etudes des Combustibles. May 1992. 174p. (In French). Order Number DE93721225. Source: OSTI; NTIS (US Sales Only); INIS.

The work executed in this memory has for objective the evaluation, from test results, of the real margins coming from the RAMSESII methodology (RAMSES: Mechanical Analysis Regulations for Structures).

521 (IGC–127) **Activity report of Reactor Physics Division - 1991.** Indira, R. (ed.). Indira Gandhi Centre for Atomic Research, Kalpakkam (India). 1992. 124p. Order Number DE93605824. Source: OSTI; NTIS (US Sales Only); INIS.

The reseach and development (R and D) activities of the Reactor Physics Division of Indira Gandhi Centre for Atomic Research (IGCAR), Kalpakkam during 1991 are reported. The activites are arranged under the headings : Nuclear Data Proceeding and Validation, Core Physics and Operation studies, Reactor Kinetics and Safety analysis, Reactor Noise Analysis and Radiation Transport and Shielding studies. List of publications is given at the end. (author). figs., tabs., r efs.

2106 Power Reactors, Mobile, Propulsion, Package, and Transportable

535 (CONF-9208154–1) **System model development for nuclear thermal propulsion.** Hannan, N.A. (Argonne National Lab., IL (United States)); Worley, B.A.; Walton, J.T.; Perkins, K.R.; Buksa, J.J.; Dobranich, D. Oak Ridge National Lab., TN (United States). [1992]. 11p. Sponsored by USDOE, Washington, DC (United States); Department of Defense, Washington, DC (United States); National Aeronautics and Space Administration, Washington, DC (United States). DOE Contract AC05-84OR21400. From 43. Congress of the International Astronautical Federation; Washington, DC (United States); 28 Aug - 5 sep 1992. Order Number DE92041262. Source: OSTI; NTIS; GPO Dep.

A critical enabling technology in the evolutionary development of nuclear thermal propulsion (NTP) is the ability to predict the system performance under a variety of operating conditions. This is crucial for mission analysis and for control subsystem testing as well as for the modeling of various failure modes. Performance must be accurately predicted during steady-state and transient operation, including startup, shutdown and post operation cooling. The development and application of verified and validated system models has the potential to reduce the design, testing, cost and time required for the technology to reach flight-ready status. Since October 1991, the US Department of Energy (DOE), Department of Defense (DOD) and NASA have initiated critical technology development efforts for NTP systems to be used on Space Exploration Initiative (SEI) missions to the Moon and Mars. This paper presents the strategy and progress of an interagency NASA/DOE/DOD team for NTP system modeling.

536 (NUTEK-NYEL–92-2) **Thermionic energy converters.** Holmlid, L. (Chalmers Tekniska Hoegskola, Goeteborg (Sweden)); Svensson, R. Swedish National Board for Industrial and Technical Development (NUTEK), Stockholm (Sweden). May 1991. 8p. (In Swedish). Project NUTEK-411-233. Order Number DE93603792. Source: OSTI; NTIS; INIS.

Research and development work on thermionic energy converters (TEC) in the Russian Federation and USA is at present mainly adressed towards TEC equipped nuclear power reactors for use in space. During the last year a large scale cooperation has started, around a Topas-II reactor which has been purchased by USA for tests. A direct cooperation also exists between companies in the Netherlands and the Russian Federation aimed towards more efficient converters. We have during the last year continued our work on the use of excited states in converters, and we have performed experimental studies of the operation of the converter and of the composition and properties of the plasma. We reach very low work functions on the collector in the presence of excited states. This gives very good results concerning the so called barrier index (figure of merit for converters). The process of application for a patent for this new type of collector with low work function has been initiated. (au).

537 (PNL-SA–20523) **Advanced hybrid nuclear propulsion Mars mission performance enhancement.** Dagle, J.E.; Noffsinger, K.E.; Segna, D.R. Pacific Northwest Lab., Richland, WA (United States). Feb 1992. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (CONF-9208114–4: American Nuclear Society meeting, Jackson Hole, WY

(United States), 16-19 Aug 1992). Order Number DE93001309. Source: OSTI; NTIS; GPO Dep.

Nuclear electric propulsion (NEP), compared with chemical and nuclear thermal propulsion (NTP), can effectively deliver the same mass to Mars using much less propellant, consequently requiring less mass delivered to Earth orbit. The lower thrust of NEP requires a spiral trajectory near planetary bodies, which significantly increases the travel time. Although the total travel time is long, the portion of the flight time spent during interplanetary transfer is shorter, because the vehicle is thrusting for much longer periods of time. This has led to the supposition that NEP, although very attractive for cargo missions, is not suitable for piloted missions to Mars. However, with the application of a hybrid approach to propulsion, the benefits of NEP can be utilized while drastically reducing the overall travel time required. Development of a dual-mode system, which utilizes high-thrust NTP to propel the spacecraft from the planetary gravitational influence and low-thrust NEP to accelerate in interplanetary space, eliminates the spiral trajectory and results in a much faster transit time than could be obtained by either NEP or NTP alone. This results in a mission profile with a lower initial mass in low Earth orbit. In addition, the propulsion system would have the capability to provide electrical power for mission applications.

538 (SAND–92-1820C) **System model development for nuclear thermal propulsion.** Walton, J.T. (National Aeronautics and Space Administration, Cleveland, OH (United States). Lewis Research Center); Hannan, N.A.; Perkins, K.R.; Buksa, J.J.; Worley, B.A.; Dobranich, D. Sandia National Labs., Albuquerque, NM (United States). [1992]. 12p. Sponsored by USDOE, Washington, DC (United States); Department of Defense, Washington, DC (United States); National Aeronautics and Space Administration, Washington, DC (United States). DOE Contract AC04-76DP00789. (IAF–92-0568;CONF-920879–2: World space congress, Washington, DC (United States), 28 Aug - 5 sep 1992). Order Number DE93000754. Source: OSTI; NTIS; INIS; GPO Dep.

A critical enabling technology in the evolutionary development of nuclear thermal propulsion (NTP) is the ability to predict the system performance under a variety of operating conditions. Since October 1991, US (DOE), (DOD) and NASA have initiated critical technology development efforts for NTP systems to be used on Space Exploration Initiative (SEI) missions to the Moon and Mars. This paper presents the strategy and progress of an interagency NASA/DOE/DOD team for NTP system modeling. It is the intent of the interagency team to develop several levels of computer programs to simulate various NTP systems. An interagency team was formed for this task to use the best capabilities available and to assure appropriate peer review. The vision and strategy of the interagency team for developing NTP system models will be discussed in this paper. A review of the progress on the Level 1 interagency model is also presented.

539 (SAND–92-2049C) **Handling effluent from nuclear thermal propulsion system ground tests.** Shipers, L.R.; Allen, G.C. Sandia National Labs., Albuquerque, NM (United States). 9 Sep 1992. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. (CONF-9209177–2: Nuclear power engineering in space nuclear rocket engines, Kazakhstan (Russian Federation), 22-26 Sep 1992). Order Number DE93000752. Source: OSTI; NTIS; INIS; GPO Dep.

A variety of approaches for handling effluent from nuclear thermal propulsion system ground tests in an environmentally acceptable manner are discussed. The functional requirements of effluent treatment are defined and concept options are presented within the framework of these requirements. System concepts differ primarily in the choice of fission-product retention and waste handling concepts. The concept options considered range from closed cycle (venting the exhaust to a closed volume or recirculating the hydrogen in a closed loop) to open cycle (real time processing and venting of the effluent). This paper reviews the different methods to handle effluent from nuclear thermal propulsion system ground tests.

541 (INFO–0318) **Review of 12-hour shifts at nuclear generating stations: Final report.** Smiley, A. (Human Factors Association of Canada, Toronto, ON (Canada)); Moray, N.P. Atomic Energy Control Board, Ottawa, ON (Canada). Apr 1989. 63p. Project 2.131.1. Order Number DE93604017. Source: OSTI; NTIS (US Sales Only); INIS.

This project reviewed the practice of 12-hour shift work schedules at nuclear power plants, and its relationship to safety. The current literature was examined for information on accidents, fatigue and personal preferences. Interviews with operators and maintainers showed that these groups had attitude and preference differences related to both 12 hour shift schedules and overtime work opportunities. Several factors related to 12-hour schedules were identified which could affect safety, but which have not been adequately considered. (24 refs.).

The purpose of this study is to clarify the role of nuclear power generation under the circumstances of growing concerns about environmental impact and to help decision making in electricity sector. In this study, efforts are made to estimate electricity power generation cost of major power options by incorporating additional cost to reduce environmental impact and to suggest an optimal plant mix in this case. 2109 Process Heat Reactors

544 (AECL–9975) **Co-operation between Canada and Hungary on the application of the SLOWPOKE energy system to district heating in eastern Europe.** Kay, R.E.; Halzl, J.; Sigmond, G.; Takats, F.; Bakacs, I. Atomic Energy of Canada Ltd., Ottawa, ON (Canada). Jun 1989. 14p. (CONF-8908292–: Post-conference seminar on small and medium-sized nuclear reactors, San Diego, CA (United States), 21-23 Aug 1989). Order Number DE93603905. Source: OSTI; NTIS (US Sales Only); INIS.

The SLOWPOKE Energy System is a nuclear energy source designed to provide up to 10 MWt of heat energy in the form of hot water to medium- and large- size district heating systems. An appropriate grouping of Canadian and Hungarian companies with the support of the Hungarian Ministry of Industry is studying the technical, economic, commercial, and nuclear licensability aspects of the application of the SLOWPOKE Energy System to district heating in Hungary. Results of these studies indicate that there is a significant potential market for SLOWPOKE Energy Systems in existing district heating systems, that the SLOWPOKE Energy System can be readily integrated into such systems, that high capacity factors can be achieved, and that it will be relatively easy to localize the supply of most components and systems.

22 NUCLEAR REACTOR TECHNOLOGY

545 (KAERI/RR–995/91) **Development of the design safety evaluation technology.** Chae, Sung Ki (Korea Atomic Energy Research Inst., Daeduk (Korea, Republic of)); Chang, Won Pyo; Sur, Uk Whan. Korea Atomic Energy Research Inst., Daeduk (Korea, Republic of). Jul 1991. 271p. (In Korean). Order Number DE93605746. Source: OSTI; NTIS (US Sales Only); INIS.

The objective of this research is to develop a deterministic and probabilistic safety assessment technology for reactor safety. As KOSAC/MOD1 which has been developed for the deterministic safety assessment and uses one dimensional, 3-equation, homogeneous thermal-hydraulic model with drift flux correlation, is an early version, so there are some limitations for its application and it has not been verified sufficiently. For its improvement and futher verification, CATHARE computer code and BETHSY experiments are also analyzed. The research areas of the probabilistic safety assessment(PSA) are development of a computer code package to perform a consistent PSA and computerized systems which aid the analysis in performance of PSA e.g., in the analysis of common-cause failure and HREP in the analysis of human reliability. A new technology such as artificial intelligence(AI) is also utilized in order to improve present PSA technique. (Author).

546 (KAERI/RR–1003/90) **The development of load-following technology in nuclear power plants.** Hwang, Woan (Korea Atomic Energy Research Inst., Daeduk (Korea, Republic of)); Kuh, Jung Eui; Hwang, Hae Ryong. Korea Atomic Energy Research Inst., Daeduk (Korea, Republic of). Jul 1991. 489p. (In Korean). Order Number DE93605745. Source: OSTI; NTIS (US Sales Only); INIS.

On the 1st year of the project initiated since 1988, a feasibility study on the application of advanced load-follow technologies to domestic nuclear power plants was performed with surveying related literature operation strategy for domestic grid requirements was suggested, and associated design methodology and evaluation scheme were established. During the final year of the project, a new load-follow operation strategy for the Korean Standardized Nuclear Power Plants(KSNPPs), called Mode K, has been developed as a major part of the project. The validity of its design methodology and evaluation scheme has been evaluated through the technical consultation of Framatome. Also, the impacts of Mode K operation have been evaluated on fuel, core and system. In addition, the design requirements for Mode K operation were prepared for the commercial implementation phase. (Author).

2201 Theory and Calculation

547 (AECL–10146-1) **Validation of KENO V.a for criticality safety calculations of low-enriched uranium-235 systems.** McCamis, R.H. Atomic Energy of Canada Ltd., Pinawa, MB (Canada). Whiteshell Nuclear Research Establishment. Feb 1991. 32p. Order Number DE93603802. Source: OSTI; NTIS (US Sales Only); INIS.

The criticality safety analysis program KENO V.a, together with a 27-energy-group ENDF/B-IV criticality safety cross-section library, has been validated by comparison of calculations with the experimental results from critical benchmarks dealing with low-enriched ($\leq$ 5 wt%) ^{235}U systems, obtained both from the literature and from recent AECL Research experiments with the SLOWPOKE Demonstration Reactor. The combination of the code and this data library is shown to be very suitable for criticality safety analyses of low-enriched ^{235}U systems, with mean values of the calculated reactivities being within 1% of the experimental values. (6 figs., 3 tabs., 37 refs.).

548 (AECL–10146-2) **Validation of KENO V.a for criticality safety calculations involving WR-1 fast-neutron fuel arrangements.** Gauld, I.C. Atomic Energy of Canada Ltd., Pinawa, MB (Canada). Whiteshell Nuclear Research Establishment. Jul 1991. 24p. Order Number DE93603803. Source: OSTI; NTIS (US Sales Only); INIS.

The KENO V.a criticality safety code, used with the SCALE 27-energy-group ENDF/B-IV-based cross-section library, has been validated for low-enriched uranium carbide (UC) WR-1 fast-neutron (FN) fuel arrangements. Because of a lack of relevant experimental data for UC fuel in the published literature, the validation is based primarily on calculational comparisons with critical experiments for fuel types with a range of enrichments and densities that cover those of the FN UC fuel. The ability of KENO V.a to handle the unique annular pin arrangement of the WR-1 FN fuel bundle was established using a comparison with the MCNP3B code used with a continuous-energy ENDF/B-V-based cross-section library. This report is part of the AECL–10146 report series documenting the validation of the KENO V.a criticality safety code.

In nuclear or shielding design analysis for reactors or other facilities, nuclear data are one of the primary importances. Research project for nuclear data evaluation and their effective applications has been continuously performed. The objectives of this project are (1) to compile the latest evaluated nuclear data files, (2) to establish their processing code systems, and (3) to evaluate the multigroup constant library using the newly compiled data files and the code systems. As the results of this project, ENDF/B-VI Supplementary File including important nuclides, JENDL-3.1 and JEF-1 were compiled, and ENDF-6 international computer file format for evaluated nuclear data and its processing system NJOY89.31 were tested with ENDF/B-VI data. In order to test an applicability of the newly released data to thermal reactor problems, a number of benchmark calculations were performed, and the results were analyzed. Since preliminary benchmark testing of thermal reactor problems have been made the newly compiled data are expected to be positively used to develop advanced reactors. (Author).

553 (BNL–47071) **Independent verification of tank volume measurements by pressure-volume authentication.** Suda, S.C.; Keisch, B. Brookhaven National Lab., Upton, NY (United States). [1992]. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016. (TSO–92-1;CONF-9207102–68: Institute of Nuclear Materials Management (INMM) annual meeting, Orlando, FL (United States), 19-22 Jul 1992). Order Number DE92040680. Source: OSTI; NTIS; INIS; GPO Dep.

Brookhaven National Laboratory has developed a portable pressure-volume authenticator** as a standard and means of checking the functionality and quality of bubbler-probe volumetric devices. The pressure-volume authenticator (PVA) consists of an automated electromanometer system that is controlled by a laptop computer, and a transportable volumetric artifact. A portable pressure gage is connected, via a scanivalve, to the operator's bubbler-probe system and independently measures all bubbler probes. The transportable volumetric artifact is a one-meter high vessel equipped with bubble-probes, computer controlled air-purge rotameters, and platinum resistance (RTD) thermometer. High quality measurements are obtained by use of a fast sampling technique and sophisticated software developed under this program. The computer software performs the following functions: (a) instrument control, (b) data acquisition, (c) on-line graphical and numerical display of measurement data, and (d) detailed data analysis. The device also may provide hands-on training for inspectors and plant operators in high quality volumetric data collection and analysis. A field demonstration of the automated electromanometer system was conducted on the PETRA input accountancy tank, JRC-Ispra in November 1991.

554 (CEA-CONF–10965) **Presentation of the Fabrice process: validation by the Prisca experiments and refabrication experience up to 1991.** Blanc, J.Y.; Vouillot, M.; Royer, J. CEA Centre d'Etudes de Saclay, 91 - Gif-sur-Yvette (France). Dept. de Mecanique et de Technologie. 1992. 16p. (CONF-9205116–: International conference on irradiation technology, Saclay (France), 20-22 May 1992). Order Number DE93721208. Source: OSTI; NTIS (US Sales Only); INIS.

This paper is intended to update the manufacturing experience in the FABRICE process used in SETIC/LECR for refabrication of short fuel rods for ramp testing. It includes the document written in August 1986 by Mr. Jacques ROYER on qualification of FABRICE rods during PRISCA experiments. The updating is constituted by the list of the rods manufactured up to 1991, and by some technical considerations on this process.

555 (DOE/ER/13030–2) **Damage dosimetry and embrittlement monitoring of nuclear pressure vessels in real time by magnetic properties measurement: Technical progress report for year 2, October 1, 1991–September 30, 1992.** Stubbins, J.F.; Ougouag, A.M.; Williams, J.G. Illinois Univ., Urbana, IL (United States). Dept. of Nuclear Engineering. 1 Jul 1992. 17p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-90ER13030. Order Number DE93000422. Source: OSTI; NTIS; GPO Dep.

The objective of this project is to develop a technique for real-time monitoring of neutron dose and of the onset and progression of embrittlement in operating nuclear pressure vessels. The technique relies on the measurement of magnetic properties of steel and other magnetic materials which are extremely sensitive to radiation-induced properties changes. The approach being developed here is innovative and unique. It promises to be readily applicable to all existing and planned reactor structures. The significance of this program is that it addresses a major concern in the operation of existing nuclear pressure vessels. The development of microscopic defect clusters during irradiation in the nuclear pressure vessel beltline region leads to an increase in material yield strength and a concomitant decrease in ductility, or ability to absorb energy in fracture (i.e. fracture toughness). This decrease in fracture toughness is alarming since it may impair the ability of the pressure vessel to resist fracture during unusual loading situations.

556 (EUR–14039, pp. 114-120) **Hydrogen risk: studies about detonation phenomena via Plexus code.** Forestier, A.J. (CEA Centre d'Etudes de Saclay, 91 - Gif-sur-Yvette (France). Dept. de Mecanique et de Technologie). Commission of the European Communities, Luxembourg (Luxembourg). 1992. (CONF-9103264–: Proceedings of a Workshop on Hydrogen behaviour and mitigation in water-cooled nuclear power reactors, Brussels (Belgium), 4-8 Mar 1991). In *Hydrogen behaviour and mitigation in water-cooled nuclear power reactors.* 370p. Order Number DE93721166. Source: OSTI; NTIS (US Sales Only); INIS.

The hydrogen risk in nuclear reactor is an extensive field of study which includes several aspects like burning via deflagrations or detonations and containment integrity. An extensive amount of work has already been devoted to this problem. The scope of this paper is to present some subjects related to hydrogen risk which are in progress at CEA/DMT, associated to computation of detonation shock waves in confined or semi-confined volumes and the resulting impulsive load on the containments.

557 (EUR–14039, pp. 121-128) **Deflagration tests of an air-hydrogen-steam mixture with not uniformly distributed steam.** Carcassi, M.N. (Pisa Univ. (Italy). Dipt. di Costruzioni Meccaniche e Nucleari). Commission of the European Communities, Luxembourg (Luxembourg). 1992. (CONF-9103264–: Proceedings of a Workshop on Hydrogen behaviour and mitigation in water-cooled nuclear power reactors, Brussels (Belgium), 4-8 Mar 1991). In *Hydrogen behaviour and mitigation in water-cooled nuclear power reactors.* 370p. Order Number DE93721166. Source: OSTI; NTIS (US Sales Only); INIS.

Almost all the experimental tests carried out around the world to investigate the behaviour of a combustion of air-hydrogen-steam mixture, have been made with a uniform mixture. In the case of a severe accident of a nuclear reactor with production of hydrogen, inside the containment of the reactor, the air-hydrogen-steam mixture might be not uniform, for example in the case were containment spray fails to work. This behaviour is clearly showed in the HDR experiments were stratification were found during the experiments. To examine this aspect a series of 10 tests was undertaken at the Department of Mechanical and Nuclear Constructions of the University of Pisa. The experimental apparatus

used was the HYDRO-SH (a small apparatus of 0.5 m^3), whereas in the past almost 100 tests of combustion of air-hydrogen-steam mixture uniformly distributed were done. The new test data was compared with the previous tests in terms of pressure efficiencies. The preliminary results show that with a steam concentration less than 30% no difference exist between the new and the old tests. With a steam concentration of 50% the pressure efficiencies of tests with not uniformly distributed steam is greater than equivalent test where the steam was well distributed.

558 (EUR–14039, pp. 129-140) **Flame acceleration in hydrogen/air/steam mixtures in the presence of repeated obstacles in a closed volume.** Kumar, R.K. (Atomic Energy of Canada Ltd., Pinawa, MB (Canada). Whiteshell Nuclear Research Establishment); Bowles, E.M. Commission of the European Communities, Luxembourg (Luxembourg). 1992. (CONF-9103264–: Proceedings of a Workshop on Hydrogen behaviour and mitigation in water-cooled nuclear power reactors, Brussels (Belgium), 4-8 Mar 1991). In *Hydrogen behaviour and mitigation in water-cooled nuclear power reactors.* 370p. Order Number DE93721166. Source: OSTI; NTIS (US Sales Only); INIS.

Experiments were carried out in a 5.7-m high, 1.5-m diameter cylindrical vessel to determine the effect of obstacles in the flame path on the flame speed and peak pressure. The experiments were performed at 100 kPa and 128 deg C with hydrogen/air/steam mixtures containing 12 to 20% hydrogen and up to 30% steam by volume. For a given hydrogen concentration, the results indicate that the flame speed and the peak pressures decrease as the steam concentration increases. The extent of reduction in flame speed, however, depends on the hydrogen concentration. The mitigating effect of steam on the flame acceleration is highest at low hydrogen concentrations and least at high hydrogen concentrations.

559 (EUR–14039, pp. 240-246) **Concept and qualification of a combined system for hydrogen mitigation after severe accidents.** Heck, R. (Siemens AG Unternehmensbereich KWU, Offenbach am Main (Germany)). Commission of the European Communities, Luxembourg (Luxembourg). 1992. (CONF-9103264–: Proceedings of a Workshop on Hydrogen behaviour and mitigation in water-cooled nuclear power reactors, Brussels (Belgium), 4-8 Mar 1991). In *Hydrogen behaviour and mitigation in water-cooled nuclear power reactors.* 370p. Order Number DE93721166. Source: OSTI; NTIS (US Sales Only); INIS.

Pursuant to the current discussion regarding options for reducing the risk of loss of containment integrity following a severe accident, this report describes the concepts of controlled ignition and catalytic recombination. The current status of these two concepts is presented and an evaluation performed of their possible applications.

560 (EUR–14039, pp. 274-285) **The reaction between H_2 and O_2 over tungsten carbide catalysts.** Guskey, G.J. (Stanford Univ., CA (United States)); Boudart, M.; Frennet, A. Commission of the European Communities, Luxembourg (Luxembourg). 1992. (CONF-9103264–: Proceedings of a Workshop on Hydrogen behaviour and mitigation in water-cooled nuclear power reactors, Brussels (Belgium), 4-8 Mar 1991). In *Hydrogen behaviour and mitigation in water-cooled nuclear power reactors.* 370p. Order Number DE93721166. Source: OSTI; NTIS (US Sales Only); INIS.

The stationary-state reaction between H_2 and O_2 either in excess H_2 or O_2 has been studied in a flow recirculation reactor over unsupported powders of tungsten carbide with high specific surface area and microporous texture for up to 40 h. Areal rates, v_a are first order in the concentration of the limiting reactant and zero order in the concentration of the excess reactant between 273 and 600 K and near atmospheric pressure. Rates are referred to the number of sites counted by titration of preadsorbed oxygen with H_2 at room temperature. This number is multiplied by the surface area per W atom to obtain v_a. These tungsten carbides exhibit a microporous structure. A break in the Arrhenius diagram near 450 K is observed. Below 450 K either in excess H_2 or O_2 capillary condensation of product water causes the micropores of the catalyst to become blocked. Thus, the reaction occurs only in the mesopores which account for about 10% of the total specific surface area, S_g. Above 450 K, water leaves the micropores and the apparent v_a increases as active sites within the micropores become accessible to the reactants. In excess O_2 at 273 K, the first order rate constant of v_a based on active area of mesopores, is two times higher for microporous αWC than that for platinum.

561 (EUR–14039, pp. 286-296) **Hydrogen mitigation using catalyst modules.** Behrens, U. (Battelle-Institut e.V., Frankfurt am Main (Germany)); Seidler, M.; Wolff, U. Commission of the European Communities, Luxembourg (Luxembourg). 1992. (CONF-9103264–: Proceedings of a Workshop on Hydrogen behaviour and mitigation in water-cooled nuclear power reactors, Brussels (Belgium), 4-8 Mar 1991). In *Hydrogen behaviour and mitigation in water-cooled nuclear power reactors.* 370p. Order Number DE93721166. Source: OSTI; NTIS (US Sales Only); INIS.

Large amounts of hydrogen may be released into the containment atmosphere of a nuclear plant during a postulated loss-of-coolant accident (LOCA). NIS has developed, at the request of RWE-Energie AG, a catalyst module that is designed to mitigate the released hydrogen sufficiently, provided a large number of these modules are suitably located inside the containment. In this way, during an accident, hydrogen concentration will essentially remain below the limit of inflammability. Containment malfunction due to hydrogen combustion may therefore be ruled out.

562 (EUR–14039, pp. 305-316) **Removal of hydrogen with catalytic recombiners during severe accident situations.** Chakraborty, A.K. (Gesellschaft fuer Reaktorsicherheit mbH (GRS), Koeln (Germany)). Commission of the European Communities, Luxembourg (Luxembourg). 1992. (CONF-9103264–: Proceedings of a Workshop on Hydrogen behaviour and mitigation in water-cooled nuclear power reactors, Brussels (Belgium), 4-8 Mar 1991). In *Hydrogen behaviour and mitigation in water-cooled nuclear power reactors.* 370p. Order Number DE93721166. Source: OSTI; NTIS (US Sales Only); INIS.

A passive device based on the catalytic transformation of hydrogen to water, a recombiner has been conceptually designed to reduce the potential danger of hydrogen burn in the containment during severe accidents. Extensive experiments on small and large scale under temperature, pressure and atmospheric conditions simulating the severe accident situations revealed positive results even in the presence of catalytic poisons like CO, I and Cs_2CO_3 and aerosols. The application of catalytic recombiners is associated with numerous advantages like the promotion of convection, dissolution of stratified layers, and protection of the functionability of instruments by preventing burns. This paper is going to address some of the results derived from the experiments on catalytic recombination of hydrogen and oxygen from air.

563 (EUR–14039, pp. 317-323) **Catalytic removal of hydrogen in humid, hydrogen-air gas streams.** Koroll, G.W. (Atomic Energy of Canada Ltd., Pinawa, MB (Canada). Whiteshell Nuclear Research Establishment); Lau, D.; Graham, W.R.C. Commission of the European Communities, Luxembourg (Luxembourg). 1992. (CONF-9103264–: Proceedings of a Workshop on Hydrogen behaviour and mitigation in water-cooled nuclear power reactors, Brussels (Belgium), 4-8 Mar 1991). In *Hydrogen behaviour and mitigation in water-cooled nuclear power reactors.* 370p. Order Number DE93721166. Source: OSTI; NTIS (US Sales Only); INIS.

Performance tests are described of a wetproofed catalytic hydrogen recombiner in humid and condensing forced-air streams. The catalyst element, of AECL design, shows good resistance to water and achieves conversion efficiencies approaching 100% for hydrogen concentrations as low as 1% with gas residence times in the catalyst element of 100 ms or less. In these terms, the catalyst appears capable of high- throughput hydrogen removal in a post-accident containment atmosphere.

564 (INFO–0316) **Assessment of IAEA safety series no. 75-INSAG-3 - "basic safety principles for nuclear power plants".** Atomic Energy Control Board, Ottawa, ON (Canada). Advisory Committee on Nuclear Safety. Jan 1989. 28p. (In English, French). (ACNS–16;CCSN–16.). Order Number DE93603807. Source: OSTI; NTIS (US Sales Only); INIS.

The International Atomic Energy Agency Safety Series No. 75-INSAG–3, 'Basic Safety Principles for Nuclear Power Plants' is reviewed in the light of the Advisory Committee on Nuclear Safety reports ACNS–2, 'Safety Objectives for Nuclear Activities in

Canada', and ACNS–4, 'Recommended General Safety Requirements for Nuclear Power Plants'. The INSAG safety objectives are consistent with the safety objectives stated in ACNS–2 but are less general, applying only to nuclear power plants. The INSAG safety principles are, in general, consistent with the requirements stated in ACNS–4 but put more emphasis on 'safety culture'. They give little attention to reactor plant effluents, waste management, or decommissioning. (fig., 5 refs.).

578 (KAERI/RR–1048/91) **The development of detection technique for fatigue crack due to thermal stratification phenomena in RCS piping.** Lee, Sam Lai (Korea Atomic Energy Research Inst., Daeduk (Korea, Republic of)); Kim, Byoung Chul; Lim, Hyung Taik; Lee, Jong Po; Chang, Kee Ok. Korea Atomic Energy Research Inst., Daeduk (Korea, Republic of). Jan 1992. 89p. (In Korean). Order Number DE93605749. Source: OSTI; NTIS (US Sales Only); INIS.

Piping stress analysis has been performed using computer code ANSYS in order to find the stress profile considering thermal stratification phenomena. This kind of analysis can be a useful tool to assist inspection engineer to choose right method and area of inspection during in-service inspection of nuclear power plants. Mechanical fatigue cracks have been generated in order to improve detection reliability of defect ultrasonically since the defects that have been searched for are mostly related to fatigue cracks in pressurized water reactors. (Author).

579 (KAERI/RR–1053/91) **Permanent pool cavity seal design development.** Kim, In Yong (Korea Atomic Energy Research Inst., Daeduk (Korea, Republic of)); Kim, Bum Sik; Shin, Tae Myung; Lee, Moon Ok; Lee, Kyu Man. Korea Atomic Energy Research Inst., Daeduk (Korea, Republic of). Feb 1992. 78p. (In Korean). Order Number DE93605750. Source: OSTI; NTIS (US Sales Only); INIS.

The existing pool cavity seal assembly design of every Korean Nuclear Power Plant and the state-of-art of the PPS development of the foreign NSSS suppliers were surveyed, and the design requirements for PPS were established using those for YGN 3 and 4 as reference. The optimization technique is applied in order to get the best sectional shape which can minimize maximum stress under the design loads. The stress analysis and the fatigue analysis of the developed PPS were carried out for the loads of each plant condition to evaluate the integrity during the plant lifetime. At the same time the structural design was compared to those of the PPS of the foreign NSSS suppliers. (Author).

580 (KAERI/RR–1080/91) **Development of operating transients monitoring system for primary components of nuclear power plants.** Kwack, Eun Ho (Korea Atomic Energy Research Inst., Daeduk (Korea, Republic of)); Sur, Uk Hwan. Korea Atomic Energy Research Inst., Daeduk (Korea, Republic of). Jan 1992. 159p. (In Korean). Order Number DE93605751. Source: OSTI; NTIS (US Sales Only), INIS.

In this study, the application of on-line fatigue monitoring system for tracking fatigue usage in operating nuclear power plants is described. The system, which uses Green's function approach, can operate on microcomputer like IBM compatible personal computers. Since the developed system can be used to automatically compute cumulative fatigue usage in real time and estimate the integrity of a plant during plant operation, this system provides an important information for design improvement and contributes to plant life extension. The Green's function approach shows good agreement with conventional finite element analysis and contributes to improving solution technique for transient thermal stress problems for use in real time fatigue monitoring. The approach shows a remarkable reduction in computation time compared with finite element technique. The system enables optimization of the inspection, maintenance and replacement, and will ultimately contribute to plant life extension. (Author).

581 (KAERI/RR–1082/91) **Study on the irradiation damage in the reactor component materials.** Choi, Sun Pil (Korea Atomic Energy Research Inst., Daeduk (Korea, Republic of)); Choi, Kwon Jae; Park, Moon Ho; Kang, Sang Shim. Korea Atomic Energy Research Inst., Daeduk (Korea, Republic of). Feb 1992. 52p. (In Korean). Order Number DE93605752. Source: OSTI; NTIS (US Sales Only); INIS.

The charpy impact test has been studied and a theoretical expression for analyzing charpy impact test data was deduced and called the KAERI method. A number of surveillance data(the irradiated charpy data) were analyzed by the KAERI method and we obtained the results that (1) all the charpy impact data have shown the Debye characteristics, (2) the activation energy has unique values and changes to other values by step after irradiation, (3) the characteristic temperature, a measure of brittleness, varies in a wide range of temperature depending upon the heat treatment conditions, and (4) the radiation embrittlement should be studied systematically by a traditional method such as the internal friction. (Author).

582 (NUREG/CP–0122-Vol.2) **Aging research information conference: Proceedings: Volume 2.** Beranek, A. (comp.). Nuclear Regulatory Commission, Washington, DC (United States). Office of Nuclear Regulatory Research. Sep 1992. 461p. Sponsored by Nuclear Regulatory Commission, Washington, DC (United States). (CONF-920375–Vol.2: Aging research information conference, Rockville, MD (United States), 24-27 Mar 1992). Source: OSTI; NTIS; INIS; GPO.

This conference was held to disseminate research results in the area of nuclear power plant aging from programs sponsored by the Office of Nuclear Regulatory Research, US Nuclear Regulatory Commission. The conference also provided an opportunity for engineers and scientists from around the world to exchange technical information and discuss future international cooperation. The papers and talks appear in the order in which they were presented at the conference, and they are grouped by technical session in two volumes. Volume 1 contains the proceedings of March 24 and 25, while Volume 2 contains the proceedings of March 26 and 27. Volume 2 contains 21 papers and a panel discussion. The papers are processed separately for the database.

583 (NUREG/CR–5121) **Experimental results from pressure testing a 1:6-scale nuclear power plant containment.** Horschel, D.S. (Sandia National Labs., Albuquerque, NM (United States)). Nuclear Regulatory Commission, Washington, DC (United States). Div. of Engineering; Sandia National Labs., Albuquerque, NM (United States). Jan 1992. 142p. Sponsored by Nuclear Regulatory Commission, Washington, DC (United States). DOE Contract AC04-76DP00789. (SAND–88-0906). Source: OSTI; NTIS; INIS; GPO.

Includes 27 sheets of 24x reduction microfiche.

This report discusses the testing of a 1:6-scale, reinforced-concrete containment building at Sandia National Laboratories, in Albuquerque, New Mexico. The scale-model, Light Water Reactor (LWR) containment building was designed and built to the American Society of Mechanical Engineers (ASME) code by United Engineers and Constructors, Inc., and was instrumented with over 1200 transducers to prepare for the test. The containment model was tested to failure to determine its response to static internal

overpressurization. As part of the US Nuclear Regulatory Commission's program on containment integrity, the test results will be used to assess the capability of analytical methods to predict the performance of containments under severe-accident loads. The scaled dimensions of the cylindrical wall and hemispherical dome were typical of a full-size containment. Other typical features included in the heavily reinforced model were equipment hatches, personnel air locks, several small piping penetrations, and a ihin steel liner that was attached to the concrete by headed studs. In addition to the transducers attached to the model, an acoustic detection system and several video and still cameras were used during testing to gather data and to aid in the conduct of the test. The model and its instrumentation are briefly discussed, and is followed by the testing procedures and measured response of the containment model. A summary discussion is included to aid in understanding the significance of the test as it applies to real world reinforced concrete containment structures. The data gathered during SIT and overpressure testing are included as an appendix.

584 (NUREG/CR–5416) **Technical evaluation of Generic Issue 113: Dynamic qualification and testing of large bore hydraulic snubbers.** Nitzel, M.E. (EG and G Idaho, Inc., Idaho Falls, ID (United States)); Ware, A.G.; Page, J.D. Nuclear Regulatory Commission, Washington, DC (United States). Div. of Safety Issue Resolution; EG and G Idaho, Inc., Idaho Falls, ID (United States). Sep 1992. 402p. Sponsored by Nuclear Regulatory Commission, Washington, DC (United States). DOE Contract AC07-76ID01570. (EGG–2571). Source: OSTI; NTIS; INIS; GPO.

This report summarizes the work performed by the Idaho National Engineering Laboratory (INEL) for the Nuclear Regulatory Commission to resolve Generic Issue 113, "Dynamic Qualification and Testing of Large Bore Hydraulic Snubbers (LBHSs)." The report evaluates LBHS reliability and the need to improve that reliability. The INEL gathered and reviewed information regarding snubber (including LBHS) numbers and uses, design, environmental qualification, operating experience, and the effects of various snubber reduction programs. Limited qualitative and quantitative analyses were performed regarding potential LBHS single failures. A list of potential improvements to LBHS reliability was generated and each item on the list was evaluated by probabilistic risk and cost/benefit analyses. Eleven recommendations were made; five applicable to existing and future plants, five applicable only to future plants, and one for further "single-failure" research.

588 (JINR-R–2-91-422) **Dependence of electronuclear characteristics on ^{239}Pu and ^{235}U concentration.** Barashenkov, V.S.; Sosnin, A.N.; Shmakov, S.Yu. Joint Inst. for Nuclear Research, Dubna (Russian Federation). Lab. of Computing Techniques and Automation. 1991. 10p. (In Russian). Order Number DE93605760. Source: OSTI; NTIS (US Sales Only); INIS.

In case of incident protons at T_p=1 GeV differential and integral characteristics of electronuclear process in uranium reactor with Na coolant, lead foretarget and different concentrations of ^{239}Pu and ^{235}U are calculated by means of the Monte-Carlo method. Addition of these nuclei greatly increases the intensity of plutonium production and heat generation. At high enrichment, if uranium blanket is not used, plutonium production stops and the system works as a intensive neutron source. 3 refs.; 8 figs.; 4 tabs.

589 (KAERI/RR–1001/90) **Development of design technology for advanced pressurized water reactor: Development of safety assessment methodology.** Chae, Sung Ki (Korea Atomic Energy Research Inst., Daeduk (Korea, Republic of)); Cho, Sung Won; Park, Chang Kyu. Korea Atomic Energy Research Inst., Daeduk (Korea, Republic of). Jul 1991. 259p. (In Korean). Order Number DE93605761. Source: OSTI; NTIS (US Sales Only); INIS.

The evaluation method of containment integrity and source terms in nuclear power plant were systematized. First, PRA level 2 procedure which provides the procedures of the containment analysis was developed. The containment event tree method which can assess the severe accident phenomena, the mode of containment failure, and source terms was proposed. The new proposed CET employed simple event tree which is supported by supporting tree on quantification. It can resolve the inter-dependency between top events and/or supporting events. Some Term Code Package was selected as means of evaluation of source terms. New guidance material was prepared to help easy use of STCP. (Author).

590 (KAERI/RR–1004/90) **Development of flow test technology for nuclear fuel: Development of flow test technology for nuclear fuel.** Chung, Moon Ki (Korea Atomic Energy Research Inst., Daeduk (Korea, Republic of)); Cha, Jong Hoi; Yang, Sun Kyu. The objective of this project is to design and construct test facilities for the thermal-hydraulic tests required in KAERI nuclear fuel(PWR, CANDU, KMRR) development program. (Author).

591 (UJV–9667-T) **Simulation of the CORA-13 experiment by the FRAS-SFD computer code in blind conditions.** Belovsky, L.; Valach, M. Ustav Jaderneho Vyzkumu CSKAE, Rez (Czechoslovakia). May 1992. 69p. Order Number DE93605764. Source: OSTI; NTIS (US Sales Only); INIS.

The CORA-13 experiment has been chosen by OECD-CSNI as International Standard Problem No. 31 (ISP-31). The general objectives of ISP-31 were to analyze the heatup and meltdown phase of a PWR-type fuel element in the CORA facility, and to examine the predictability and correctness of the severe accident computer codes used. This report summarizes the Czechoslovak contribution to ISP-31 using the FRAS-SFD computer code. A short description of the code is presented. The behavior of a single fuel rod (simulator 3.3 of the CORA-13 bundle) was simulated between 3000 and 4500 s up to the assumed onset of relocation of molten material, which was not modeled in the code. The calculated results confirmed the characteristic feature of the CORA experiments - movement of the hot zone from the top towards the bottom of the bundle. At 4500 s the cladding was nearly completely converted to ZrO_2 in the upper half of the bundle. The fraction of UO_2 dissolved in the molten cladding reached at most approx. 4.3%. The calculation indicated a significant sensitivity to the temperature of tetragonal-to-cubic ZrO_2 transformation above which the oxidation kinetics accelerates. (author) 1 tab., 28 refs., 34 figs.

592 (BARC–1991/E/021) **VME bus based microcomputer system boards.** Chandra, A.K. (Bhabha Atomic Research Centre, Bombay (India). Reactor Control Div.); Ganesh, G.; Mayya, Anuradha; Chachondia, A.S.; Premraj, M.K. Bhabha Atomic Research Centre, Bombay (India). 1991. 48p. Order Number DE93605767. Source: OSTI; NTIS (US Sales Only); INIS.

Several operator information systems for nuclear plants has been developed in the Division and these have involved extensive use of microcomputer boards for achieving various functions. Standard VME bus based boards have been developed to provide the most used functions. These boards have been fabricated and tested and used in several systems including Channel Temperature Monitoring systems, Disturbance Recording Systems etc. and are also proposed to be used in additional systems under developement. The use of standard bus and boards provides considerable savings in engineering time, prototyping, testing and evaluation costs, and maintenance support. This report desribes the various boards developed and the functions available on each. (author). 4 refs., 11 figs., 3 appendixes.

593 (DOE/ER/12824–2) **Enhancing nuclear power plant performance through the use of artificial intelligence: Second annual report, June 1, 1989–May 31, 1990.** Maren, A.J.; Miller, L.F.; Tsoukalas, L.H.; Uhrig, R.E.; Upadhyaya, B.R. Tennessee Univ., Knoxville, TN (United States). Dept. of Nuclear Engineering. 15 Jun 1990. 140p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG07-88ER12824. Order Number DE92040991. Source: OSTI; NTIS; INIS; GPO Dep.

The objective of this research is to advance the state-of-the-art of applying artificial intelligence technology (both expert systems and neural networks) to enhancing the performance (safety, efficiency, control and management) of nuclear power plants. A second, but equally important, objective is to build a broadly based critical mass of expertise in the artificial intelligence field that can be brought to bear on the technology of nuclear power plants. This means the production of graduates at the B.S., M.S., and Ph.D. levels in Nuclear Engineering and related fields. The research undertaken for this program is particularly appropriate for the M.S. theses and Ph.D. dissertations. A third objective is to transfer the technology developed to the "nuclear power community," as well as the "scientific and technological community," through publications in appropriate journals and proceedings and through presentations at national and international meetings.

This memorandum discusses the procurement of parts for control actuator mechanisms. The lack of a set design specification is discussed in regard to all reactors.

597 (ECN-RX–91-057) **Operational experiences on the Borssele nuclear power plant using computer based surveillance and diagnostic system on-line: Presented at the Symposium on Nuclear Reactor Surveillance and Diagnostics, 19-24 May 1991, Gatlingburg, Tennessee, USA.** Turkcan, E. (Netherlands Energy Research Foundation (ECN), Petten (Netherlands)); Quaadvliet, W.H.J.; Peeters, T.T.J.M.; Verhoef, J.P. Netherlands Energy Research Foundation (ECN), Petten (Netherlands). Jun 1991. 14p. (CONF-910535–: 6. specialists meeting on reactor noise (SMORN), Gatlinburg, TN (United States), 19-24 May 1991). Order Number DE93603833. Source: OSTI; NTIS; INIS.

The on-line monitoring and diagnostics system of Borssele nuclear power plant (NPP), designed and established by the ECN Energy Research Foundation, has been operating continuously since 1983. The system is extended in form of multiprocessing, multi-tasking structure performing real-time monitoring, on-line reactor parameters' calculation, data-base preparation for expert systems and providing early information on possible malfunctions even in the incipient stage making alert by passive alarms. The system realized has already been operating in the course of 7 fuel cycles of the reactor starting from start-up through normal power operation. An expert system operating on the VAX work station is added to the surveillance and diagnostics system for data base management of the observed physical parameters relevant to the NPP under supervision. The paper highlights the surveillance and diagnostic modules involved, in their actual hierarchical form in use, presents theoretical considerations applied to the design of the surveillance system together with the results obtained through the 12th to 17th fuel cycles of the NPP including start-ups and shut-downs and reveals the experience thus gained by both utility and ECN through the application of the system described. (author). 19 refs.; 4 figs.

598 (INFO–0414) **Communications involving the control room of a nuclear power plant.** MacGregor, J. (Core, Inc., Vancouver, British Columbia (Canada)); Cunningham, B.; Safayeni, F.; Duimering, R. Atomic Energy Control Board, Ottawa, ON (Canada). Apr 1992. 95p. Order Number DE93603834. Source: OSTI; NTIS (US Sales Only); INIS.

This study investigated communications within the operations component of a nuclear power plant, with a primary emphasis on control room communications. A structured interview technique was developed following preliminary interviews at the plant, and pretested at AECB headquarters. Patterns were identified from questions asked on communications links, work relationships, miscommunications, procedures, instrumentation and responses to problems. The study was an exploratory one, conducted under a limited budget, to provide background information and to identify areas for further investigation. The report offers recommendations about areas for further research.

Information display system, advanced alarm system and fiber optical communication system were developed to improve the main control room in nuclear power plant. Establishing the new hierachical information structure of plant operation data, plant overview status board(POSB) and digital indicator(DI) were designed and manufactured. The prototype advanced alarm system which employed the new alarm logics and algorithm compared with the conventional alarm system were developed and its effectiveness was proved. Optical communication system which has multi-drop feature and capability of upgrading to large-scale system by using BITBUS communication protocol which is proven technology, were developed. Reliability of that system was enhanced by using distributed control. (Author).

609 (INFO–210(rev.2)) **Radioactive release data from Canadian nuclear generating stations 1872-1987.** Atomic Energy Control Board, Ottawa, ON (Canada). Mar 1989. 44p. Order Number DE93603680. Source: OSTI; NTIS (US Sales Only); INIS.

All nuclear generating stations emit small quantities of radioactive effluent both into the atmosphere and in the form of liquid effluent, into the adjoining water body, be it river, lake or sea. The purpose of this document is to report on the magnitude of these emissions for each nuclear generating station in Canada and to indicate how these emissions compare with the relevant limitations imposed by

the Atomic Energy Control Board as part of its regulatory and licensing program. This report incorporates histograms indicating the annual releases of tritium in air, noble gases, iodine-131, airborne particulates, tritium in water and waterborne gross beta activity for each nuclear generating station. In addition, for Pickering NGS 'A', annual released of carbon-14 are depicted for the years 1986 and 1987. In each case the emission data are compared to the Derived Emission Limit (DEL) in order that the data may be placed in perspective. At present, only Pickering NGS 'A' is required to monitor and report carbon-14 emissions. Environmental monitoring for C-14 is conducted around the Bruce site to determine the environmental impact of its emission and whether effluent monitoring will be necessary in future years. Three nuclear generating stations have been permanently taken out of service during the last few years (Gentilly NGS-1, Douglas Point NGS and NPD NGS). Some small emissions from these sites do still occur, however, due to decontamination and decommissioning operations. (11 tabs., 26 figs.).

Czechoslovak Solar Energy (Czechoslovakia); Ceske Vysoke Uceni Technicke, Prague (Czechoslovakia). 1991. 100p. (In Czech). (CONF-9107237–: Renewable energy sources '91 international conference, Prague (Czechoslovakia), 1 Jul 1991). In *Renewable energy sources '91. Part 3: Conference report, post-deadline papers.* Order Number DE93605594. Source: OSTI; NTIS (US Sales Only); INIS.

In Moravia, smog-type cloudiness is observed to increase at the expense of sunshine. Errors in the evaluation of the sunshine period, which arose from a change in the calculation technique, have been disclosed. The increasing cloudiness is related to the operation of the Dukovany and Jaslovske Bohunice nuclear power plants, whose cooling towers release large amounts of water vapor into air. (M.D.). 2 tabs., 7 refs., 8 figs.

611 (NUREG–0837-Vol.12-No.2) **NRC TLD Direct Radiation Monitoring Network: Progress report, April–June 1992: Volume 12, No. 2.** Struckmeyer, R.; McNamara, N. Nuclear Regulatory Commission, King of Prussia, PA (United States). Region I. Sep 1992. 227p. Sponsored by Nuclear Regulatory Commission, Washington, DC (United States). Source: OSTI; NTIS; INIS; GPO.

This report provides the status and results of the NRC Thermoluminescent Dosimeter (TLD) Direct Radiation Monitoring Network. It presents the radiation levels measured in the vicinity of NRC licensed facilities throughout the country for the second quarter of 1992.

612 (NUREG/CR–2907-Vol.10) **Radioactive materials released from nuclear power plants: Annual report 1989: Volume 10.** Tichler, J. Office of Information Resources Management; Brookhaven National Lab., Upton, NY (United States). Sep 1992. 329p. Sponsored by Nuclear Regulatory Commission, Washington, DC (United States). DOE Contract AC02-76CH00016. (BNL-NUREG–51581-Vol.10). Source: OSTI; NTIS; INIS; GPO.

Releases of radioactive materials in airborne and liquid effluents from commercial light water reactors during 1989 have been compiled and reported. The summary data for the years 1970 through 1988 are included for comparison. Data on solid waste shipments as well as selected operating information have been included. This report supplements earlier annual reports issued by the former Atomic Energy Commission and the Nuclear Regulatory Commission. The 1989 release data are summarized in tabular form. Data covering specific radionuclides are summarized.

613 (PNWD–2017-HEDR) **Selected Hanford reactor and separations operating data for 1960–1964: Hanford Environmental Dose Reconstruction Project.** Gydesen, S.P. Pacific Northwest Lab., Richland, WA (United States). Sep 1992. 276p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE93000483. Source: OSTI; NTIS; INIS; GPO Dep.

The purpose of this letter report is to reconstruct from available information that data which can be used to develop daily reactor operating history for 1960–1964. The information needed for source team calculations (as determined by the Source Terms Task Leader) were extracted and included in this report. The data on the amount of uranium dissolved by the separations plants (expressed both as tons and as MW) is also included in this compilation.

614 (SNV–3931) **Bladder-wrack (Fucus vesiculosus L) as an indicator for radionuclides in the environment of Swedish nuclear power plants.** Neumann, G.; Notter, M. Swedish Environmental Protection Agency, Solna (Sweden). 1991. 38p. Order Number DE93603681. Source: OSTI; NTIS; INIS.

Results from gamma radiation analysis of samples of bladderwrack, Fucus vesiculosus, growing in the aquatic environment of Swedish nuclear power plants, are presented. The concentrations of the main nuclides, viz. ^{60}Co, ^{58}Cu, ^{65}Zn, ^{54}Mn and ^{110}Ag, are reported. Series of samples from the environment of Ringhals (at the Swedish west coast) and of Simpevarp (at the Baltic proper) were collected during the years 1979-1982 and 1981-1982, respectively. The data for ^{60}Co and ^{65}Zn were analysed using a model correlating the concentration of radionuclides in Fucus with the corresponding discharges. Also, on a small series of ^{60}Co data from Simpevarp, a model was tried based on kinetic constants for uptake and elimination. The nuclide concentrations in Fucus as a function of the distance to the point of emission was also studied, as well as transfer factors for the different nuclides. Finally the accuracy which can be expected when using Fucus for checking discharges of radionuclides from a power plant is discussed. 15 refs., 6 figs., 11 tabs.

615 (ANL/CP–74935) **Irradiation performance of full-length metallic IFR fuels.** Tsai, H.; Neimark, L.A. Argonne National Lab., IL (United States). Jul 1992. 16p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-921003–8: International conference on design and safety of advanced nuclear power plants, Tokyo (Japan), 25-28 Oct 1992). Order Number DE92041095. Source: OSTI; NTIS; INIS; GPO Dep.

An assembly irradiation of 169 full-length U-Pu-Zr metallic fuel pins was successfully completed in FFTF to a goal burnup of 10 at.%. All test fuel pins maintained their cladding integrity during the irradiation. Postirradiation examination showed minimal fuel/cladding mechanical interaction and excellent stability of the fuel column. Fission-gas release was normal and consistent with the existing data base from irradiation testing of shorter metallic fuel pins in EBR-II.

616 (DPSP–58-814) **Moderator studies.** Longtin, F.B. (Du Pont de Nemours (E.I.) and Co., Aiken, SC (United States)); Taylor, J. Du Pont de Nemours (E.I.) and Co., Aiken, SC (United States). 19 May 1958. 72p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. (RTR–85). Order Number DE92040821. Source: OSTI; NTIS (US Sales Only); GPO Dep.

Since Jan. 1957, a substantial amount of moderator data have been collected and the technical aspects of the Moderator Studies program have been reevaluate. Reappraisal of the program shows that the major phases should consist of the following: development of a complete battery of adequate methods of moderator analysis; determination of normal values and trends of each of the quantities measured; evaluation of the net rate of introduction of each moderator impurity in terms of process variables and impurity concentrations; setting acceptable limits on impurity concentrations; and development of control methods. The development of analytical methods should be completed within the next 6 months. Source of Na^{24} activity is well understood, and a start has been made in understanding the sources of turbidity. Hypothesis of nonselective corrosion is promising. Reactor operations at low power levels and purification flow rates other than 30 gpm provide opportunity for studying trends in analyses. 3 figs, 14 tabs. (DLC)

617 (DPSP–61-1841) **Effect of CO_2 pD control on area activity levels.** Tope, C.W. Du Pont de Nemours (E.I.) and Co.,

Aiken, SC (United States). 27 Jul 1961. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-76SR00001 ;AC09-89SR18035. (RTR–328). Order Number DE93000488. Source: OSTI; NTIS; GPO Dep.

Aluminum corrosion is a major cause of moderator turbidity and high radioactivity, which interfere with reactor operation and maintenance. The reduction and control of moderator pD was initiated with the P-8 cycle that began on June 25, 1959, in an effort to reduce aluminum corrosion and associated problems. Favorable results prompted the introduction of moderator pD control in all reactor areas. Radiation level measurements made during shutdowns prior to and subsequent to pD control in each area indicate that the program has been effective in reducing process system radiation levels. During the period June 25, 1959, to November 8, 1960, in P-Area the moderator pD was controlled by adding nitric acid to the moderator as required. Since November 8, 1960, the moderator pD in Area has been controlled by the addition of carbon dioxide to the blanket gas. An evaluation of the relative effectiveness of moderator pD control with nitric acid and with carbon dioxide in reducing process system radiation levels during shutdown is presented in this document.

618 (DPSP–61-2291) **Diffusion studies of uranium-aluminum materials: Mark VI-J fuel elements.** Philipp, R.F. Du Pont de Nemours (E.I.) and Co., Aiken, SC (United States). 14 Nov 1961. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-76SR00001 ;AC09-89SR18035. Order Number DE93000471. Source: OSTI; NTIS (US Sales Only); GPO Dep.

A visible change was snoted in the microstucture of Mark VI-J samples containing alloy core (U-Al) after heating at 500 C ($\geq$ 25 days) and 600 C ($\geq$ 2.8 days). Small particles were found along grain boundaries in a narrow zone in the cladding adjacent to the core. $\leq$ 123.8 ppM U^{235} was found in the outer 0.009 in. cladding heated at 500 C, 3.08 ppM at 300 C. In end defect samples containing both alloy core and AlSi, heating at $\geq$ 400 C caused the Si particles in the AlSi microstructure to disappear. Specimens with exposed alloy core were tested at $\leq$ 100 days in boiling deionized water at pH 5.5. No U was detected in solution after 10 days; after 100 days, the max U in solution was 1.6×10^{-3} for 1 $in.^2$ exposed core area. 2 tabs, 5 figs. (DLC)

619 (DPSP–64-2079) **Moderator chemistry.** Jacobsen, W.R. Du Pont de Nemours (E.I.) and Co., Aiken, SC (United States). 17 Dec 1964. 29p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. (RTR–708). Order Number DE92040820. Source: OSTI; NTIS (US Sales Only); GPO Dep.

This report provides the charts used by the writer in the Wilmington talk of November 6, 1964 on the subject of water chemistry. Two additional charts were prepared to answer questions which arose after the meeting and ate included. A brief description of each chart and the photostats are provided. Specific topics covered include: Nitric acid instability - Mark VI-B history, Direct addition of oxygen to moderator, C-7, C-9, K-11, Moderator Parameters L-2 vs K-11, Radioactivity - release to stream, Moderator fission product activity vs Maximum Oxide film thickness, Production mechanisms of higher actinides, Activities - Cm cycle, Alpha activity in C moderator, Alpha d/m/ml/ppm turbidity, Alpha program, L-area Problems, Removal of alumina from the reactor complex, and Comparison of fuel cycles. (GHH)

620 (DPSP–75-1219) **Mark 60B blanket tube failure.** Carlson, M.K. Du Pont de Nemours (E.I.) and Co., Aiken, SC (United States). Savannah River Plant. 1 Aug 1975. 32p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-76SR00001 ;AC09-89SR18035. Order Number DE93001355. Source: OSTI; NTIS; GPO Dep.

A Mark 60B Li-Al target element jammed during discharge from 105-K reactor on March 17, 1975. This failure is described. Fragments from it were analyzed to determine the most probable failure mechanism: The failed target element was single extruded. When a piece of Li-rich dross fell into the mold during casting, it remained intact until coextrusion, when it penetrated or greatly thinned the cladding. The inclusion reacted with moderator during irradiation to corrode the target element and cause swelling, which ultimately caused jamming. All targets should be double extruded. (DLC)

621 (DPW–5408) **Project 8980: Savannah River Plant, Building 105, reactor tank design.** Bellas, H.W. Du Pont de Nemours (E.I.) and Co., Wilmington, DE (United States). Explosives Dept. 19 May 1952. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-76SR00001. (SR/H–223). Order Number DE93001456. Source: OSTI; NTIS (US Sales Only); GPO Dep.

The design of the tank structure of the Savannah River reactors has been under scrutiny from the standpoint of thermal stresses in the tank walls and joints. These stresses result from restraint of differential expansion of various wall sections that are in contact with different temperatures of liquids and varying amounts of radiation. For example, the bottom plate of the tank is heated from above by radiation effects and by effluent from fuel tubes and cooled from below by water in the bottom shield, while the side wall to which the bottom is welded may be washed by cool effluent from blanket tubes mixing with warm moderator. Since the resulting temperatures in the bottom plate and side wall can differ widely even in normal operation, the question has arisen as to what stresses are imposed on the weld and the plates adjoining. The major problems of interest are: (1) Bottom joint (between side wall and top to bottom shield). (a) Adequate design of joint - originally conceived as a right- angle double fillet weld. (b) Thermal stresses in and near joint - obtaining in normal operating conditions with various types of loading, and also transients in scrams, etc. (2) Top, expansion joint (between side wall and bearing ring of upper tank). (a) Thermal stresses in and near joint.

622 (DPW–5412) **Radiation from empty reactor.** Arnett, L.M. Du Pont de Nemours (E.I.) and Co., Wilmington, DE (United States). Explosives Dept. 15 May 1952. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-76SR00001. (SR/H–226). Order Number DE93001459. Source: OSTI; NTIS (US Sales Only); GPO Dep.

When one of the tubes through the bottom or top shield is opened and the inside of the empty reactor exposed, gamma radiation from three principal sources will escape. This report discusses the escape of radiation from and empty reactor.(JL)

623 (DPW–5475) **Trip report - Hanford, May 12–15, 1952.** Chren, W.A. Du Pont de Nemours (E.I.) and Co., Wilmington, DE (United States). Explosives Dept. 26 May 1952. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-76SR00001. (SR/H–231). Order Number DE93001905. Source: OSTI; NTIS (US Sales Only); GPO Dep.

This report summarizes a trip to the Hanford plant to obtain information concerning slug failures and related problems. The trip was on May 12–15, 1952. (JL)

624 (DPW–5490) **Trip report - Hanford Works.** Judkins, E.H. Du Pont de Nemours (E.I.) and Co., Wilmington, DE (United States). Explosives Dept. 27 May 1952. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-76SR00001. (SR/H–234). Order Number DE93001911. Source: OSTI; NTIS (US Sales Only); GPO Dep.

This trip report discusses a visit to reacquaint the writer with Hanford equipment and practice. Also studied were slug rupture problems and contamination problems. The report is dated May 27, 1952. (JL)

625 (DPW–5601) **Corrosion testing program at Argonne National Laboratory.** Worthington, H. Du Pont de Nemours (E.I.) and Co., Wilmington, DE (United States). Explosives Dept. 6 Jun 1952. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-76SR00001. (SR/H–198). Order Number DE93000659. Source: OSTI; NTIS (US Sales Only); GPO Dep.

An outline is given of a corrosion testing program to find a uranium alloy with a corrosion resistance to water at 100 C about 1000 times as great as that of natural U. The material would be acceptable as a reactor fuel material (the cladding would be thinner than the present fuel slug). (DLC)

626 (DPW–5666) **Trip report: [Standard pile design].** Doeringsfeld, K.H. Du Pont de Nemours (E.I.) and Co., Wilmington, DE (United States). Explosives Dept. 4 Jun 1952. 9p. Sponsored

by USDOE, Washington, DC (United States). DOE Contract AC09-76SR00001. (SR/H–200). Order Number DE93000661. Source: OSTI; NTIS (US Sales Only); GPO Dep.

This memorandum discusses a meeting held at the General Engineering Laboratories of General Electric on May 26, 1952, to discuss the status of the Standard Pile design. The memo is dated June 4, 1952.

627 (DPW–5715) **Trip report, Hanford, May 19–22, 1952: [Irrodiction results; uranium canning].** Dunnington, B.W. Du Pont de Nemours (E.I.) and Co., Wilmington, DE (United States). Explosives Dept. 26 Jun 1952. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-76SR00001. (SR/H–203). Order Number DE93000664. Source: OSTI; NTIS (US Sales Only); GPO Dep.

Attempts to reduce the number of failures have resulted in the formulation of a number of plans for investigation, and a large increase in the technical staff assigned to work on reactor materials. This report discusses a visit to the Hanford Reservation in May, 1952 to review programs concerning the canning of uranium. (JL)

628 (HW–7-3486) **Production Test No. 305-9-P, poisoning effectiveness and uniformity of myrnalloy slugs.** Wende, C.W.J. Du Pont de Nemours (E.I.) and Co., Richland, WA (United States). 19 Feb 1946. 3p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE93001233. Source: OSTI; NTIS (US Sales Only); GPO Dep.

The objective of this report is to determine the poisoning effectiveness and uniformity of a batch of approximately thirty myrnalloy slugs prior to charging into the B pile. The report is dated February 19, 1946. (JL)

629 (HW–11374) **History of the reactivation of 100-B pile.** Filip, E.J. Hanford Works, Richland, WA (United States). 29 Oct 1948. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE93000330. Source: OSTI; NTIS (US Sales Only); GPO Dep.

This report summarizes the preparations made for reactivation of the 100-B pile and the operational activities associated with the reactivation and subsequent operation up to the time of reaching desired power level. The period covered is from approximately June 1, 1948 until July 16, 1948.

630 (HW–20250) **New reactor area.** Gross, C.N. Hanford Works, Richland, WA (United States). 29 Jan 1951. 2p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE93002065. Source: OSTI; NTIS (US Sales Only); GPO Dep.

This memorandum discusses discusses the design of a new reactor area in relation to the H pile.

631 (HW–21761) **Report on additional production capacity of Hanford Works meeting to fix water requirements.** Gast, P.F. Hanford Works, Richland, WA (United States). 26 Jul 1951. 2p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE93002070. Source: OSTI; NTIS (US Sales Only); GPO Dep.

This memorandum discusses a meeting held to fix water requirements necessary for additional production capacity.

632 (HW–22109) **Report on additional production capacity of Hanford Works expected life of piles.** McClaine, L.A.; Bupp, L.P. Hanford Works, Richland, WA (United States). 8 Aug 1951. 3p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE93002071. Source: OSTI; NTIS (US Sales Only); GPO Dep.

This memorandum discusses the expected life of the piles with regard to additional production capacity.

633 (HW–22110) **Report on additional production capacity of Hanford Works – Factors Involved In Case II and Case III.** Reinker, P.H. Hanford Works, Richland, WA (United States). 8 Aug 1951. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE93002073. Source: OSTI; NTIS (US Sales Only); GPO Dep.

This memorandum discusses factors involved in the additional production capacity of Hanford Works.

634 (HW–22423) **Development of new methods for removing ruptured slugs.** Warren, J.H. Hanford Works, Richland, WA (United States). 12 Oct 1951. 1p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE93002072. Source: OSTI; NTIS (US Sales Only); GPO Dep.

This memorandum discusses the removal of ruptured slugs utilizing new methodology.

635 (HW–28778) **A program for testing raw Columbia River water as a pile coolant.** Atwood, J.M. Hanford Works, Richland, WA (United States). 21 Jul 1953. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE93000331. Source: OSTI; NTIS (US Sales Only); GPO Dep.

The potentialities of unfiltered Columbia River water as a pile coolant have been discussed in a recent survey of the available information on the subject. The survey report points out the gains which the use of unfiltered water offers, and proposes a logical framework of treatment by chemical additives which appears to have a reasonable probability of successfully developing a far less expensive pile coolant. A comprehensive testing program is now being initiated to obtain the required experimental information concerning the effects of unfiltered water on corrosion, film formation, and effluent activity. The purpose of this report is to outline the range of variables to be studied; to discuss the various experimental techniques to be used; and to establish the anticipated scheduling of the several phases of the program.

636 (HW–29406) **The effects of water quality on pile operation: Production test number 105-525-E.** Miller, N.R. General Electric Co., Richland, WA (United States). Hanford Atomic Products Operation. 21 Sep 1953. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE93000332. Source: OSTI; NTIS (US Sales Only); GPO Dep.

The objective of this test is to evaluate the effects of low pH process water and unfiltered river water on pile operation. This report is dated September 21, 1953.

637 (HW–43938-Del.) **Hanford Atomic Products Operation monthly report, June 1956.** General Electric Co., Richland, WA (United States). Hanford Atomic Products Operation. 23 Jul 1956. 405p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE93000764. Source: OSTI; NTIS (US Sales Only); GPO Dep.

This document presents a summary of work and progress at the Hanford Engineer Works for June 1956. The report is divided into sections by department. A plant wide general summary is included at the beginning of the report, after which the departmental summaries begin. The Manufacturing Department reports plant statistics, and summaries for the Metal Preparation, Reactor and Separation sections. The Engineering Department's section summarizes work for the Technical, Design, and Project Sections. Costs for the various departments are presented in the Financial Department's summary. The Medical, Radiological Sciences, Utilities and General Services, Employee and Public Relations, and Community Real Estate and Services departments have sections presenting their monthly statistics, work, progress, and summaries.

638 (HW–51741-Del.) **Hanford Laboratories Operation monthly activities report, July 1957.** Parker, H.M. General Electric Co., Richland, WA (United States). Hanford Atomic Products Operation. 15 Aug 1957. 133p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE93001330. Source: OSTI; NTIS (US Sales Only); GPO Dep.

This document presents a summary of work and progress at the Hanford Engineer Works for July, 1957. The report is divided into sections by department. A plant wide general summary is included at the beginning of the report, after which the departmental summaries begin. The manufacturing Department reports plant statistics, and summaries for the Metal Preparation, Reactor and separation sections. The Engineering Department's section summarizes work for the Technical, Design, and Project sections. Costs for the various departments are presented in the Financial Department's summary. The Medical, Radiological Sciences, Utilities and

General Services, Employee and Public Relations, and Community Real Estate and Services Departments have sections presenting their monthly statistics, work, progress, and summaries.

639 (HW–52809-Del.) **Irradiation Processing Department monthly record report, September 1957.** General Electric Co., Richland, WA (United States). Hanford Atomic Products Operation. 21 Oct 1957. 143p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE92040140. Source: OSTI; NTIS (US Sales Only); GPO Dep.

This report details activities of the irradiation department during the month of September, 1957. The report is divided into the following sections: Research and Engineering operations; Production and Reactor Operations; Facilities Engineering Operations; Employee Relations Operations; and Financial Operation.

640 (HW–54689-Del.) **Irradiation Processing Department, monthly record report, January 1958.** Greninger, A.B. General Electric Co., Richland, WA (United States). Hanford Atomic Products Operation. 21 Feb 1958. 145p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE93000999. Source: OSTI; NTIS (US Sales Only); GPO Dep.

This document details activities of the irradiation processing department during the month of January, 1958. A general summary is included at the start of the report, after which the report is divided into the following sections: Research and Engineering Operations; Production and Reactor Operations; Facilities Engineering Operation; Employee Relations Operation; and Financial Operation.

641 (HW–54760-Del.) **Hanford Laboratories Operation, monthly activities report, January 1958.** Parker, H.M. General Electric Co., Richland, WA (United States). Hanford Atomic Products Operation. 15 Feb 1958. 164p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE93000767. Source: OSTI; NTIS (US Sales Only); GPO Dep.

This document presents a summary of work and progress at the Hanford Engineer Works for January, 1958. The report is divided into sections by department. A plant wide general summary is included at the beginning of the report, after which the departmental summaries begin. The manufacturing Department reports plant statistics, and summaries for the Metal Preparation, Reactor and separation sections. The Engineering Department's section summarizes work for the Technical, Design, and Project sections. Costs for the various departments are presented in the Financial Department's summary. The Medical, Radiological Sciences, Utilities and General Services, Employee and Public Relations, and Community Real Estate and Services Departments have sections presenting their monthly statistics, work, progress, and summaries.

642 (HW–55462) **Irradiation Processing Department monthly record report, March 1958.** Greninger, A.B. Hanford Works, Richland, WA (United States). 21 Apr 1958. 145p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE93001249. Source: OSTI; NTIS (US Sales Only); GPO Dep.

This document details activities of the irradiation processing department during the month of March, 1958. A general summary is included at the start of the report, after which the report is divided into the following sections: Research and Engineering Operations; Production and Reactor Operations; Facilities Engineering Operation; Employee Relations Operation; and Financial Operation.

643 (HW–55870-Del.) **Irradiation Processing Department, monthly record report, April 1958.** Greninger, A.B. Hanford Works, Richland, WA (United States). 21 May 1958. 151p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE93001000. Source: OSTI; NTIS (US Sales Only); GPO Dep.

This document details activities of the irradiation processing department during the month of April, 1958. A general summary is included at the start of the report, after which the report is divided into the following sections: Research and Engineering Operations; Production and Reactor Operations; Facilities Engineering Operation; Employee Relations Operation; and Financial Operation.

644 (HW–59840-Del.) **Irradiation Processing Department monthly record report, March 1959.** Greninger, A.B. Hanford Works, Richland, WA (United States). 21 Apr 1959. 142p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE93001250. Source: OSTI; NTIS (US Sales Only); GPO Dep.

This document details activities of the irradiation processing department during the month of March, 1959. A general summary is included at the start of the report, after which the report is divided into the following sections: Research and Engineering Operations; Production and Reactor Operations; Facilities Engineering Operation; Employee Relations Operation; and Financial Operation.

Hanford Atomic Products Operation. 15 May 1962. 219p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE93001230. Source: OSTI; NTIS (US Sales Only); GPO Dep.

This document presents a summary of work and progress at the Hanford Engineer Works for April, 1962. The report is divided into sections by department. A plant wide general summary is included at the beginning of the report, after which the departmental summaries begin. The manufacturing Department reports plant statistics, and summaries for the Metal Preparation, Reactor and separation sections. The Engineering Department's section summarizes work for the Technical, Design, and Project sections. Costs for the various departments are presented in the Financial Department's summary. The Medical, Radiological Sciences, Utilities and General Services, Employee and Public Relations, and Community Real Estate and Services Departments have sections presenting their monthly statistics, work, progress, and summaries.

667 (HW–73532) **Fuels Preparation Department monthly report, April 1962.** Dickeman, R.L. General Electric Co., Richland, WA (United States). Hanford Atomic Products Operation. 7 May 1962. 56p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE93000988. Source: OSTI; NTIS (US Sales Only); GPO Dep.

This report is divided into manufacturing (AlSi process, coextrusion) and engineering (present reactor fuels, new canning processes, N Reactor fuels).

672 (HW–75099) **Fuels Preparation Department monthly report, September 1962.** Dickeman, R.L. General Electric Co., Richland, WA (United States). Hanford Atomic Products Operation. 8 Oct 1962. 53p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE93000989. Source: OSTI; NTIS (US Sales Only); GPO Dep.

This document details activities of the Fuels Preparation Department during the month of September 1962. (FI)

673 (HW–75683) **Fuels Preparation Department monthly report, November 1962.** General Electric Co., Richland, WA (United States). Hanford Atomic Products Operation. 7 Dec 1962. 71p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE93000876. Source: OSTI; NTIS (US Sales Only); GPO Dep.

This document details activities of the Fuels Preparation Department during the month of November 1962.

674 (IGC–124) **Analysis of selected fast critical assemblies using JENDL-2 based unadjusted multigroup data.** Devan, K.; Gopalkrishnan, V.; Ramanadhan, M.M.; Lee, S.M. Indira Gandhi Centre for Atomic Research, Kalpakkam (India). 1991. 41p. Order Number DE93605831. Source: OSTI; NTIS (US Sales Only); INIS.

In order to validate the non-adjusted multigroup cross section set recently prepared from the Japanese Evaluated Nuclear Data Library - Version 2 (JENDL-2), some of the integral parameters of several fast critical benchmark reactor assemblies were analysed by comparing the measured values with those predictions using this cross section set and also by intercomparing the values predicted by various cross section sets. The observations of analyses are presented in this report. The benchmark assemblies have been chosen such that there is a variety in core size, majorfuel component, reflector used etc. One dimensional homogeneous diffusion theory model was used and suitable corrections were added. The assemblies considered were among the ones recommended by the Cross Section Evaluation Working Group (CSEWG), viz. ZPR-3-12, ZPR-3-48, ZPR-3-49, ZPR-3-50, ZPR-3-53, ZPR-3-54, ZPR-3-56B, ZPR-6-7 and ZPR-6-6A. (author). 10 refs., 25 tabs.

Joint Inst. for Nuclear Research, Dubna (Russian Federation). Lab. of Neutron Physics. 1990. 11p. Order Number DE93605832. Source: OSTI; NTIS (US Sales Only); INIS.

Submitted to Ann. Nucl. Energy.

The system to monitor abnormal conditions in a nuclear reactor, based on the noise analysis of the reactor basic parameters such as power, temperature and coolant flow rate, has been developed. The pattern recognition techniques such as clustering, cluster analysis, feature selection and clusters visualization methods form the basis of the software. Apart from non-hierarchical clustering procedures applied earlier, the hierarchical one is recommended. The system application for IBR-2 Dubna reactor diagnostics is shown. 10 refs.; 6 figs.

703 (KAERI/RR–1017/90) **The development of silicon doping technique by neutron transmutation.** Kim, Huhn Jun (Korea Atomic Energy Research Inst., Daeduk (Korea, Republic of)); Kim, Yong Che; Chun, Byung Chil; Lee, Chang Hee; Lee, Jeong Soo; Seong, Baek Seok; Shim, Hae Seop; Choi, Byoung Hoon; Ho, Jong Wha. This project is the 3rd year research which develops the neutron transmutation doping techniques for the large diameter Si ingot (max. 150mm, target resistivity ±5%) at the KMRR irradiation sleeve sites. Contents of this year research are design of the irradiation sleeve design and making of irradiation facility, and measurements of absolute neutron flux distribution. 1D-ANISN result, which was developed for design of irradiation sleeve on the fixed position method, was revised by 2D-VENTURE code calculation, and variations of flux distribution due to Si ingot insertion and effects of Al filler addition were studied. Study is in progress for optimized screen design according to the flux variation during the KMRR fuel cycle and evaluation of its uniformity. First prototype of semi-automatic irradiation facility was designed and fabricated, and is under test. Overall precision satisfies design goals, and improvements are under way for emergency state and their safety operations. Precise fast neutron measurements and its integrated spectrum were developed, and design of foil detector kits and working manual for the measurement are being prepared. (Author).

704 (WSRC-RP–91-0952) **Scoping tests on the potential for lithium/aluminum steam explosions in an SRS Septifoil: Severe Accident Program.** Cho, D.H. (Argonne National Lab., IL (United States)); Gabor, J.D.; Purviance, R.T.; Cassulo, J.C.; Ellison, P.G.; Hyder, M.L. Westinghouse Savannah River Co., Aiken, SC (United States); Argonne National Lab., IL (United States). Sep 1991. 25p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. Order Number DE92040819. Source: OSTI; NTIS; GPO Dep.

In May 1991, WSRC/SRL requested that ANL conduct five scoping tests in order to investigate the potential for self-triggered lithium/aluminum steam explosion in an SRS Septifoil. This work was to support the ongoing SAR Chapter 15 analysis for the K-reactor restart at SRS. The five tests were successfully completed over a two-month period between June and August 1991. The conditions for the five tests were specified by the WSRC designated technical manager, Dr. Phillip G. Ellison. While the tests were carried out in an existing facility at ANL, WSRC/SRL provided the test sections which consisted of a three-foot long SRS Septifoil section including webbing, bottom endfitting, and eleven-inch long control rod segments. In addition, WSRC/SRL supplied the lithium/aluminum alloy required for the tests.

705 (ANL/CP–76320) **Experimental and design experience with passive safety features of liquid metal reactors.** Lucoff, D.M. (Westinghouse Hanford Co., Richland, WA (United States)); Waltar, A.E.; Sackett, J.I.; Salvatores, M.; Aizawa, K. Argonne National Lab., Idaho Falls, ID (United States). Oct 1992. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-921003–9: International conference on design and safety of advanced nuclear power plants, Tokyo (Japan), 25-28 Oct 1992). Order Number DE92041097. Source: OSTI; NTIS; INIS; GPO Dep.

Liquid metal cooled reactors (LMRs) have already been demonstrated to be robust machines. Many reactor designers now believe that it is possible to include in this technology sufficient passive safety that LMRs would be able to survive loss of flow, loss of heat sink, and transient overpower events, even if the plant protective system fails completely and do so without damage to the core. Early whole-core testing in Rapsodie, EBR-II. and FFTF indicate such designs may be possible. The operational safety testing program in EBR-II is demonstrating benign response of the reactor to a full range of controls failures. But additional testing is needed if transient core structural response under major accident conditions is to be properly understood. The proposed international Phase IIB passive safety tests in FFTF, being designed with a particular emphasis on providing, data to understand core bowing extremes, and further tests planned in EBR-11 with processed IFR fuel should provide a substantial and unique database for validating the computer codes being used to simulate postulated accident conditions.

A meeting was held on May 13, 1952 to review problems associated with the accidental dropping of a control rod into the reactor.(JL)

708 (EGG-TMI–7757) **TMI-2 upper-core particle bed thermal behavior.** Kuan, P. EG and G Idaho, Inc., Idaho Falls, ID (United States). Aug 1987. 60p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-76ID01570. Order Number DE92040953. Source: OSTI; NTIS; INIS; GPO Dep.

Models of dryout heat fluxes of particle beds believed to be applicable to the TMI-2 upper-core particle bed are reviewed and developed. A simplified Lipinski model and a model based on flooding are shown to agree between themselves and with experiments. These models are applied to the calculation of the dryout heat flux of the TMI-2 upper-core particle bed. The TMI-2 upper-core particle bed is shown to be: (a) coolable, if little heat is transferred to it from the consolidated region below, (b) only marginally coolable, if not uncoolable, before material relocation from the consolidated region, if most of the heat in the consolidiated region is transferred to it, and (c) coolable, after the relocation, regardless of heat transfer from the remaining consolidated region. Based on an analogy to quenching experiments, which show that the heat flux during the quench of a particle bed is approximately equal to the dryout heat flux, the time required to quench the TMI-2 upper-core particle bed from 2000 K to the saturation temperature of water during the accident is estimated. The bed was either quenched by 225 min after the initiation of the accident (assuming no heat was transferred to it from the consolidated region) or, at the latest, by 245 min (20 min after molten material relocation to the lower plenum from the consolidated region; assuming most of the heat generated in the consolidated region, both before and after the relocation, was transferred to the particle bed).

709 (HW–25742) **Recommended settings for 105-C trips.** Roy, G.M. Hanford Works, Richland, WA (United States). 25 Sep 1952. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE93002078. Source: OSTI; NTIS (US Sales Only); GPO Dep.

This memorandum discusses the engineered safety system which combines the Ball 3-X System with the VSR System. The operation of the system is detailed and settings are recommended for 105-C trips.

A Third Party inspection of the reactor work platforms was conducted by representatives of the Travelers Insurance Company in 1958. An inspection report submitted by these representatives described hazardous conditions noted and presented a series of recommendations to improve the operational safety of the systems. Project CGI-960, "C" & "D" Work Platform Safety Improvements – All Reactors, vas initiated to modify the platforms in compliance with the Third Party recommendations. The American Standard Safety Code for Elevators Dumbwaiters and Escalators (A-17.1) is used as a guide by the Third Party in formulating their recommendations. This code is used because there is no other applicable code for this type of equipment. While the work platforms do not and in some cases can not comply with this code because of operational use, every effort is made to comply with the intent of the code.

716 (KAERI/RR–1068/91) **TRIGA mark-II,III reactor safety re-evaluation.** Jun, B. J. (Korea Atomic Energy Research Inst., Daeduk (Korea, Republic of)); Park, S. J.; Hong, K. P.; Lee, J. P.; Oh, S. Y.; Kim, Y. J.; Kim, J. K.; Kang, T. J.; Youm, G. H.; Song, G. Y. Korea Atomic Energy Research Inst., Daeduk (Korea, Republic of). Jan 1991. 41p. (In Korean). Order Number DE93605591. Source: OSTI; NTIS (US Sales Only); INIS.

For two years of 1990 and 1991, the safety of TRIGA Mk-II and III reactor has been re-evaluated. For this, domestic rules on research reactors has been reviewed, and as it was judged that standards on research reactors in USA is applicable to our ones it was evaluated whether TRIGA Mk-II and III reactors satisfy these standards. The site parameters and the environmental impacts during normal operation and hypothetical accident conditions have been analysed, and those parts for reactor facility and structure have been rewritten to fit SAR standard format based on the review of old SAR and maintenance manuals reflecting changes after the construction. Based on this re-evaluation, SAR, Technical

Specifications, Radiation Emergency Plan, Environment Report, various procedures,etc. will be amended by the reactor management project. (Author).

717 (NUREG/CP–0122-Vol.1) **Proceedings of the Aging Research Information Conference: Volume 1.** Beranek, A. (comp.). Nuclear Regulatory Commission, Washington, DC (United States). Sep 1992. 556p. Sponsored by Nuclear Regulatory Commission, Washington, DC (United States). (CONF-920375–Vol.1: Aging research information conference, Rockville, MD (United States), 24-27 Mar 1992). Source: OSTI; NTIS; INIS; GPO.

This report presents the proceedings of the Aging Research Information Conference held at the Holiday Inn Crowne Plaza in Rockville, Maryland, on March 24–27, 1992. This conference was held to disseminate research results in the area of nuclear power plant aging from programs sponsored by the Office of Nuclear Regulatory Research, US Nuclear Regulatory Commission. The papers and talks appear in the order in which they were presented at the conference, and they are grouped by technical session in two volumes. This document, Volume 1 contains the proceedings of March 24 and 25, while Volume 2 contains the proceedings of March 26 and 27.

718 (NUREG/CR–4674-Vol.15) **Precursors to potential severe core damage applications, 1991: A status report, main report and Appendix A.** Minarick, J.W. (Science Applications International Corp., Oak Ridge, TN (United States)); Dolan, B.W.; Cletcher, J.W.; Copinger, D.A. Nuclear Regulatory Commission, Washington, DC (United States). Div. of Safety Programs; Oak Ridge National Lab., TN (United States). Sep 1992. 153p. Sponsored by Nuclear Regulatory Commission, Washington, DC (United States). DOE Contract AC05-84OR21400. (ORNL/NOAC–232-Vol.15). Source: OSTI; NTIS; INIS; GPO.

Twenty-seven operational events with conditional probabilities of subsequent severe core damage of 1.0 x 10-6 or higher occurring at commercial light-water reactors during 1991 are considered to be precursors to potential severe core damage. These are described along with associated significance estimates, categorization, and subsequent analyses. This study is a continuation of earlier work, which evaluated 1969-1981 and 1984-1990 events. The report discusses (1) the general rationale for this study, (2) the selection and documentation of events as precursors, (3) the estimation and use of conditional probabilities of subsequent severe core damage to mnk precursor events, and (4) the plant models used in the analysis process.

719 (NUREG/CR–5787-Vol.1) **Timing analysis of PWR fuel pin failures: Volume 1, Main text and Appendices A–J: Final report.** Jones, K.R. (EG and G Idaho, Inc., Idaho Falls, ID (United States)); Wade, N.L.; Katsma, K.R.; Siefken, L.J.; Straka, M. Nuclear Regulatory Commission, Washington, DC (United States). Div. of Safety Issue Resolution; EG and G Idaho, Inc., Idaho Falls, ID (United States). Sep 1992. 349p. Sponsored by Nuclear Regulatory Commission, Washington, DC (United States). DOE Contract AC07-76ID01570. (EGG–2657-Vol.1). Source: OSTI; NTIS; INIS; GPO.

Research has been conducted to develop and demonstrate a methodology for calculation of the time interval between receipt of the containment isolation signals and the first fuel pin failure for loss-of-coolant accidents (LOCAs). Demonstration calculations were performed for a Babcock and Wilcox (B&W) design (Oconee) and a Westinghouse (W) four-loop design (Seabrook). Sensitivity studies were performed to assess the impacts of fuel pin burnup, axial peaking factor, break size, emergency core cooling system availability, and main coolant pump trip on these times. The analysis was performed using the following codes: FRAPCON-2, for the calculation of steady-state fuel behavior; SCDAP/RELAP5/MOD3 and TRACPF1/MOD1, for the calculation of the transient thermal-hydraulic conditions in the reactor system; and FRAP-T6, for the calculation of transient fuel behavior. In addition to the calculation of fuel pin failure timing, this analysis provides a comparison of the predicted results of SCDAP/RELAP5/MOD3 and TRAC-PFL/MOD1 for large-break LOCA analysis. Using SCDAP/RELAP5/MOD3 thermal-hydraulic data, the shortest time intervals calculated between initiation of containment isolation and fuel pin failure are 10.4 seconds and 19.1 seconds for the B&W and W plants, respectively. Using data generated by TRAC-PF1/MOD1, the shortest intervals are 10.3 seconds and 29.1 seconds for the B&W and W plants, respectively. These intervals are for a double-ended, offset-shear, cold leg break, using the technical specification maximum peaking factor and applied to fuel with maximum design burnup. Using peaking factors commensurate widi actual burnups would result in longer intervals for both reactor designs. This document also contains appendices A through J of this report.

720 (NUREG/CR–5787-Vol.2) **Timing analysis of PWR fuel pin failures: Volume 2, Appendices K–L: Final report.** Jones, K.R. These intervals are for a double-ended, offset-shear, cold leg break, using the technical specification maximum peaking factor and applied to fuel with maximum design burnup. Using peaking factors commensurate with actual burnups would result in longer intervals for both reactor designs. This document provides appendices K and L of this report which provide plots for the timing analysis of PWR fuel pin failures for Oconee and Seabrook respectively.

721 (NUREG/CR–5910) **Loss of essential service water in LWRs (GI-153): Scoping study.** Cramond, W.R. (Sandia National Labs., Albuquerque, NM (United States)); Mitchell, D.B.; Yakle, J.L.; Miller, S.P. Nuclear Regulatory Commission, Washington, DC (United States). Div. of Safety Issue Resolution; Sandia National Labs., Albuquerque, NM (United States). Aug 1992. 361p. Sponsored by Nuclear Regulatory Commission, Washington, DC (United States). DOE Contract AC04-76DP00789. (SAND–92-1084). Source: OSTI; NTIS; INIS; GPO.

The contribution of essential service water (ESW) system failure to core damage frequency has long been a concern of the NRC. The objective of this study is to assess the safety significance of the loss of ESW systems in LWRs relative to core damage frequency (CDF) and perform a limited value/impact analysis of potential modifications to solve ESW vulnerabilities using a prototypical (pilot) plant. Previous studies indicate that service water systems contribute from < 1% to 65% of the total internal CDF. For the pilot plant analyzed, common ESW vulnerabilities are failure of standby service water pumps to start, backflow through check valves for cross-tied pumps, and failure of normally closed isolation valves in diesel generator cooling loops to open on demand. For the potential modifications evaluated for the pilot plant, the results showed that they could reduce the CDF by as much as 33 percent. However, the dollars per person REM measures resulting from various groups of these modifications significantly exceeded the

current criteria of $1000. The results, since they only apply to the prot plant, are not typical of all LWRs. Due to the importance of service water to CDF and the plant specific nature of ESW systems, there could be plants for which there would be cost-effective modifications. Additional analysis would be required to identify them.

722 (NUREG/CR–5930) **High integrity software standards and guidelines.** Wallace, D.R. (National Inst. of Standards and Technology, Gaithersburg, MD (United States)); Ippolito, L.M.; Kuhn, D.R. Nuclear Regulatory Commission, Washington, DC (United States). Div. of Systems Research; National Inst. of Standards and Technology, Gaithersburg, MD (United States). Sep 1992. 103p. Sponsored by Nuclear Regulatory Commission, Washington, DC (United States). (NIST/SP–500-204). Source: OSTI; NTIS; INIS; GPO.

This report presents results of a study of standards, draft standards, and guidelines (all of which will hereafter be referred to as documents) that provide requirements for the assurance of software in safety systems in nuclear power plants. The study focused on identifying the attributes necessary in a standard for providing reasonable assurance for software in nuclear systems. The study addressed some issues involved in demonstrating conformance to a standard The documents vary widely in their requirements and the precision with which the requirements are expressed. Recommendations are provided for guidance addressing the assurance of high integrity software. It is recommended that a nuclear industry standard be developed based on the documents reviewed in this study with additional attention to the concerns identified in this report.

723 (ORNL/NSP–92/1) **Status of conversion of DOE standards to non-Government standards.** Moseley, H.L. Oak Ridge National Lab., TN (United States). Jul 1992. 18p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE93000546. Source: OSTI; NTIS; GPO Dep.

One major goal of the DOE Technical Standards Program is to convert existing DOE standards into non-Government standards (NGS's) where possible. This means that a DOE standard may form the basis for a standards-writing committee to produce a standard in the same subject area using the non-Government standards consensus process. This report is a summary of the activities that have evolved to effect conversion of DOE standards to NGSs, and the status of current conversion activities. In some cases, all requirements in a DOE standard will not be incorporated into the published non-Government standard because these requirements may be considered too restrictive or too specific for broader application by private industry. If requirements in a DOE standard are not incorporated in a non-Government standard and the requirements are considered necessary for DOE program applications, the DOE standard will be revised and issued as a supplement to the non-Government standard. Tne DOE standard will contain only those necessary requirements not reflected by the non-Government standard. Therefore, while complete conversion of DOE standards may not always be realized, the Department's technical standards policy as stated in Order 1300.2A has been fully supported in attempting to make maximum use of the non-Government standard.

724 (PNL-SA–18921) **ASME development of risk-based inspection guidelines for nuclear power plants.** Gore, B.F.; Balkey, K.R. Pacific Northwest Lab., Richland, WA (United States). Aug 1992. 8p. Sponsored by USDOE, Washington, DC (United States); Nuclear Regulatory Commission, Washington, DC (United States). DOE Contract AC06-76RL01830. (CONF-9208103–2: INTER-RAMQ conference for electric power industry, Philadelphia, PA (United States), 25-28 Aug 1992). Order Number DE93001311. Source: OSTI; NTIS; INIS; GPO Dep.

A methodology has been developed for use in preparing guidelines for the in-service inspection of nuclear power plant pressure boundary and structural components. This methodology is a further development of a general methodology previously published by the task force for application to any industry. It is unique in that it utilizes probabilistic risk assessment (PRA) information to improve the quantification of risks associated with component ruptures. A procedure has also been recommended for using the resulting quantified risk estimates to determine target component rupture probability values to be maintained by inspection activities. Characteristics which an inspection strategy must possess in order to maintain target rupture probabilities are being determined by structural risk and reliability analysis (SRRA) calculations. The major features of this methodology are described in this paper, and example applications are briefly discussed. Plans for additional work in developing and applying the methodology are described.

725 (SAND–92-1241) **Results of an experiment in a Zion-like geometry to investigate the effect of water on the containment basement floor on direct containment heating (DCH) in the Surtsey Test Facility: The IET-4 test.** Allen, M.D. (Sandia National Labs., Albuquerque, NM (United States)); Blanchat, T.K.; Pilch, M.; Nichols, R.T. Sandia National Labs., Albuquerque, NM (United States). Sep 1992. 76p. Sponsored by Nuclear Regulatory Commission, Washington, DC (United States). DOE Contract AC04-76DP00789. Order Number DE93002514. Source: OSTI; NTIS; INIS; GPO Dep.

This document discusses the fourth experiment of the Integral Effects Test (IET-4) series which was conducted to investigate the effects of high pressure melt ejection on direct containment heating. Scale models (1:10) of the Zion reactor pressure vessel (RPV), cavity, instrument tunnel, and subcompartment structures were constructed in the Surtsey Test Facility at Sandia National Laboratories. ne RPV was modeled with a melt generator that consisted of a steel pressure barrier, a cast MgO crucible, and a thin steel inner liner. The melt generator/crucible had a hemispherical bottom head containing a graphite limitor plate with a 3.5-cm exit hole to simulate the ablated hole in the RPV bottom head that would be tonned by tube ejection in a severe nuclear power plant accident. The reactor cavity model contained 3.48 kg of water with a depth of 0.9 cm that corresponded to condensate levels in the Zion plant. A 43-kg initial charge of iron oxide/aluminum/chromium thermite was used to simulate corium debris on the bottom head of the RPV. Molten thermite was ejected into the scaled reactor cavity by 6.7 MPa steam. IET-4 replicated the third experiment in the IET series (IET-3), except the Surtsey vessel contained slightly more preexisting oxygen (9.6 mol.% vs. 9.0 mol.%), and water was placed on the basement floor inside the crane wall. The cavity pressure measurements showed that a small steam explosion occurred in the cavity at about the same time as the steam explosion in IET-1. The oxygen in the Surtsey vessel in IET-4 resulted in a vigorous hydrogen bum, which caused a significant increase in the peak pressure, 262 kPa compared to 98 kPa in the IET-1 test. EET-3, with similar pre-existing oxygen concentrations, also had a large peak pressure of 246 kPa.

726 (SAND–92-2026C) **Phenomenological direct containment heating models in CONTAIN and their assessment against experimental data.** Washington, K.E.; Griffith, R.O. Sandia National Labs., Albuquerque, NM (United States). [1992]. 3p. Sponsored by Nuclear Regulatory Commission, Washington, DC (United States). DOE Contract AC04-76DP00789. (CONF-921007–1: 20. water reactor safety information meeting, Bethesda, MD (United States), 21-23 Oct 1992). Order Number DE92041154. Source: OSTI; NTIS; INIS; GPO Dep.

In previous years, a suite of interim models had been developed for the CONTAIN code for analyzing direct containment heating (DCH) accidents. The initial development and application of these DCH models are described in a previous WRS paper. While useful, these interim models were incomplete and were highly parametric. The parametric nature of the interim CONTAIN DCH models was necessary at the time because of the lack of relevant DCH experimental data, and to facilitate sensitivity studies aimed at improving our understanding of the most important governing processes in a DCH event. However, today our understanding of DCH phenomenology is significantly improved from when the interim DCH models were developed. This understanding largely stems from recently completed NRC-sponsored DCH experiments at Sandia National Laboratories and Argonne National Laboratory. New models have been developed and added to the CONTAIN code for modeling DCH events to reflect this improvement in our understanding of DCH. The purpose of this paper is to describe the new DCH models in CONTAIN. A demonstration of the new models by comparing simplified calculations against relevant DCH test data

will also be presented in this paper. This paper is an extension of the preliminary descriptions of the DCH model improvements presented in the 19th WRS paper. The new models that have been added to CONTAIN for analyzing DCH are briefly discussed below. The following paragraphs also include brief discussions of the motivation and/or basis for the developed improvement. The models are described in greater detail in the full paper.

728 (CONF-920944–2) **Potential impact of superconductivity on power quality enhancement.** McConnell, B.W. Oak Ridge National Lab., TN (United States). [1992]. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From 6. annual New York State Institute on Superconductivity (NYSIS) conference on superconductivity and applications; Buffalo, NY (United States); 15-17 Sep 1992. Order Number DE93000450. Source: OSTI; NTIS; GPO Dep.

Electric power quality problems are estimated to cost US industry $26 billion dollars per year in lost production. This paper provides a summary of the problem's magnitude, an overview of the underlying causes, discusses the present methods used by industry to reduce the problem's impact and the associated cost, and examines the potential for superconducting technology to effect alternative solutions. The present market for uninterruptible power supplies (UPS) and power conditioners is also discussed and the benefits of applying high temperature superconductors (HTS) are summarized.

729 (ETDE-IT–92-82) **Materials performances in composite insulators during aging.** Sandrolini, F.; Motori, A.; Marrone, G.; Fini, G.P. Ente Nazionale per l'Energia Elettrica, Milan (Italy). Centro di Ricerca Elettrica; Bologna Univ. (Italy). 1991. 16p. Order Number DE93729443. Source: OSTI; NTIS (US Sales Only).

The evaluation of the aging of organic materials for HV electrical insulation under service and laboratory stresses has been carried out by the authors for a long time. The effects of different aging conditions on significant chemical-physical and electrical properties, as well as, on the microstructure of insulating materials for HV components and cables are currently being investigated. In particular, the study of dc and ac electrical behaviour has proved to be very effective in pointing out correlations with the molecular structure (charge carriers, relaxation processes, etc.) of organic materials and changes due to aging. In this paper, the preliminary results concerning the effects of multiple environmental-electrical-mechanical aging on the electrical properties (dc electrical conductivity, ac dielectric constant and loss factor) and microstructure of materials used in HV composite insulators subjected to laboratory and field aging are presented and discussed.

730 (ETDE-IT–92-92) **Review of medium voltage EPR insulated cables used in Italy for public distribution.** Farneti, F.; Gasparini, G. Ente Nazionale per l'Energia Elettrica, Milan (Italy). Centro di Ricerca Elettrica. 1991. 9p. Order Number DE93729459. Source: OSTI; NTIS (US Sales Only).

In Italy, only EPR-extruded insulated cables are to be standardized and used in medium voltage (MV) systems. Standards have been issued by the Italian Electrotechnical Committee and are currently based on those of the International Electrotechnical Committee, at least as far as test methods are concerned. However, ENEL (Italian National Electricity Board) has developed its own manufacturing, operating and test specifications for the following reasons: historically, national standards for EPR-insulated cables were formulated to suit industrial needs (the MV public distribution network, in the past, used only paper-insulated cables); EPR cables are now being introduced into the public network, and it is expected that they will be used consistently. ENEL, in cooperation with cable manufacturers, prepared specifications which took into account the following aspects: differences in underground installation methods; the more critical nature of installation site access; the need to provide the public with high quality service with better-than-industrial failure rate tolerances; and the capability of monitoring changes in the materials or processes used by the manufacturers. These factors have prompted ENEL to revise the Italian cable standardization approach with regard to, not only cable design adequacy, but also to the manufacturer's ability to provide regular supplies and methods to establish cable reliability.

731 (NEI-DK–982) **Dwellings located close to high-voltage systems and the risk of cancer development in children: Background paper.** Olsen, J.H. (Kraeftens Bekaempelses Cancerregister, Copenhagen (DK)); Nielsen, A.; Bautz, A.; Larsen, V.B.; Schulgen, G. Landsforeningen til Kraeftens Bekaempelse, Copenhagen (Denmark). Cancerregisteret. Oct 1992 16p. (In Danish). Order Number DE93721440. Source: OSTI; NTIS.

140 new cases of cancer in children under the age of 14 years are diagnosed each year in Denmark. Of these ca. 45 are leukemia cases. In 1979 two American researchers announced that they had found that cancer risk was greater for children who lived close to high voltage electric cables, within a magnetic field. This finding has later been criticised. The authors's aim was to evaluate the hypotheses that habitation close to high voltage cables and transformers increases the risk of children developing leukemia, brain tumours and cancer in the lymph system, and that the risk of contracting these forms of cancer increases in relation to the strength of the magnetic fields. The investigation was carried out in such a way that it was possible to make adjustments according to social and economic conditions and geographical factors. The groups investigated and the methods used are described and details of the conditions are given. The results of the investigation are presented in the form of statistics and graphs. It is concluded that the risk of cancer in the lymph system is increased amongst children living within the range of magnetic fields (surrounding electric cables) of 0.1 μT or more, which answers to a housing location of 25-50 meters from the most powerful transmission systems. It is pointed out that the investigation encompassed a small number of children. Nationally, it is reckoned that ca. 4000 children are exposed to magnetic fields of at least 0.1 μ T, of which ca. 600 are exposed to 0.4 μT or more in Denmark today. (AB).

2405 Environmental Aspects

732 (DOE/BP–93000392) **Bonneville Power Administration 1991 site environmental report.** USDOE Bonneville Power Administration, Portland, OR (United States). Jun 1992. 35p. Sponsored by USDOE, Washington, DC (United States). Order Number DE93000392. Source: OSTI; NTIS; GPO Dep.

In 1991, in order to provide BPA's management with environmental information for decision making, and to comply with the National Environmental Policy Act (NEPA) of 1969, BPA completed 15 environmental impact evaluations and decision documents, with many more in progress. BPA received the results of two US Department of Energy (DOE) environmental management audits, which noted areas for improvement in our operations. We completed Action Plans in response to each DOE report. We received one administrative complaint from the US Environmental Protection Agency (EPA) concerning a 1990 spill in Arlington, Oregon, caused by a BPA subcontractor. BPA responded promptly to EPA's findings and concerns. There were 32 new spill/release incidents, most involving failure of Polychlorinated biphenyl (PCB) capacitors. Cleanup of these spills/releases has proceeded satisfactorily. BPA continued vigorous efforts to clean up substations contaminated with residuals of oil and PCB from past spills. BPA took several actions to improve our environmental performance with respect to water quality. The BPA environmental team developed a long-term schedule for environmental appraisals and audits, identifying facilities and projects that will receive audits through 1996.

733 (DOE/EA–0737) **Fort Peck-Wolf Point transmission line project, Montana: Final environmental assessment.** USDOE Western Area Power Administration, Billings, MT (United States). Billings Area Office. 1992. 166p. Sponsored by USDOE, Washington, DC (United States). Order Number DE92040951. Source: OSTI; NTIS; INIS; GPO Dep.

The primary objective of the project is to replace the existing 36-mile Fort Peck-Wolf Point transmission line which has reached the end of its useful service life. Presently, the overall condition of this existing section of the 47-year-old line is poor. Frequent repairs have been required because of the absence of overhead ground wires. The continued maintenance of the line will become more expensive and customer interruptions will persist because of the damage due to lightning. The expense of replacing shell rotted poles, and the concern for the safety of the maintenance personnel because of hazards caused by severe shell rot are also of primary importance. The operational and maintenance problems coupled with power system simulation studies, demonstrate the need for improvements to the Wolf Point area to serve area loads. Western's Wolf Point Substation is an important point of interconnection for the power output from the Fort Peck Dam to area loads as far away as Williston, North Dakota. The proposed transmission line replacement would assure that there will continue to be reliable transmission capacity available to serve area electrical loads, as well as provide a reliable second high-voltage transmission path from the Fort Peck generation to back-up a loss of the Fort Peck-Wolf Point 115-kV Line No. 1.

734 (EGG–10617-2129) **Endangered species preactivity survey and monitoring program for Western Area Power Administration's Tracy-Livermore 230-kV transmission line construction: Final report.** EG and G Energy Measurements, Inc., Goleta, CA (United States). Santa Barbara Operations. Jan 1992. 15p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC08-88NV10617. Order Number DE92040480. Source: OSTI; NTIS; GPO Dep.

The Department of Energy (DOE), San Francisco Field Office, requested the establishment of a transmission line between Lawrence Livermore National Laboratory (LLNL) and the Western Area Power Administration (Western) Tracy Substation near Byron, California. Western was responsible for providing this interconnection by designing, constructing, operating, and maintaining the 230-kV transmission line between the Tracy Substation and a new substation at LLNL. The 12.6 mile proposed transmission line route and alternative routes were surveyed in 1986 and 1987. These surveys were used to write a Biological Assessment of the effects of construction and operation of the proposed transmission line on threatened and endangered species and species of concern. On February 1, 1988, Western requested formal consultation with the US Fish and Wildlife Service (FWS) to determine potential impacts of the proposed project on the federally listed endangered San Joaquin kit fox (Vulpes macrotis mutica) and palmate-bracted bird's beak (Cordylanthus palmatus). FWS further required that a report be issued upon project completion which would: detail results; address the adequacy of mitigation and conservation measures; document difficulties encountered in implementing the measures; and recommend improvements in protective measures to be applied towards future projects. This report has been prepared to meet these requirements.

736 (ANL/CP–77105) **Design aspects of mid-size SMES using high temperature superconductors.** Schoenung, S.M. (Schafer (W.J.) Associates, Inc., Livermore, CA); Meier, W.R.; Hull, J.R.; Fagaly, R.L.; Heiberger, M.; Stephens, R.B.; Leuer, J.A.; Guzman, R.A. Argonne National Lab., IL (United States). [1992]. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-920802–6: Applied superconductivity conference, Chicago, IL (United States), 23-28 Aug 1992). Order Number DE92040723. Source: OSTI; NTIS; GPO Dep.

Conceptual designs of modular, cold-supported SMES units using high temperature superconductors (HTS) have been investigated over the mid-size energy range of 2 to 200 MWh (7.2 to 720 GJ). This size range covers many utility, industrial, and military applications. Both toroidal and solenoidal configurations were analyzed to determine physical dimensions, heat loads and cost of major components. Among the effects considered were the impact of critical current density on feasible configurations, mass of conductor, and cost; the effects of magnetic field and strain limits on physical parameters and structural mass; and the savings in refrigeration from operating at high temperature. The design of the HTS conductor, stability criteria, and coolant selection are also discussed.

737 (CONF-920944–3) **Magnetic refrigeration cycle analysis using selected thermodynamic property characterizations for gadolinium gallium garnet.** Murphy, R.W. Oak Ridge National Lab., TN (United States). Sep 1992. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From 6. annual New York State Institute on Superconductivity (NYSIS) conference on superconductivity and applications; Buffalo, NY (United States); 15-17 Sep 1992. Order Number DE93000448. Source: OSTI; NTIS; GPO Dep.

Magneto-thermodynamic property characterizations were selected, adapted, and compared to material property data for gadolinium gallium garnet in the temperature range 4–40 K and magnetic field range 0–6 T. The most appropriate formulations were incorporated into a model in which methods similar to those previously developed for other materials and temperature ranges were used to make limitation and relative performance assessments of Carnot, ideal regenerative, and pseudo-constant field regenerative cycles. Analysis showed that although Carnot cycle limitations on available temperature lift for gadolinium gallium garnet are not as severe as those for materials previously examined, substantial improvements in cooling capacity/temperature lift combinations can be achieved using regenerative cycles within specified field limits if significant loss mechanisms are mitigated.

2506 Thermal

738 (BFR-R–21-92) **Heat storage in clay.** Magnusson, C. (Geotechnical Inst., Linkoeping (SE)). Swedish Council for Building Research, Stockholm (Sweden). 1992. 84p. (In Swedish). Project BFR-860805-5. Order Number DE93721675. Source: OSTI; NTIS.

Heat pumps are used for charging and extracting heat to a clay layer, in a space heating system for a school and a sports area. The technical and economic performances of the heat store are evaluated. Operational experiences and collected data are analyzed. The performance of the heat exchangers show good agreement with simulations. The geotechnical examinations show small variations of parameters, settlements are less than 13 cm. (18 refs., 41 figs.).

739 (PNL-SA–20796) **Geohydrologic characterization for aquifer thermal energy storage.** Hall, S.H.; Raymond, J.R. Pacific Northwest Lab., Richland, WA (United States). Aug 1992. 23p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (CONF-920801–24: 27. intersociety energy conversion engineering conference, San Diego, CA (United States), 3-7 Aug 1992). Order Number DE92041333. Source: OSTI; NTIS; GPO Dep.

Successful operation of an aquifer thermal energy storage system depends on three elements: (1) the presence of a suitable aquifer for ground-water supply and energy storage; (2) the availability of a source of free or low-cost thermal energy, such as industrial waste heat or environmental chill; and (3) a temporal mismatch between thermal energy availability and thermal energy use. Using conventional hydrogeologic methods for aquifer characterization, the presence of a suitable aquifer is the most difficult of these three elements to assess quantitatively. By combining conventional methods with drift-and-pumpback and point-dilution single-well tracer tests, however, the rate of ground-water flow, the effective porosity, and the vertical distribution of hydraulic conductivity of the aquifer can be estimated quickly and economically.

740 (PNL-SA–21032) **Review of the aquifer seasonal thermal energy storage building HVAC system at the Melville, New York, Mid-Island Mall Facility.** Marseille, T.J.; Wilke, D.A. Pacific Northwest Lab., Richland, WA (United States). Aug 1992. 7p. Sponsored by USDOE, Washington, DC (United States); New York State Energy Research and Development Authority, Albany, NY (United States); Florida Atlantic Univ., Boca Raton, FL (United States). DOE Contract AC06-76RL01830. (CONF-920801–25: 27. intersociety energy conversion engineering conference, San Diego, CA (United States), 3-7 Aug 1992). Order Number DE92041330. Source: OSTI; NTIS; GPO Dep.

The successful widespread commercialization of aquifer thermal energy storage (ATES) in the United States will depend on the effectiveness with which the experiences gained from early full-scale systems are used as guides in the design, installation and operation of future projects. One such early system from which both anecdotal and quantitative information is available is the Mid-Island Postal Facility in Melville, New York. At this facility, built in the mid-1980s, an ATES system has been integrated with the building's central heating and cooling plant. "Cold" wells are charged with water that is cooled during the winter by heat pump and closed circuit cooler operation. Water from these cold wells is then used to meet the facility's cooling load during the summer, before being pumped back into the ground at "Warm" wells. Dehumidification during summer operation is accomplished by a liquid desiccant system that uses propane boilers to provide a heat source for desiccant regeneration. This system will also add water to the air during periods of low humidity. This paper provides an overview of the project, and describes the analysis being performed to assess energy and economic merits of this innovative system.

742 (LBL–32538) **The electrical conductivity of sodium polysulfide melts.** Meihui Wang. Lawrence Berkeley Lab., CA (United States). Jun 1992. 95p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00098. Order Number DE92041217. Source: OSTI; NTIS; GPO Dep.

The sodium polysulfide melt has been described by a macroscopic model. This model considers the melt to be composed of sodium cations, monosulfide anions, and neutral sulfur solvent. The transport equations of concentrated-solution theory are used to derived the governing equations for this binaryelectrolyte melt model. These equations relate measurable transport properties to fundamental transport parameters. The focus of this research is to measure the electrical conductivity of sodium polysulfide melts and calculate one of fundamental transport parameters from the experimental data. The conductance cells used in the conductivity measurements are axisymmetric cylindrical cells with a microelectrode. The electrode effects, including double-layer capacity, charge transfer resistance, and concentration overpotential, were minimized by the use of the alternating current at an adequately high frequency. The high cell constants of the conductance cells not only enhanced the experimental accuracy but also made the electrode effects negligible. The electrical conductivities of sodium polysulfide Na_2S_4 and Na_2S_5 were measured as a function of temperature (range: 300 to 360°C). Variations between experiments were only up to 2%. The values of the Arrhenius activation energy derived from the experimental data are about 33 kJ/mol. The fundamental transport parameter which quantifies the interaction within sodium cations and monosulfide anions are of interest and expected to be positive. Values of it were calculated from the experimental conductivity data and most of them are positive. Some negative values were obtained probably due to the experimental errors of transference number, diffusion coefficient, density or conductivity data.

The Ventures in Science summer program is directed towards students who are from underrepresented minority groups in mathematics and science professions. The target group of 40 was drawn from eligible students who will be entering high school freshman in the fall of 1992. 450 students applied. The theme for the summer is Chicago as an Ecosystem. The students are instructed in integrated math and science (2 hours), English/ESL (1 1/2 hrs.), counseling (1 hr.) and, physical education (1 hr.) each day four days a week. Integrated math and science are team taught. Parents are invited to participate in two workshops that will be presented based on their input. Parents may also visit the program at any time and participate in any field trip.

Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-91ER75658. Order Number DE93000425. Source: OSTI; NTIS; GPO Dep.

In 1991, the State of Alabama EPSCoR program was awarded DOE/EPSCoR Planning and Traineeship Grants to begin the processes needed to identify, then develop, a strong energy-related research and educational consortium involving industry, state and federal government, and, the six EPSCoR universities in the state.

Basically, Broad-based interests derived from early faculty surveys were used to direct recruitment activities identifying highly qualified students. Conversely, the broadly defined research thrust areas outlined in the Traineeship Grant were, in turn, used to develop campus visitation programs designed to measure institutional strength and commitment for energy-related research and education. The result of this type of synergism between the two DOE grants was that activities developed at higher levels of visibility, economy, efficiency and effectiveness – all of which enabled the directors to achieve a large number of targeted objectives over a short period of time. Likewise, the interest and enthusiasm generated during the early phases among faculty and students continue as both programs solicit proposals in directed RFP's for national peer review and, ultimately, for inclusion ion the Alabama Implementation Proposals later this year.

745 (DOE/ER/75660–1) **Mississippi graduate DOE EPSCor trainee project: First annual summary report.** Wertz, D.L. University of Southern Mississippi, Hattiesburg, MS (United States). Aug 1992. 36p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-91ER75660. Order Number DE92041115. Source: OSTI; NTIS; GPO Dep.

The promotion of an aggressive energy research initiative was identified as a goal of the Mississippi Research Consortium (MRC) from its inception in 1986. The Department of Energy EPSCOR Program has provided opportunities to address the needs and enhance the interactive programs of energy-related research in the State of Mississippi. The Mississippi DOE EPSCOR Graduate Traineeships Project is a program of education and research which will (1) increase the number of trained professionals in the energy sciences and technology, particularly those from groups traditionally under-represented in the field, and (2) interface with existing networks of universities, industry, federal, and state institutions involved in energy-related activities.

746 (DOE/ER/75663–1) **South Carolina DOE/EPSCoR energy-related graduate research traineeships: Progress performance report, September 30, 1991–September 29, 1992.** Durig, J.R. South Carolina Univ., Columbia, SC (United States). [1992]. 24p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-91ER75663. Order Number DE92041117. Source: OSTI; NTIS; GPO Dep.

The three primary objectives of the DOE/EPSCOR Traineeship Grant are to increase the number of US graduates with training in energy-related disciplines; to provide training and research experience through active participation in on-going energy research programs; and to ensure that the trainees obtain a broader understanding of energy-related research and technology.

747 (DOE/ER/75681–1) **MT DOE/EPSCoR planning grant: Annual technical progress report.** Bromenshenk, J.J.; Scruggs, V.L. Montana Univ., Missoula, MT (United States). 31 Aug 1992. 25p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-91ER75681. Order Number DE92041116. Source: OSTI; NTIS; GPO Dep.

The Montana DOE/EPSCoR planning process has made significant changes in the state of Montana. This is exemplified by notification from the Department of Energy's Experimental Program to Stimulate Competitive Research (DOE/EPSCoR) recommendation to fund Montana's 1992 graduate traineeship grant proposal in the amount of $500,000. This is a new award to Montana. DOE traineeship reviewers recognized that our planning grant enabled us to develop linkages and build the foundation for a competitive energy-related research and traineeship program in Montana. During the planning, we identified three major focus areas: Energy Resource Base, Energy Production, and Environmental Effects. For each focus area, we detailed specific problem areas that the trainees may research. We also created MORE, a consortium of industrial affiliates, state organizations, the Montana University System (MUS), tribal colleges, and DOE national laboratories. MORE and our state-wide Research and Education Workshop improved and solidified working relationships. We received numerous letters of support. DOE reviewers endorsed our traineeship application process. They praised the linkage of each traineeship with a faculty advisor, and the preference for teams of faculty members and two or more students. "Particularly commendable" were our programs to involve Native American educators and the "leveraging effect" of this on the human resources in the state. Finally, the DOE reviewers indicated that cost-sharing via support of Native Americans was creative and positive.

748 (DOE/ER/75682–1-Pt.4) **Kansas energy 2000: DOE/EPSCoR: Inventory of energy related assets, Wichita State University: [Annual report].** Legg, J.; Nellis, D.; Simons, G. Kansas State Univ., Manhattan, KS (United States). Mar 1992. 36p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-91ER75682. Order Number DE93001488. Source: OSTI; NTIS; GPO Dep.

The US Department of Energy is one of several federal agencies which has initiated an Experimental Program to Stimulate Competitive Research (EPSCoR). Generally, this program is intended to enhance the competitive ability of states that are underrepresented in the receipt of funds for research from federal agencies. Kansas State University, The University of Kansas, and Wichita State University, have received support from the US Department of Energy to begin the EPSCoR process in Kansas. The specific purposes of the DOE/EPSCoR program are to enhance the capability of Kansas to develop science and engineering personnel in energy-related areas and to conduct nationally competitive energy-related research.

749 (KTM/E-B–110) **IEA review of Finnish Energy policies 1991: IEA report 1991.** Ministry of Trade and Industry, Helsinki (Finland). 1992. 45p. (In Finnish). Order Number DE93721597. Source: OSTI; NTIS.

The International Energy Agency IEA reviewed the Finnish energy policy for the first time in 1991, as Finland was to join the organisation in the beginning of 1992. IEA analyzes annually member countries' energy situation and energy policies and gives recommendations to governments in this field. This report contains the Finnish review and it is a translated extract from the IEA country review report 'Energy Policies of IEA Countries - 1991 Review' to be published later. The report examines thoroughly energy demand and supply issues. Environment, development of energy technology and competition in the energy market receive attention as well. In general, the IEA assessment of the Finnish energy policy is quite positive. Policy is in line with the IEA objectives: the efficiency of the energy system has been continually improved, market-oriented elements have been introduced and the share of oil has declined considerably. There are, however, needs for further development. The main challenges, according to the IEA, are to assure compatibility of the partly conflicting goals of energy, economic and environment policies; to further improve energy efficiency; and to ensure sufficient capacity to meet growing demand for electricity. The most critical remarks focus on government subsidies and competitive conditions of the energy market. In particular, IEA pays attention to tax subsidies through VAT-system for indigenous fuels and natural gas, and to investment subsidies for infrastructure projects. The Agency considers that these may distort energy markets. The government should also ensure that enterprises in dominant position do not abuse their position.

750 (SA-PUB–9/89-Vol.1, pp. 158-166) **A validation of residual energy budgets from atmospheric circulation data against satellite measurements of the net radiation.** Fortelius, C. (Helsinki Univ. (Finland). Dept. of Meteorology). Academy of Finland, Helsinki (Finland). 1989. (CONF-8909491–Vol.1: Conference on climate and water, Helsinki (Finland), 11-15 Sep 1989). In *Conference on climate and water: Volume 1.* 520p. Order Number DE93721620. Source: OSTI; NTIS.

The distributions of the net sources of atmospheric dry and latent energy are evaluated by the residual technique, using the reanalyzed ECMWF FGGE level IIIb data for February and July 1979. Their sum (i.e., the estimated source of total energy) is compared to simultaneous Nimbus 7 ERB estimates of the radiation balance at the top of the atmosphere. Formally the difference between the two equals the net heat flux through the earth's surface. Over land the estimated total energy source should be nearly equal

to the radiation balance. The best agreement is found in July 1979 over the northern hemisphere middle latitudes, where monthly averages over large land-areas agree to within 10 W/m^2. In February, the residual is systematically too large by 20-40 W/m^2 over the same regions. Elsewhere, differences of up to 60 W/m^2 occur for corresponding averages. Over low latitude continents, the residuals are generally too small over convectively active regions and too large over subsidence regions. Over the oceans the difference between the net radiation and the total energy source compares favourably with available estimates of the climatological heat flux through the surface. The same is true for the residual source of latent energy and the fresh water flux through the surface.

751 (CONF-920828–10) **Future directions: Integrated resource planning.** Bauer, D.C. (Oak Ridge National Lab., TN (United States)); Eto, J. Oak Ridge National Lab., TN (United States). [1992]. 26p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From American Council for an Energy-Efficient Economy (ACEEE) summer study on energy efficiency in buildings; Pacific Grove, CA (United States); 30 Aug - 5 sep 1992. Order Number DE92040867. Source: OSTI; NTIS; GPO Dep.

Integrated resource planning or ERP is the process for integrating supply- and demand-side resources to provide energy services at a cost that balances the interests of all stakeholders. It now is the resource planning process used by electric utilities in over 30 states. The goals of IRP have evolved from least cost planning and encouragement of demand-side management to broader, more complex issues including core competitive business activity, risk management and sharing, accounting for externalities, and fuel switching between gas and electricity. IRP processes are being extended to other interior regions of the country, to non-investor owned utilities, and to regional (rather than individual utility) planning bases, and to other fuels (natural gas). The comprehensive, multi-valued, and public reasoning characteristics of IRP could be extended to applications beyond energy, e.g., transportation, surface water management, and health care in ways suggested in the paper.

752 (NEI-NO–291) **Petroleum taxation under uncertainty - contingent claims: Analysis with an application to Norway.** Lund, D. Oslo Univ. (Norway). Sosialoekonomisk Inst. 1990 18p. Order Number DE93721671. Source: OSTI; NTIS; INIS.

A workable method for the analysis of incentive effects of petroleum taxes under uncertainty is presented. The main advantage of the method is that it concludes with a single number for the after-tax value of any development plan, and thus allows for a quantification of incentive effects for any given description of production possibilities. It is, however, not possible to describe tax effects under uncertainty by simple magnitudes independent of production possibilities, such as wedges in rates of return. The theoretical basis is the contingent claims analysis from finance theory, which is applicable in particular to companies that are owned by well-diversified shareholders. It is not obvious that the tax authorities of poorly diversified countries should value uncertain income streams by the same method. The Norwegian petroleum taxation is shown to have strongly distortionary effects compared to a no-tax situation or a cash flow tax. These distortions were reduced by the tax changes that followed the 1986 decreases in crude oil prices. A weakness of the model of the Norwegian system is that an exactly optimal financial policy for the company has not been found. 30 refs., 2 figs., 3 tabs.

753 (ANL/RP–76696) **Production of a legislative environmental impact statement for the Chemical Weapons Convention: Background, format, and data requirements.** Lerner, K.; Tanzman, E.A. Argonne National Lab., IL (United States). 13 Jul 1992. 8p. Sponsored by Defense Nuclear Agency, Washington, DC (United States). DOE Contract W-31109-ENG-38. (DNA–001-90-C-0177). Order Number DE92040758. Source: OSTI; NTIS; GPO Dep.

This background paper addresses requirements for drafting a legislative environmental impact statement (LEIS) to accompany United States Senate approval of the proposed Chemical Weapons Convention (CWC).[1] It provides a brief description of the background and regulatory requirements of the National Environmental Policy Act of 1969 (NEPA)[2] and how those requirements would apply to the legislative process of approving and implementing the CWC. It also outlines the types of information typically presented in an EIS, and briefly explores the scope of issues to be addressed and data that would be needed in order to produce an LEIS for the CWC.

754 (CEA-CONF–10988) **Have hydraulic and nuclear power to be charged for greenhouse effect.** Charmant, A.; Ladoux, N.; Vielle, M. CEA, 75 - Paris (France). Mar 1992. 12p. (CONF-920532–: 15. annual conference of the International Association for Energy Economics, Tours (France), 18-20 May 1992). Order Number DE93721050. Source: OSTI; NTIS (US Sales Only); INIS.

Despite scientific uncertainties, there is a general agreement to ensure environmentally sound economic development, even if associated risks are in the very long term. To decrease carbon dioxide emissions, setting a carbon tax is often mentioned. Yet, some voices are claiming that such a tax, if decided, should be extended to all energy sources. The EEC project recommends to mix those two taxes but the French industry minister declared: We are trying to control the emissions of carbon dioxide by taxing all energy sources. This is like trying to combat alcoholism by also taxing orange juice. Beyond politician argumentation, the question of economic efficiency of each tax could be examined. That is, which is the best way, energy or carbon tax, to reach a CO_2 emission reduction target at least cost. Focusing on French economy through the Melodie model, we try to give some assessments about this question. By the year 2000, efficiencies of the two taxes are close, although energy tax is a bit more expensive. On the other hand carbon tax is unambiguously more efficient in the long run, let us say by 2010. The decision to stabilize carbon dioxide emission by 2000 at the 1990 level was adopted by the EEC Energy/Environment Committee on November the 20 th, 1990. As results, 2000 become, almost thoughtlessly, a preference target data. Will the 'no-regret' policy become the 'short-sighted' one.

755 (CONF-891098–15) **Potentials to transfer the US NEPA experience to developing countries.** Wilbanks, T.J.; Hunsaker, D.B. Jr.; Petrich, C.H.; Wright, S.B. Oak Ridge National Lab., TN (United States). [1989]. 32p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From The scientific challenges of NEPA: future directions based on 20 years of experience; Knoxville, TN (United States); 24-27 Oct 1989. Order Number DE92040705. Source: OSTI; NTIS; GPO Dep.

The US National Environmental Policy Act (NEPA) of 1969 has been important as a learning experience for the United States, but it has also served as a model for the rest of the world. In particular, other counties which benefit form US foreign aid have found NEPA concerns to be of growing importance in the 1980s and multinational bodies such as The World Bank have increasingly suggested US standards and practices as guidelines to countries without well-defined environmental policies of their own. With environmental protection becoming a dominant issue in development assistance, it is timely to assess the relevance of the US experience to developing countries. Other outgrowths of the NEPA process in the United States may be less appropriate to the conditions that exist in many developing countries. Examples might include standards for certain emissions, standards for impact analysis, the size and complexity of impact assessment documents, and mechanisms for public involvement. In these kinds of connections, the US NEPA experience is already becoming an issue in the expanding dialogue about global environmental change, Considered in the light of the experience of other advanced countries, such as West Germany and Great Britain, and in the light of differing circumstances of

less-developed countries, such as urgent needs for job creation and shortages of technical capabilities, the US experience has the potential to be transformed from what now appears too often to be a rigid straight-jacket to what can be a rich, robust body of lessons learned. In the process, an enhanced transfer of US professional experience and monitoring and control technologies can contribute to our competitiveness in the world economy and an acceleration of environmental management improvements in developing countries.

756 (GESAMP–48) **Global changes and the air-sea exchange of chemicals: Reports and studies. No. 48.** GESAMP-IMO/FAO/UNESCO/WMO/WHO/IAEA/UN/UNEP Joint Group of Experts on the Scientific Aspects of Marine Pollution. World Meteorological Organization, Geneva (Switzerland). 1991. 71p. Order Number DE93605636. Source: OSTI; NTIS (US Sales Only); INIS.

Present and future changes to global environment have implications for marine pollution and for air-sea exchange of both anthropogenic and natural substances. This report addresses 3 issues related to potential impact of global change on air-sea exchange of chemicals: Global change and air-sea transfer of nutrients nitrogen and iron. Global change and air-sea exchange of gases. Oceanic responses to radiative and oxidative changes in atmosphere. Deposition of atmospheric anthropogenic nitrogen has probably increased bio- productivity in coastal regions along continental margins. Atmospheric deposition of new nitrogen may also have increased productivity somewhat in mid-ocean regions. Projected future increases of N oxide emissions from Asia, Africa and South America will increase the rate of deposition of oxidized nitrogen to central North Pacific, equatorial Atlantic, and equatorial and central South Indian Oceans. Atmospheric iron may be an important nutrient in certain open regions. Future changes will likely occur from changed aridity and wind speed as a result of climate change. The most important future effects on surface ocean p_{CO2} will likely be caused by changes in ocean circulation. The pH of ocean would decrease by ≈0.3 units for a doubling of p_{CO2}, reducing the capacity of the ocean to take up CO_2. There is evidence that dimethyl sulfide from ocean is a source of cloud condensation nuclei and thus a factor controlling cloud albedo. By 2060 in the southern hemisphere reduction in total column stratospheric ozone from recent levels could reach 2 to 5% in the tropics, 10% at mid latitudes, and over 20% at 60 deg C. S. Increases in ground-level effective UV-B radiation could also reach 5%, 26% and 66%, at low, mid, and high latitudes in southern hemisphere. Changes in photochemical processes in the surface waters of the ocean could also happen.

757 (INIS-mf–13360) **IOC-CEC-ICES-WMO-ICSU ocean climate data workshop.** Workshop report. United Nations Educational, Scientific and Cultural Organization (UNESCO), 75 - Paris (France). Intergovernmental Oceanographic Commission (IOC). 1992. 32p. (CONF-9202130–: Ocean climate data workshop, Greenbelt, MD (United States), 18 Feb 1992). Order Number DE93603707. Source: OSTI; NTIS (US Sales Only); INIS.

The Ocean Climate Data Workshop organized in Greenbelt, Maryland, USA, on 18-21 February 1992 was attended by more than 100 people from 18 countries. The heart of the programme were three groupings of "Case Studies" in which scientists and data managers summarized findings on recent research projects and discussed data management aspects including recommendations for improvements needed for the future. Case studies were grouped into the following sessions: Monitoring Changes in the Ocean and Atmosphere; Data Archeology (Historical Data); Effect of Change in the Ocean and on the Life Cycle (Emphasis on Chemical and Biological Observations). A full range of technical matters associated with the collection and dissemination of data and meta-date were discussed. The topics covered were the problems associated with the increasing size of data sets like techniques for storage and retrieval of these data; increasing complexity of data (new data types especially in Chemistry and Biology, growing importance of meta-data and problems associated with the cost, formatting, storage and retrieval of this information); and for correlation of data sets across disciplinary lines, for instance development of a common geo-reference system.

758 (INIS-mf–13370) **IOC-UNEP regional workshop to review priorities for marine pollution monitoring, research, control and abatement in the wider Caribbean: Pt. 1 report, Pt. 2 marine pollution assessment and control programme for the wider Caribbean region - CEPPOL.** IOC workshop report. United Nations Educational, Scientific and Cultural Organization (UNESCO), 75 - Paris (France). Intergovernmental Oceanographic Commission (IOC). 1989. 114p. (CONF-8908295–: IOC-UNEP regional workshop to review priorities for marine pollution monitoring research, control and abatement in the wider Caribbean, San Jose (Costa Rica), 24 Aug 1989). Order Number DE93605628. Source: OSTI; NTIS (US Sales Only); INIS.

Also available in Russian and Spanish from IOC-UNESCO, Paris, France.

The IOC-UNEP Regional Workshop to Review Priorities for Marine Pollution Monitoring, Research, Control and Abatement in the Wider Caribbean Region (San Jose, 24-30 August 1989) examined a possible general framework for a regionally co-ordinated comprehensive joint IOC/UNEP programme for marine pollution assessment and control in the Wider Caribbean region (CEPPOL). The overall objective of CEPPOL is to establish a regionally co-ordinated comprehensive joint IOC/UNEP Marine Pollution Assessment and Control Programme catering to the immediate and long-term requirements of the Cartagena Convention as well as the requirements of the member States of IOCARIBE. The specific objectives of the programmes are: (i) To organize and carry out a regionally co-ordinated marine pollution monitoring and research programme concentrating on contaminants and pollutants affecting the quality of the marine and coastal environment, as well as the human health in the Wider Caribbean and to interpret/assess the results of the programme as part of the scientific basis for the region; (ii) To generate information on the sources, levels, amounts, trends and effects of marine pollution within the Wider Caribbean region as an additional component of the scientific basis upon which the formulation of proposals for preventive and remedial actions can be based; (iii) To formulate proposals for technical, administrative and legal pollution control, abatement, and preventive measures and to assist the Governments in the region in implementing and evaluating their effectiveness; and (iv) To strengthen and , when necessary, to develop/establish the capabilities of national institutions to carry out marine pollution monitoring and research, as well as to formulate and apply pollution control and abatement measures.

759 (NEDO-ITE–9101) **Survey of an evaluation method for CO_2 reduction technology in the chemical related industry field.** New Energy and Industrial Technology Development Organization, Tokyo (Japan). Mar 1992. 203p. (In Japanese). Sponsored by New Energy and Industrial Technology Development Organization, Tokyo (Japan). Order Number DE93723970. Source: OSTI; NTIS.

The method similar to the inter-industry relations analysis is proposed to establish the method for making a quantitative evaluation of the effects of various technologies for CO_2 emission reduction measures in the chemical related industry field. In the production process, a new concept, a cumulative CO_2 emission unit requirement (ϕ) is made an evaluation index. In each unit which composes the process, an in/out relationship of materials is expressed linearly, and it is supposed that the connection state between units is already known, and ϕ for raw materials and energy to be used and necessary expenses including equipment and personnel are given as initial conditions. Then, ϕ per product unit quantity can be introduced as a solution of the multidimensional simultaneous equation by the method similar to the inter-industry relations analysis. As basic data, the present situation of CO_2 emission and flow of materials/energy in the following three chemical related industries are studied: chemical/petrochemical, oil refining and food/pharmaceutical. As a result of trially applying the method to typical plants in the above-mentioned three industries in terms of the present technology and improved technology, validity of this evaluation method is confirmed and ϕ of each product can be calculated. 52 refs., 60 figs., 70 tabs.

760 (NEDO-ITE–9107) **Survey on fixation and utilization of carbon dioxide. (2).** New Energy and Industrial Technology Development Organization, Tokyo (Japan). Mar 1992. 223p. (In Japanese). Sponsored by New Energy and Industrial Technology

Development Organization, Tokyo (Japan). Order Number DE93723972. Source: OSTI; NTIS.

The paper surveys CO_2 fixation technology by which CO_2 is separated and recovered from stationary pollutant sources and converted to useful compounds by hydrogenation. The technology considers separation/concentration of CO_2, catalytic hydrogenation for methanol synthesis and optimization of the total system for hydrogen technology. The operative range of a separation/recovery absorption method and the improved type are proposed. For a zeolite PSA adsorption method, the two-step concentration process is suitable in terms of recovery and purity. Hollow fiber module membrane separation takes a little energy, but is difficult using the one-stage separation process and needs the two-stage separation process. The combined process in which the membrane separation process is for the front step and the adsorption method for the back step is worth studying in terms of recovery and purity. Hydrogenation for methanol synthesis is a fully practicable technique. Water electrolysis is indispensable for hydrogen production so far, but the subject is energy utilization in which no CO_2 is emitted. Studies are needed also on overseas hydroelectric power sources and biological hydrogen production such as chemical water decomposition by solar energy. Assuming that methanol is to be synthesized in Japan or overseas, profits and losses in each case of domestic or foreign synthesis of methanol are discussed, including production, storage and transportation problems. 119 refs., 100 figs., 71 tabs.

761 (NEI-DK–959) **Low electricity Europe - sustainable options.** Noergaard, J.S.; Viegand, J. Danmarks Tekniske Hoejskole, Lyngby (Denmark). Fysisk Lab. 3. Apr 1992 120p. Order Number DE93721472. Source: OSTI; NTIS.

The initiative for the study was taken by a small group of scientists etc. who were worried about the use of nuclear and fossil fuels and at the same time were aware of the potentials for a more efficient use of electricity. They were also interested in a new European approach to electricity planning. The study includes 15 West European countries, and the aim is environmental sustainability. It is emphasized how little electricity is really needed in the future. Supply options are briefly described. Data on possibilities for increasing efficiency for various end uses, such as lighting etc. are summarized. It is stated that factors which determine future electricity consumption are population, economic activity, standard of living and technological efficiency. It is concluded that over the next few decades, electricity consumption in Western Europe can be substantially reduced through implementation of a more efficient end-use technology. These technical savings will have a tendency to be eaten up by new demands if we continue to pursue a policy of economic growth. Only if we accept an economic saturation, it is claimed, can we attain a stable consumption of electricity which will be 45% below what it is now. This would make it possible, it is suggested, to phase out nuclear as well as coal power plants, and in general to achieve a sustainable electricity supply system. The methodology used makes it possible to analyze and present effects of better technologies, changes in economic structure etc. (AB) (87 refs.).

762 (NEI-NO–275) **Energy use and environmental consequences in the industrial sector.** Finden, P. (Institutt for Energiteknikk, Kjeller (NO)). Norsk Inst. for Luftforskning, Lillestroem (Norway); Institutt for Energiteknikk, Kjeller (Norway). 1990 20p. (In Norwegian). (CONF-9010522–2: Energy- and environmental perspectives for Norway, Kjeller (Norway), 11 Oct 1990). Order Number DE93721662. Source: OSTI; NTIS.

The present seminar paper evaluates the use of energy and the environmental consequences thereof in the industrial sector in Norway. The energy consumption varies more than 20% from one year to the next caused by fluctuations in the market or climatic variations. Data being analysed and presented concern the emitted volumes of climate-affecting gases from combustion sources, the total energy conservation potential of different energy carriers, and energy saving potentials as a function of investments and measures. 4 figs., 7 tabs.

763 (NEI-NO–276) **Energy use and environmental consequences: Building sector.** Skaaret, E. (Norges Byggforskningsinstitutt, Oslo (NO)). Norsk Inst. for Luftforskning, Lillestroem (Norway); Institutt for Energiteknikk, Kjeller (Norway). 1990 9p. (In Norwegian). (CONF-9010522–1: Energy- and environmental perspectives for Norway, Kjeller (Norway), 11 Oct 1990). Order Number DE93721663. Source: OSTI; NTIS.

The present seminar paper deals with the total energy use and the environmental consequences of energy conversion and the physical/chemical conditions in connection with the production and processing of materials in the building sector in Norway. Different energy conservation measures by utilizing new technologies in the existing building mass together with the use of new types of building materials in new designed buildings to satisfy the demands of building regulations are discussed. 4 figs.

764 (NEI-NO–288) **The oil market and international agreements on CO_2 emissions.** Berger, K. (Statistisk Sentralbyraa, Oslo (NO)); Fimreite, Oe.; Golombek, R.; Hoel, M. Oslo Univ. (Norway). Sosialoekonomisk Inst. 1991 32p. Order Number DE93721668. Source: OSTI; NTIS; INIS.

In order to avoid a relatively large risk of dramatic adverse climatic changes during the next century, greenhouse gas emissions must be reduced significantly relative to present emissions. CO_2 is the most important greenhouse gas, so any international agreement will certainly cover CO_2 emissions. Any international agreement to reduce emissions of CO_2 is going to have a significant impact on the markets for fossil fuels. The analysis shows that is not only the amount of CO_2 emissions permitted in an agreement which matters for fossil fuel prices, but also the type of agreement. Two obvious forms of agreements, which under certain assumptions both are cost efficient, are (a) tradeable emission permits, and (b) an international CO_2 tax. If the fossil fuel markets were perfectly competitive, these two types of agreements would have the same effect on the producer price of fossil fuels. However, fossil fuel markets are not completely competitive. It is shown that, under imperfect competition, direct regulation of the "tradeable quotas" type tends to imply higher producer prices than an international CO_2 tax giving the same total CO_2 emissions. A numerical illustration of the oil market indicates that the difference in producer prices for the two types of CO_2 agreements is quite significant. 6 refs., 2 figs., 1 tab.

765 (NEI-NO–289) **The valuation of environmental goods in Norway: A contingent valuation study with multiple bias testing.** Strand, J.; Taraldset, A. Oslo Univ. (Norway). Sosialoekonomisk Inst. 1991 45p. Order Number DE93721669. Source: OSTI; NTIS.

We report on a study of contingent valuation of reduction in air pollution, and of a broader set of six environmental issues, among a population sample in Oslo. We derive an estimate of the extent of upward bias due to "mental accouting" in the expressed valuation of the air pollution issue, in two steps: (1) by comparing valuation of air pollution alone, with the same when the other issues at the same time are to be dealt with; and (2) by deriving the implicit valuation of the air pollution issue from the ranking of issues, and total valuation of all six issues. We find that expressed valuation of air pollution reductions are 3-4 times as high as the "true" values, and argue that this discrepancy is mainly due to mental account biases. We also test for strategic, starting point, information and interviewer biases, which are all present and, with the exception of the information bias, all in the expected directions. 9 refs., 4 tabs.

766 (NEI-NO–290) **Tradable emission rights and strategic interaction.** Fehr, N.-H.M. von der. Oslo Univ. (Norway). Sosialoekonomisk Inst. 1991 38p. Order Number DE93721670. Source: OSTI; NTIS.

The use of economic instruments in the form of tradable emission rights, or pollution permits, have become increasingly popular as a means of implementing reductions in environmental damage. In the report it is shown that emission rights may create an instrument by which oligopolistic firms may try and influence their rivals' behavior. It is also shown how such strategic manipulation of the permit market may have anti-competitive, and, moreover negative welfare effects, in output markets. An alternative to emsission rights which do not have such strategic consequences, is emission charges. Emission charges have generally been criticised on the grounds that they require substantial information to implement given levels of environmental standards, whereas tradable emission rights can achieve such goals in a much more direct way without the need for

any information on demand and supply technologies in the regulated industries. The results of this paper provide additional support to the conclusion that against this argument should be set the possible anti-competitive effects of pollution permits. 16 refs., 3 figs.

767 (NINA-R–029) **Responses of climate change on natural terrestrial ecosystems in Norway.** Holten, J.I.; Carey, P.D. Norsk Inst. for Naturforskning, Trondheim (Norway). 1992. 59p. Order Number DE93721672. Source: OSTI; NTIS.

This report discusses possible effects of climatic and hydrological changes on Norwegian terrestrial ecosystems. Norway is tentatively subdivided into four ecoclimatic sensitivity regions, based on Norwegian climatic and hydrological scenarios. The most sensitive region is suggested to be alpine ecosystems including mountain forests (region I). The ecologically most significant factor for the changes in region I is snow cover and hydrology. The flat river valley bottom region (region IV) is suggested to have the same sensitivity as region I. Melting of permafrost can lead to substantial changes in Svalbard's ecosystems. In the forest region (region II) Scots pine may be favored on the expense of Norway spruce. Dutch elm disease may reduce or even eradicate most elm populations in region II. Natural and anthropogenic migration barriers will delay the invasion of temperature and oceanic plant species. One may expect enhanched biodiversity in the hemiboreal and southern boreal zone in South Norway, whereas Central Norway may have lowered biodiversity in the long run. From existing lists of rare and threatened plants, 12 species are suggested to be threatened (directly or indirectly) by climate change. A non-linear type of ecosystem changes is expected in most ecosystems, triggered by a higher frequency and intensity of extreme weather events. The assessment of critical rates and levels of climatic change and tolerance limits for species, will depend on much better knowledge on ecosystem dynamics and processes, especially demographic processes. The ecotonal boundary method is recommended both for research and monitoring. 59 refs., 14 figs., 2 tabs.

768 (SA-PUB–9/89-Vol.2, pp. 275-289) **The impact of climate on the operation of the French electric system.** Duband, D. (Electricite de France (EDF), 38 - Grenoble (France)); Rabut, P.; Clavel, P.; Leveugle, J. Academy of Finland, Helsinki (Finland). 1989. (CONF-8909491–Vol.2: Conference on climate and water, Helsinki (Finland), 11-15 Sep 1989). In *Conference on climate and water: Volume 2.* 393p. Order Number DE93721621. Source: OSTI; NTIS.

The paper describes how EDF incorporates climatic parameters in solving three particular problems: water resource management and streamflow forecasting, energy consumption forecasting and the joint operation of a mixed system including hydroelectric and thermal power plants under highly uncertain conditions for the future. Several perspectives are discussed on the sensitivity of these approaches to climatic variations.

769 (SNV–4033) **New technology for refrigeration and heating plants.** Joensson, U. (A.C. Nielsen Company AB, Kista (SE)); Stenberg, P.; Pettersson, A.H.; Rizell, P.O. Swedish Environmental Protection Agency, Solna (Sweden). Mar 1992. 48p. Order Number DE93721673. Source: OSTI; NTIS.

Also available in Swedish as SNV–4020.

The report is an account of a project which aimed at making a survey of the technical development of refrigeration and heating pump plants against the background of international and national plans to phase out the use of CFC and HCFC refrigerants. The report is not intended to give full coverage of the market: instead, its purpose is to give examples of technology which allow for reductions in the use of CFC and HCFC refrigerants. The account describes the technical development position in the autumn of 1991. The consultancy is responsible for the contents of the report. (au).

770 (YMP-R–87/1990) **Reponsiveness of Finnish science and technology institutions to environmental change.** Talsi, T. (ed.). Ministry of the Environment, Helsinki (Finland). Environmental Protection Dept. 1990. 58p. Order Number DE93711141. Source: OSTI; NTIS.

This report was compiled as the Finnish contribution to the OECD/CSTP project 'Responsiveness of Science and Technology Institutions to Environmental Change'. The report focusses on the general development of Finnish environmental policies during 1960-1990 and the impact of environmental concerns on policy planning in other sectors of society during the 1980s. The section dealing with the development of science and technology policies outlines how the changes in environmental policies and the growing importance attached to environmental protection has been reflected in the Finnish science and technology institutions (policies, funding and funded institutions) and their objectives. The report presents two examply of environment related research, namely, acidification research and RAD related to forest industry effluents.

2904 Energy Resources

771 (IFP–39657) **Energy demand modelling: pointing out alternative energy sources. The example of industry in OECD countries.** Renou, P. Institut Francais du Petrole (IFP), 92 - Rueil-Malmaison (France). 19 Feb 1992. 465p. (In French). Order Number DE93720904. Source: OSTI; NTIS (US Sales Only); INIS.

This thesis studies energy demand and alternative energy sources in OECD countries. In the first part, the principal models usually used for energy demand modelling. In the second part, the author studies the flexible functional forms (translog, generalized Leontief, generalized quadratic, Fourier) to obtain an estimation of the production function. In the third part, several examples are given, chosen in seven countries (Usa, Japan, Federal Republic of Germany, France, United Kingdom, Italy, Canada). Energy systems analysis in these countries, can help to choose models and gives informations on alternative energies. 246 refs., 24 figs., 27 tabs.

772 (NEI-NO–283) **Energy resource planning: A conceptual study of a multiobjective problem.** Johansen, S.E. Trondheim Univ. (Norway). Norges Tekniske Hoegskole. 1992 248p. Order Number DE93721639. Source: OSTI; NTIS.

This report is a conceptual study of the Energy Resource Planning (ERP) task as a multiobjective planning problem. Traditionally, the ERP task is approached with extensive application of economic and technical/process-oriented methods of analysis. Cost minimization and feasibility constraints usually serve as a basis on which to make resource selections, thus, in principle solving the ERP task as a constrained, single criterion, optimization problem. This study recognizes and emphasizes the ERP task as being a multiobjective planning task. For example, that the ERP task involves multiple planning objectives, of which many are intangible, noncommensurable and conflicting. The study performs an extended formulation of the ERP task, and emphasises two different categories of solution approaches, distinguished by their conceptually different treatment of planning objectives, i.e. the quantitative approach and the qualitative approach. The quantitative approach involves the value achievement of relevant planning objectives in representative monetary terms (costs) as function(s) of resource alternatives. A preferred resource plan is then identified as the least cost plan, in the multiobjective sense. Thus, the monetized values represent a basis on which to select the best compromise plan. An extensive discussion of environmental costs clearly illustrates complexities and applicability of the quantitative approach to the ERP task. The qualitative approach recognizes achievement of all relevant planning objectives as not possible to appropriately value in monetary terms. Rather, the range of resource choice and trade-offs between objectives is identified and communicated to decisionmaker(s). A best compromise resource plan is selected based implicitly on decisionmaker(s) preferences and value tradeoffs. 98 refs., 42 figs., 5 tabs.

773 (SA-PUB–9/89-Vol.2, pp. 383-393) **Study of water resources systems operation taking account of climatic changes.** Shnaidman, V.M. (USSR Academy of Sciences, Moscow (USSR). Water Problems Institute). Academy of Finland, Helsinki (Finland). 1989. (CONF-8909491–Vol.2: Conference on climate and water, Helsinki (Finland), 11-15 Sep 1989). In *Conference on climate and water: Volume 2.* 393p. Order Number DE93721621. Source: OSTI; NTIS.

A method, based on the investigation of water resources system sensitivity using a simulation model is suggested to estimate the system response to man-induced climatic changes. The paper discusses the state-of-the-art of the problem, the general scheme of its investigation, the way of developing the simulation model and methods of simulation experiments for irrigational water resources systems.

The state of Kansas during the year 30 September 1991 to 29 September 1992 has accomplished a variety of objectives in its Department of Energy/Experimental Program to Stimulate Competitive Research (DOE/EPSCoR) planning process. As a new EPSCoR state, it has had to develop its management organization. This has been accomplished, with the result that EPSCoR is under the aegis of a body charged with planning the economic development of the state. An inventory of research assets and needs was performed and a report of the results of that inventory was produced. A DOE/EPSCoR Steering Committee was formed. This working committee met at least twice a month in the spring of 1992 doing strategic planning as well as giving guidance for the traineeship proposal recently funded. This committee identified certain priority areas for development by the DOE/EPSCOR project: Environment, Geology, Materials Science, Nuclear Science and Engineering, Alternate Sources and Efficiencies in Power Generation, Basic Sciences, and the Educational Pipeline. A call for proposals from state research groups has resulted in thirty-nine proposals in these priority areas. The best of them will then be selected for inclusion in the state's implementation plan and proposal.

775 (LBL–32385) **World energy: Building a sustainable future.** Schipper, L.; Meyers, S. Lawrence Berkeley Lab., CA (United States). Apr 1992. 118p. Sponsored by Stockholm Environment Inst. (Sweden). DOE Contract AC03-76SF00098. Order Number DE93001598. Source: OSTI; NTIS; GPO Dep.

As the 20th century draws to a close, both individual countries and the world community face challenging problems related to the supply and use energy. These include local and regional environmental impacts, the prospect of global climate and sea level change associated with the greenhouse effect, and threats to international relations in connection with oil supply or nuclear proliferation. For developing countries, the financial cost of providing energy to provide basic needs and fuel economic development pose an additional burden. To assess the magnitude of future problems and the potential effectiveness of response strategies, it is important to understand how and why energy use has changed in the post and where it is heading. This requires study of the activities for which energy is used, and of how people and technology interact to provide the energy services that are desired. The authors and their colleagues have analyzed trends in energy use by sector for most of the world's major energy-consuming countries. The approach we use considers three key elements in each sector: the level of activity, structural change, and energy intensity, which expresses the amount of energy used for various activities. At a disaggregated level, energy intensity is indicative of energy efficiency. But other factors besides technical efficiency also shape intensity.

776 (YMP-MUIST–5/1991) **Development programme for air pollution control research 1991-1995.** Savolainen, K.; Juntto, S. Ministry of the Environment, Helsinki (Finland). Environmental Protection Dept. 1991. 45p. (In Finnish). Order Number DE93711148. Source: OSTI; NTIS.

The programme comprises the most important air pollution control research entities in the years 1991 - 1995. It also contains the required ancillary functions: research coordination and follow-up, post-graduate education, and increased utilization of research results. The present programme discusses the implementation of the first research programme for air quality management 1986 - 1990 and recent air pollution research. The discussion of research needs is based on the air pollution control cycle. Research projects are not listed; instead, the programme presents major entities without giving priorities with regard to importance or extent. In every field there is a presentation of a few important our urgent research projects. The research fields requiring the main additional input are air chemistry and environmental health. Economic research on air pollution should be developed as part of environmental economics.

2906 Nuclear Energy

777 (CEA-CONF–10966) **Perspectives of nuclear Energy in Europe.** Naudet, G. CEA, 75 - Paris (France). 1992. 6p. (In French). (CONF-9204204–: The Kangaroo Group Energy Conference, Paris (France), 3-4 Apr 1992). Order Number DE93721209. Source: OSTI; NTIS (US Sales Only); INIS.

In this paper the author evokes the contribution of nuclear energy in the European Community energy provisioning for the year 2010.

778 (INIS-mf–13359) **A framework for discussion on the environment.** Department of the Environment, Ottawa, ON (Canada). 1990 70p. (In English, French). Order Number DE93604021. Source: OSTI; NTIS (US Sales Only); INIS.

This document outlines the measures the government of Canada proposes to take in order to make Canada the world's most environmentally friendly country. The reflection and discussion that this document generates will influence the order of priority in the final action plan.

779 (INIS-mf–13364) **Safety culture: Report by the International Nuclear Safety Advisory Group.** Bezpecnost Jademych Zarizeni. Beninson, D. (and others); Birkhofer, A.; Chatterjee, S.K.; Domaratzki, Z; Edmontson, B.; Gonzalez-Gomez, E.; Hoehn, J.; Kouts, H.J.C.; Lepecki, W.; Sato, K. Ceskoslovenska Komise pro Atomovou Energii, Prague (Czechoslovakia). 1992 24p. Translation of a report by the International Nuclear Safety Advisory Group; IAEA Safety Series No. 75-INSAG-4. (In Czech). Order Number DE93605958. Source: OSTI; NTIS (US Sales Only); INIS.

The response to a previous publication by the International Nuclear Safety Advisory Group (INSAG) indicated a broad international interest in expanding the concept of Safety Culture in such a way that its effectiveness in particular cases may be judged. This report responds to that need. In its manifestation, Safety Culture has two major components: the framework determined by organizational policy and by managerial action, and the response of individuals in working within and benefiting by the framework. 1 fig.

780 (KAERI/RR–1051/91) **A study on enhancing the utilization of nuclear power in Korea: With reference to the role of nuclear in solving the global warming problem and to the nuclear export control system.** Choi, Young Myung (Korea Atomic Energy Research Inst., Daeduk (Korea, Republic of)); Han, Do Hee; Lee, Byung Wook; Lee, Kwang Seok; Lee, Jae Sung; Choi, Young Lok; Jo, Se Hyun; Lee, Han Myung; Won, Byung Chool; Park, Sung Gi. Korea Atomic Energy Research Inst., Daeduk (Korea, Republic of). Jan 1992. 101p. (In Korean). Order Number DE93605590. Source: OSTI; NTIS (US Sales Only); INIS.

As the world recognizes the global warming problem as an important issue it has to solve, nuclear power is being considered as a way to solve the problem. This study reviews (1) what the global warming problem is, (2) why the problem occurs, and (3) how the problem can be solved. This study also review international effort to solve the problem in terms of intergovernmental negotiation on climate change and its effect on Korea. This study discusses the role of nuclear power in solving the problem, contrasting the argument of those who object to the use of nuclear power. With the argument of those who agree to the use of nuclear power. This study reviews and analyzes recent changes in the international nuclear society; especially fortification of special inspection and safeguards by the IAEA, and attempt to append dual purpose items to London

Guidelines. This study reviews the history of the Nuclear Non-Proliferation Act in the USA in terms of its background and role. This study discusses the Nuclear proliferation Prevention Act which was proposed recently in the USA. This study suggests policies Korea should take to respond to the changes effectively. (Author).

781 (NEDO-P–9107) **Study on the clean energy network sytem for the global environment.** New Energy and Industrial Technology Development Organization, Tokyo (Japan). Mar 1992. 169p. (In Japanese). Sponsored by New Energy and Industrial Technology Development Organization, Tokyo (Japan). Order Number DE93723962. Source: OSTI; NTIS.

The paper confirms the concept of the global energy network system and also studies practical applicability of a clean energy transportation system by studying energy balance, prediction survey of utilization forms and field survey of overseas cases. This system produces hydrogen by water electrolysis using hydroelectric/photovoltaic power generation, etc. in the area which has rich renewable energy, converts it to hydrogen derivatives such as liquefied hydrogen or methanol in consideration of transportability and transports them to the areas where they are used as extensive energy sources for power generation, transportation and town gas. To make a quantitative evaluation of this system, conducted are estimation of suppliable hydroelectric resource, trial calculation of energy balance ratio of the system study of CO_2 reduction effect and prediction of the amount of hydrogen energy to be introduced. Moreover, validity of the system can be evaluated in comparison of economy between the Euro Quebec project and this system in the overseas field survey. 57 refs., 36 figs., 39 tabs.

783 (LBL–32214) **Persistence of energy savings: What do we know and how can it be ensured?.** Vine, E. Lawrence Berkeley Lab., CA (United States). May 1992. 23p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00098. (CONF-920828–14: American Council for an Energy-Efficient Economy (ACEEE) summer study on energy efficiency in buildings, Pacific Grove, CA (United States), 30 Aug - 5 sep 1992). Order Number DE92041188. Source: OSTI; NTIS; GPO Dep.

This paper presents a conceptual framework for analyzing persistence of energy savings, summarizes the limited experience of what we know about persistence, provides guidance for conducting retrospective and prospective persistence studies, and suggests strategies for ensuring persistence. Because this area of research is in its infancy, unequivocal conclusions about persistence would be premature. Accordingly, this paper provides guidance for both conducting research in this area and developing policies and mechanisms to help ensure the persistence of energy savings.

784 (LBL-PUB–5330) **The California Institute for Energy Efficiency multiyear research plan, 1992–1996.** Lawrence Berkeley Lab., CA (United States). Jul 1992. 154p. Sponsored by USDOE, Washington, DC (United States); California Inst. for Energy Efficiency, Berkeley, CA (United States). DOE Contract AC03-76SF00098. Order Number DE93000577. Source: OSTI; NTIS; GPO Dep.

The mission of the California Institute for Energy Efficiency (CIEE) is to coordinate, plan, and implement a statewide program of medium- to long-term (five to fifteen years) applied research aimed at advancing the energy efficiency and productivity of all end-use sectors in California. The focus of CIEE's multiyear research and development (R&D) program is to benefit California's ratepayers within the context of the state's energy, environmental, and economic needs and priorities. This context includes the current research efforts of CIEE's sponsors, of significant national R&D organizations, and of industry. CIEE's 1992–1996 Multiyear Research Plan guides the Institute's research development, research management, and technology transfer efforts. The Plan briefly describes CIEE's current R&D program and introduces potential R&D initiatives that are responsive to California's unmet energy efficiency needs. In 1992, CIEE is planning, funding, and managing $5 million in multiyear research, exploratory research, Director's discretionary research, and technology transfer activities. The Institute's 1992 effort includes $3.6 million in multiyear research conducted in the Building Energy Efficiency, Air Quality Impacts of Energy Efficiency, and End-Use Resource Planning programs and $1 million in exploratory and Director's discretionary research. During the period 1992 to 1996, CIEE will continue to conduct energy efficiency R&D that will secure sustainable, affordable energy for California while improving the state's economy and environment.

785 (PNL–8225) **Impact evaluation of an energy $avings plan project at Elf Atochem North America.** Brown, D.R.; Spanner, G.E. Pacific Northwest Lab., Richland, WA (United States). Aug 1992. 20p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE93000838. Source: OSTI; NTIS; INIS; GPO Dep.

This impact evaluation of an energy conservation measure (ECM) that was recently installed at Elf Atochem North America (Atochem) was conducted for the Bonneville Power Administration (Bonneville) as part of an evaluation of its Energy savings Plan (E$P) Program. The Program makes acquisition payments to firms that install energy conservation measures in their industrial processes. The objective of this impact evaluation was to assess how much electrical energy is being saved at Atochem as a result of the E$P and to determine how much the savings cost Bonneville and the region. The impact of the ECM was evaluated with a combination of engineering analysis, financial analysis, site visit and interview, review of previous program submittals and review of process evaluation results from 1989. The ECM itself consists of adding anode area to each of the sodium chlorate (chlorate) cells at Atochem's Tacoma facility. Increasing the anode area reduces the current density, which reduces cell resistance at the same current, thus reducing energy consumption at the same chlorate production rate. Energy savings resulting from this ECM are expected to average about 24,000,000 kWh/yr or about 1000 kWh/ton of chlorate produced. The net cost of the ECM was $1,410,400, and Atochem received a payment of $212,500 from Bonneville for the acquisition of energy savings. The levelized cost of these energy savings to Bonneville will be 0.7 mills/kWh over the ECM's expected 15-year life, and the levelized cost to the region will be 5.7 mills/kWh. Bonneville's offer to pay Atochem $212,500 via the E$P Program was viewed by Atochem management as a big incentive that made a difference.

786 (PNL–8336) **A review of selected energy-related data sets.** Nicholls, A.K. (Pacific Northwest Lab., Richland, WA (United States)); Elliott, D.B.; Jones, M.L.; Hannifan, J.M.; Degroat, K.J.; Eichner, M.J.; King, J.E. Pacific Northwest Lab., Richland, WA (United States). Sep 1992. 167p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE93002180. Source: OSTI; NTIS; GPO Dep.

DOE's Office of Planning and Assessment (OPA) performs cross-cutting technical, policy, and environmental assessments of energy technologies and markets. To support these efforts, OPA is in the process of creating a data base management system (DBMS) that will include relevant data compiled from other sources. One of the first steps is a review of selected data sets that may be considered for inclusion in the DBMS. The review covered data sets in five categories: buildings-specific data, industry-specific data,

transportation-specific data, utilities-specific data, and crosscutting/general data. Reviewed data sets covered a broad array of energy efficiency, renewable, and/or benchmark technologies. Most data sets reviewed in this report are sponsored by Federal government entities and major industry organizations. Additional data sets reviewed are sponsored by the states of California and New York and regional entities in the Pacific Northwest. Prior to full review, candidate data sets were screened for their utility to OPA. Screening criteria included requirements that a data set be particularly applicable to OPA's data needs, documented, current, and obtainable. To fully implement its DBMS, OPA will need to expand the review to other data sources, and must carefully consider the implications of differing assumptions and methodologies when comparing data.

2920 Supply, Demand, and Forecasting

787 (ANL/CP–77467) **ENPEP: An integrated approach to energy planning.** Hamilton, B.P.; Cirillo, R.R.; Buehring, W.A. Argonne National Lab., IL (United States). [1992]. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-9209160–16: International symposium on energy, environment and information management, Argonne, IL (United States), 15-18 Sep 1992). Order Number DE92041085. Source: OSTI; NTIS; GPO Dep.

Many models have been developed to analyze various aspects of the energy system. The Energy and Power Evaluation Program (ENPEP) is a set of microcomputer-based energy planning tools that are designed to provide an integrated analysis capability. ENPEP begins with a macroeconomic analysis, develops an energy demand forecast based on this analysis, carries out an integrated supply/demand analysis for the entire energy system, evaluates the electric system component of the energy system in detail, and determines the impacts of alternative configurations. This approach is an enhancement of existing techniques in that it places emphasis on looking at the electric system as an integral part of the entire energy supply system. Also, it explicitly considers the impacts the power system has on the rest of the energy system and on the economy as a whole.

788 (NEDO-P–9122) **Research on very long-term energy supply and demand. (3).** New Energy and Industrial Technology Development Organization, Tokyo (Japan). Mar 1992. 215p. (In Japanese). Sponsored by New Energy and Industrial Technology Development Organization, Tokyo (Japan). Order Number DE93723969. Source: OSTI; NTIS.

A model is developed which can simulate a relationship between the new energy cost, the amount of new energy to be politically introduced and the amount of new energy to be introduced based on the market mechanism as a tool for analysis of new energy introduction. The model targets a very long period by 2030 and by giving it parameters concerning new energy costs and the conventional energy forecast as variables, the future new energy introduction amount and the conventional energy amount to be replaced thereby can be comprehended by sector. The amount is divided into the following sectors: market, electric utilities, industry, residence/commerce and transportation. The analysis of effects on CO_2 emission can also be made. The model is composed of the following systems: very long-term energy supply demand model calculation, input interactive type and output interactive type. Various kinds of the analysis on new energy introduction can contribute to making and introducing the future new energy policy. 26 figs., 43 tabs.

789 (SA-PUB–9/89-Vol.2, pp. 245-274) **Global climatic change: implications for energy policy.** Abrahamson, D. (Minnesota Univ., Minneapolis, MN (US). Hubert H. Humphrey Institute of Public Affairs); Johansson, T.B. Academy of Finland, Helsinki (Finland). 1989. (CONF-8909491–Vol.2: Conference on climate and water, Helsinki (Finland), 11-15 Sep 1989). In *Conference on climate and water: Volume 2.* 393p. Order Number DE93721621. Source: OSTI; NTIS.

Global climatic change will heavily impact the energy sector: Existing energy systems will be affected by changes in temperature, precipitation, river flows, and temperature-sensitive energy demands; The energy supply system will be much more affected by measures to limit climatic change. To formulate strategies to limit climatic change requires the simultaneous consideration of other criteria such as the need to provide for world-wide economic development, global security implications of dependence on Persian Gulf oil and large-scale nuclear power, and environmental restrictions. The two key strategies are effective use of energy and the use of renewable energy sources. Technologies are available to reduce energy consumption in industrialized countries by at least 50 percent without loss of energy services and meeting the usual tests of economic efficiency. Photovoltaic systems suitable for small- and large-scale applications are on the near horizon, as are advanced fuel cells and advanced gas turbines which may be coupled with biomass gasification plants. Energy conservation and renewable energy supplies are no longer optional, they are now required if climate change is to be limited.

In the field of public transport, the most important part of the central government has been to provide the necessary framework in the form of legislation and other provisions. However, in the field of railway transport, the government plays a direct, active role. Bus and coach transport is highly decentralized. The responsibility for public transport is very much a local matter. The underlying principle is that the right to decide and the responsibility to be held go with the funding. In 1990 the government prepared a transport action plan, which contains a number of goals to be reached and a number of possible courses of action to be taken. One of the core elements of the transport action plan is to use the most ecofriendly and energy-saving means of transport. In a number of situations, public transport is the right answer. The fiscal bill for 1992 provides pool funds to follow up on the transport action plan, aiming at making public transport more environmentally benign. A new initative in the field of transport is a Transport Board, whose job will be to promote research, strengthen and build up research environments and promote the training of scientists. Furthermore, the Transport Board must promote Danish participation in international research and the channeling of research results, in addition to having analyses made upon the wish of the Danish Parliament or the government. (au).

791 (NORD–91-53) **Energy for Europe - resources, economy, cooperation: Report from a Nordic council seminar.** Nordic Council, Stockholm (Sweden). 1991. 94p. (CONF-9110419–: Energy for Europe, Oslo (Norway), 14-15 Oct 1991). Order Number DE93711221. Source: OSTI; NTIS.

At the seminar the plans for an all-European energy policy also including countries outside the European Community, were presented and discussed. The energy situation of Europe with its economic, environmental and social aspects was illustrated by several representatives of Nordic and East European countries. The reports gives an account of the main points made by the speakers, and does not present a full record of the proceedings.

This publication presents information and compiled data on energy sources. The following information is presented: energy overview; energy consumption; petroleum; natural gas; oil and gas resource development; coal; electricity; nuclear energy; energy prices; and international energy.

793 (DOE/EIA–0109(92/09)) **Petroleum supply monthly, September 1992.** USDOE Energy Information Administration, Washington, DC (United States). Office of Oil and Gas. 28 Sep 1992. 158p. Sponsored by USDOE, Washington, DC (United States). Order Number DE93000624. Source: OSTI; NTIS; GPO; GPO Dep.

Data presented in the PSM describe the supply and disposition of petroleum products in the United States and major US geographic regions. The data series describe production, imports and exports, inter-Petroleum Administration for Defense (PAD) District movements, and inventories by the primary suppliers of petroleum products in the United States (50 States and the District of Columbia). The reporting universe includes those petroleum sectors in Primary Supply. Included are: petroleum refiners, motor gasoline blenders, operators of natural gas processing plants and fractionators, inter-PAD transporters, importers, and major inventory holders of petroleum products and crude oil. When aggregated, the data reported by these sectors approximately represent the consumption of petroleum products in the United States. Data presented in the PSM are divided into two sections (1) the Summary Statistics and (2) the Detailed Statistics.

794 (DOE/EIA–0543(92/2Q)) **US Energy Industry Financial Developments: 1992 Second quarter.** USDOE Energy Information Administration, Washington, DC (United States). Office of Energy Markets and End Use. Sep 1992. 19p. Sponsored by USDOE, Washington, DC (United States). Order Number DE92041309. Source: OSTI; NTIS; INIS; GPO; GPO Dep.

In the second quarter of 1992, the financial performance of the US petroleum industry continued to deteriorate, as weakening domestic economic growth slowed the demand for refined petroleum products. Net income for 119 petroleum companies–including 19 major oil and gas producers–declined 2 percent between the second quarter of 1991 and the second quarter of 1992, and was down 35 percent for the first 6 months of 1992. Unless otherwise stated, all quarterly comparisons relate to the second quarter of 1992 versus the second quarter of 1991. Weak margins reduce downstream earnings; higher prices increase oil and gas production earnings; industry downsizing improves financial results; oil and gas drilling remains depressed; cool spring helps gas companies but disappoints electric utilities.

795 (ANL/CP–77471) **Applying environmental externalities to US Clean Coal Technologies for Taiwan.** Szpunar, C.B.; Gillette, J.L. Argonne National Lab., IL (United States). [1992]. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-9209160–14: International symposium on energy, environment and information management, Argonne, IL (United States), 15-18 Sep 1992). Order Number DE92041087. Source: OSTI; NTIS; INIS; GPO Dep.

During the period 1971 to 1980, electricity consumption in Taiwan increased remarkably at an average rate of 12.2% per year. Despite experiencing a record low in 1982 and 1983, electricity demand returned to double digit growth, reaching 11.6% and 10.2% in 1987 and 1988, respectively, due to a strong economic recovery. In 1988, 71.6 TWh of electricity was produced, 21.1 TWh of which was from coal-fired units (29%). The electricity demand for Taiwan is expected to continue to grow at a very rapid rate during the 1990–2006 time frame. The average load is expected to grow at an annual rate of 5.6% while the peak load is projected to increase at an annual rate of 6.0%. All new coal-fired power plants are expected to comply with government regulations on SO_2, NO_x, and particulate emissions. Taper reports that all of its proposed coal-fired units will be equipped with modern flue gas emission reduction devices, such as electrostatic precipitators or baghouse filters, flue gas desulfurization and $deco_x$ devices, to reduce the pollutants to their minimum practical levels. New coal-based generation requirements in the sizes needed in Taiwan create an opportunity for several of the Cats currently under demonstration in the United States. Options to be considered are described.

796 (ANL/EAIS/TM–76) **C&RE-SLC: Database for conservation and renewable energy activities.** Cavallo, J.D.; Tompkins, M.M.; Fisher, A.G. Argonne National Lab., IL (United States). Environmental Assessment and Information Sciences Div. Aug 1992. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. Order Number DE93001929. Source: OSTI; NTIS; GPO Dep.

The Western Area Power Administration (Western) requires all its long-term power customers to implement programs that promote the conservation of electric energy or facilitate the use of renewable energy resources. The hope is that these measures could significantly reduce the amount of environmental damage associated with electricity production. As part of preparing the environmental impact statement for Western's Electric Power Marketing Program, Argonne National Laboratory constructed a database of the conservation and renewable energy activities in which Western's Salt Lake City customers are involved. The database provides information on types of conservation and renewable energy activities and allows for comparisons of activities being conducted at different utilities in the Salt Lake City region. Sorting the database allows Western's Salt Lake City customers to be classified so the various activities offered by different classes of utilities can be identified; for example, comparisons can be made between municipal utilities and cooperatives or between large and small customers. The information included in the database was collected from customer planning documents in the files of Western's Salt Lake City office.

797 (CONF-9210170–1) **Key factors affecting the success of Demand-Side Management collaboratives.** Schweitzer, M. (Oak Ridge National Lab., TN (United States)); Raab, J. Oak Ridge National Lab., TN (United States). Sep 1992. 14p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From 1992 International Energy Efficiency (IEE) and Demand Site Management (DSM) conference; Toronto (Canada); 20-22 Oct 1992. Order Number DE92041253. Source: OSTI; NTIS; GPO Dep.

In recent years, many utilities and nonutility parties (NUPs) across the country have tried a new approach to reaching agreement on Demand-Side Management (DSM) program design and policy issues. The DSM collaborative process, as it is called, represents an attempt by groups that have often been adversaries to work together intensively from the very beginning of the DSM planning process to reach consensus on the issues that have separated them and to produce a plan that is mutually acceptable to all parties. The NUPs involved in collaboratives include environmental and consumer groups, state agencies, and sometimes staff of the regulatory agencies. In a recent study, we analyzed nine cases of DSM collaboration in ten states. These collaboratives have involved 24 utilities and over 50 NUPs in 10 states. The size of the collaboratives ranged from just two parties in the New England Electric System (NEES) - Conservation Law Foundation of New England (CLF) Collaborative to 28 in the Wisconsin Collaborative. The collaboratives included in this study constitute the majority of DSM collaboratives underway at the time this study was initiated and include those with the longest track records. Our study examined the context and organization of DSM collaboratives and the extent to which these collaboratives were successful. Success was measured by a broad array of criteria, including the achievement of consensus by collaborative participants, approval of the resulting DSM plan by state regulators (e.g., Public Utility Commissions) and courts, satisfaction of participants' objectives, savings of time and money compared to the likely results of traditional litigation, and changes in historic relations among the parties. We were able to identify a substantial number of contextual and

organizational characteristics that help determine collaborative success. This paper focuses on five such characteristics that might be particularly interesting to a broad audience.

798 (DOE/EIA–0226(92/09)) **Electric power monthly, September 1992.** USDOE Energy Information Administration, Washington, DC (United States). Office of Coal, Nuclear, Electric and Alternate Fuels. 16 Sep 1992. 188p. Sponsored by USDOE, Washington, DC (United States). Order Number DE93000833. Source: OSTI; NTIS; GPO; GPO Dep.

The Electric Power Monthly is prepared by the Survey Management Division; Office of Coal, Nuclear, Electric and Alternate Fuels, Energy Information Administration (EIA), Department of Energy. This publication provides monthly statistics at the national, Census division, and State levels for net generation, fuel consumption, fuel stocks, quantity and quality of fuel, cost of fuel, electricity sales, revenue, and average revenue per kilowatthour of electricity sold. Data on net generation, fuel consumption, fuel stocks, quantity and cost of fuel are also displayed for the North American Electric Reliability Council (NERC) regions. Additionally, statistics by company and plant are published in the EPM on capability of new plants, net generation, fuel consumption, fuel stocks, quantity and quality of fuel, and cost of fuel.

799 (DOE/EIA–0376(90)) **State energy price and expenditure report 1990.** USDOE Energy Information Administration, Washington, DC (United States). Office of Energy Markets and End Use. 11 Sep 1992. 282p. Sponsored by USDOE, Washington, DC (United States). Order Number DE92041347. Source: OSTI; NTIS; INIS; GPO; GPO Dep.

The State Energy Price and Expenditure Report (SEPER) presents energy price and expenditure estimates individually for the 50 States and the District of Columbia and in aggregate for the United States. The estimates are provided by energy source and economic sector. This report is an update of the State Energy Price and Expenditure Report 1989 published in September 1991. Energy price and expenditure estimates are published for the years 1970, 1975, 1980, and 1985 through 1990. Documentation follows the tables and describes how the price estimates are developed, including sources of data, methods of estimation, and conversion factors applied.

800 (SRC–7523-R6) **Guidebook for Farmstead Demand-Side Management (DSM) program design: [Final report].** Rose, M.; Camera, R.K. Synergic Resources Corp., Bala-Cynwyd, PA (United States). 21 Feb 1992. 115p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG01-89CE28309. Order Number DE93000895. Source: OSTI; NTIS; GPO Dep.

The acceptance and growth of Demand-Side Management (DSM) continues to increase in the US. According to latest estimates, total expenditures on electric utility DSM programs now exceed $1.2 billion annually, with these investments ranging from 1 to 5 percent of a utility's gross revenues. In addition, due to increasing environmental concerns and the high cost of new capacity, these expenditure levels are expected to increase. While the vast majority of these DSM programs are directed at the more traditional residential, commercial and industrial market sectors, significant opportunities still exist. One market segment that has not been the focus of attention but a critical sector from an economic development perspective for marry utilities – is the agricultural and farmstead market. Although the total number of farms in the United States decreased by approximately 5 percent between 1985 and 1989, the land dedicated to farming still accounts for over 995 million acres. Furthermore, the total value of farm output in the United States has been steadily increasing since 1986. The limited penetration of energy efficiency measures in farmsteads provides an excellent opportunity for utilities to expand their DSM programming efforts to capture this "non-traditional" market segment, and at the same time assist farms in increasing their efficiency and competitiveness. In marry states, and, in particular New York State, agriculture plays a major economic role. The importance of farms not only from a utility perspective but also from a state and federal perspective cannot be overstated. As such, utilities are in a unique position to facilitate farmstead DSM technology investments in an effort to benefit the farmer (and his profitability), the utility, the state and the country. This guidebook is designed to provide the framework for agricultural demand planning, including market assessment, technology assessment, market penetration analysis and program design.

Part 3 of the proceedings contains a report on the conference and 10 contributions, out of which 2 have been inputted in INIS: one deals with the economic problems of wind-, solar- and oil-driven water pumps, the other deals with the decrease in sunshine brought about by the operation of Czechoslovak nuclear power plants. (M.D.). 4 tabs., 10 figs., 10 refs.

803 (NEDO-P–9101) **Present status and future trend of cooperation in new energy (the U.S.).** New Energy and Industrial Technology Development Organization, Tokyo (Japan). Mar 1992. 61p. (In Japanese). Sponsored by New Energy and Industrial Technology Development Organization, Tokyo (Japan). Order Number DE93723959. Source: OSTI; NTIS.

Information is collected on the US policy and trend of development and introduction of petroleum substitution energy to promote development and introduction of petroleum substitution energy in Japan effectively and efficiently. The recent history of alternative energy sources tells that a promise has turned to a disillusionment. The industry is besieged by a number of negative marketing factors which have precluded short-term profitability and also have been threatening the survival itself of the companies participating in the industry. On a long-term basis, alternative energy sources might or might not be more promising than they are now. On a short-term basis, however, the market is characterized by no profits, lack of economic competitive strength and declining governmental assistance. International cooperation in alternative energy sources is not desirable for a majority of the US firms which compete in the industry. 1 fig., 6 tabs.

804 (NEDO-P–9102) **Present status and future trend of cooperation in new energy (Canada).** New Energy and Industrial Technology Development Organization, Tokyo (Japan). Mar 1992. 78p. (In Japanese). Sponsored by New Energy and Industrial Technology Development Organization, Tokyo (Japan). Order Number DE93723960. Source: OSTI; NTIS.

The paper provides information on Canada's petroleum substitution energy policy in a framework of their comprehensive energy and environment policies. In this study it is confirmed that Canada

desires to reduce the per capita energy consumption of a nation and has been making advances in the fields of energy efficiency and energy conservation. At the same time, it is clarified that they intend to decrease their oil dependence by widening utilization of natural gas and giving priority to power generation using nuclear power, hydroelectric power and other substitution fuels. Enhancing interest in the environmental problem is pointed out as the background of Canada's being pressed to increase energy efficiency and utilization of substitution energy. No signs are seen at all of a decline in the tendency to support environmental conservation. As a result, it is also pointed out that Canadian government organizations for scientific technology should be assured of larger independence and freedom, so that they can allocate and use their manpower and resources more effectively. 16 tabs.

805 (NEDO-P–9103) **United Kingdom's policy on energy alternatives to oil and international cooperation.** New Energy and Industrial Technology Development Organization, Tokyo (Japan). Mar 1992. 50p. (In Japanese). Sponsored by New Energy and Industrial Technology Development Organization, Tokyo (Japan). Order Number DE93723961. Source: OSTI; NTIS.

The United Kingdom, which has rich oil resource and produces petroleum and natural gas, develops and introduces petroleum substitution energy to consider the global environmental problem, particularly to reduce greenhouse effect gases, rather than to secure resources. In 1990 the government announced their principle policy that CO_2 emission in 2005 should be as it was in 1990, so that the target was set that a capacity of commercial power generation using petroleum substitution energy sources should be 1000MW by 2000. In the same year they enacted the Environmental Protection Act and subsidized environmental protection programs. They also announced that by 2005 they would supply 20% of UK's total electricity output with commercially viable renewable energy by introducing the Non-Fossil Fuel Obligation as legal and administrative measures to introduce petroleum substitution energy to the market. The Department of Energy has given priority to petroleum substitution energy such as photovoltaic power generation, bioregeneration and anaerobic digestion of wastes and wind power energy, and has promoted the research and development. 22 refs., 8 figs., 8 tabs.

806 (NEI-DK–968) **Municipal planning for windmills: Methods, administrative basis, guidelines. Example: Thisted municipality. Plan for wind turbines in Thisted kommune. Working note.** Nellemann Raadgivende Ingenioerer og Planlaeggere A/S, Aarhus (Denmark). Jun 1992 60p. (In Danish). Order Number DE93721411. Source: OSTI; NTIS.

Prepared for Energistyrelsen and Planstyrelsen.

Methods and processes for working out a proposal for a plan for wind turbines in Thisted municipality in Denmark are described. 100 wind turbines are already set up, and it is planned to erect 50 more in the municipality. The discussion concerns the variation in wind strength throughout this comparatively large area, the demands of the existing regional plans, the consideration of the interests of prospective neighbours of the wind turbines and following demands for environmental protection, in addition to the locations of existing wind turbines and proposed siting of the new ones. The administration of the actual planning process is described in detail. (AB).

807 (NEI-DK–971) **Renewable energy technologies: Research, technological development, enterprises 1992.** Moeller Andersen, H. (ed.). Energistyrelsen, Copenhagen (Denmark). 1992 47p. Order Number DE93721467. Source: OSTI; NTIS.

Renewable energy technologies have developed at great speed in Denmark since the energy crisis in the 1970s. Danish wind turbines are already well known internationally and the renewable energy sector as a whole is now an important growth industry in the country. This has been achieved with the aid of a comprehensive research and development programme, involving financial support schemes, public testing and certification, and technology demonstrations. The Danish government has introduced a number of measures designed to bring about significant reductions in energy consumption and emissions. The publication reviews various aspects of renewable energy technologies with particular emphasis on recent developments, and presents key organizations, institutes and public bodies. (AB).

808 (NEI-FI–168, pp. 19-26) **The demonstration programme for wind energy in Norway.** Grorud, C. (Norwegian Water Resources (Norway)). Finnish Wind Power Association, Espoo (Finland). 1990. (CONF-9010521–: FINNWIND'90: conference on wind power in Finland, Pori (Finland), 19-20 Oct 1990). In *Finnwind'90: Presentations.* 120p. Order Number DE93721624. Source: OSTI; NTIS.

A demonstration programme for wind energy has been initiated. The aim is to gain experience and to disseminate information about wind energy through installation and operation of wind turbines. Feasible application in the electricity system has been identified, and proposals for installation of about 20 wind turbines have been received. One project has been realized at the island Hammaroey in Moere og Romsdal.

Order Number DE93721624. Source: OSTI; NTIS.

Total energy consumption in Finland per capita is one of the highest the world. The rate of total energy growth has been cut to one half of the GDP growth due to active energy policy. Energy saving programmes have been most successful in thermal energy consumption, like space heating. At the same time electricity demand has been growing, and seems to increase also in future. The electricity consumption in Finland last year was about 50 TWh. It is based on nuclear power, hydro power and fossil fuels. Combined heat and power generation is commonly used, about 1/2 of the total supply. Traditionally, wood and peat have been the important renewable, indigenous energy sources in Finland, and hydro power of course. Wind power, is as new possibility in the national power supply. Wind energy has been researched for some time in Finland. In 1988 when national energy research policy was revised, wind energy R and D was included in the NEMO research programme on advanced energy systems.

In Korsnaes, a commune on the Finnish west coast there have been plans to build a wind power plant for a couple of years. According to the latest plans a 1 MW windfarm, consisting of five 200 units, will be built. Other possible combinations to obtain the desired size are not excluded yet. The project is planned to be started in 1991, provided that the law about relief from purchase tax on plants for energy production will be accepted by parliament (in October 1991). According to the same law wind produced energy will still be taxable. Today the rate of the sales tax is 17 %.

Machine Design of Power Plants). Finnish Wind Power Association, Espoo (Finland). 1990. (CONF-9010521–: FINNWIND'90: conference on wind power in Finland, Pori (Finland), 19-20 Oct 1990). In *Finnwind'90: Presentations*. 120p. Order Number DE93721624. Source: OSTI; NTIS.

The integration of large amounts of wind power into the Finnish power system has been studied on national level with the ARTS-model, which is able to describe time-dependent production technologies. The model is based on probabilistic production costing using the Equivalent Energy Function -method with multistate probability distributions of wind power, which depend on the period of the year. The temperature dependence of consumption and wind power production are also included in the model. The long term value of wind power in the Finnish power supply system is according to the calculations 0,18 FIM/kWh, which is about 0,1 FIM/kWh less than the production cost of wind power in best places today.

816 (ANL/CP–76058) **Computer simulation of an advanced combustor for clean coal technology.** Chang, S.L.; Lottes, S.A. Argonne National Lab., IL (United States). [1992]. 13p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-9209160–18: International symposium on energy, environment and information management, Argonne, IL (United States), 15-18 Sep 1992). Order Number DE92040742. Source: OSTI; NTIS; GPO Dep.

Magnetohydrodynamic (MHD) power generation is a clean coal technology because of its higher thermal efficiency and lower pollutant emission. Argonne National Laboratory used a comprehensive integral combustion computer code to aid the development of a TRW's second stage combustor for MHD power generation. The integral combustion code is a computer code for two-phase, two-dimensional, steady state, turbulent, and reacting flows, based on mass, momentum, and energy conservation laws for multiple gas species and solid particles of variable sizes. In the MHD second stage combustor, opposed jets of oxidizer are injected into a confined cross-stream coal gas flow laden with seed particles. The performance of the downstream MHD power generation channel depends mainly on the degree and the uniformity of gas ionization, which, in turn, depends on the uniformity of temperature and seed vapor distributions leaving the combustor. The simulation provides in-depth information of flow, combustion, and heat transfer patterns in the combustor, which is used to predict ranges of combustor operating conditions for optimum performance of the MHD system.

817 (ANL/CP–77194) **MHD seawater thruster performance: A comparison of predictions with experimental results from a two Tesla test facility.** Picologlou, B.F. (Argonne National Lab., IL (United States)); Doss, E.D.; Geyer, H.K.; Sikes, W.C.; Ranellone, R.F. Argonne National Lab., IL (United States). [1992]. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-921038–5: 11. international conference on magnetohydrodynamics (MHD) electrical power generation, Beijing (China), 12-16 Oct 1992). Order Number DE92041106. Source: OSTI; NTIS; GPO Dep.

A two Tesla test facility was designed, built, and operated to investigate the performance of magnetohydrodynamic (MHD) seawater thrusters. The results of this investigation are used to validate a design oriented MHD thruster performance computer code. The thruster performance code consists of a one-dimensional MHD hydrodynamic model coupled to a two-dimensional electrical model. The code includes major loss mechanisms affecting the performance of the thruster. Among these losses are the joule dissipation losses, frictional losses, electrical end losses, and single electrode potential losses. The facility test loop, its components, and their design are presented in detail. Additionally, the test matrix and its rationale are discussed. Representative experimental results of the test program are presented, and are compared to pretest computer model predictions. Good agreement between predicted and measured data has served to validate the thruster performance computer models.

818 (DOE/ET/10815–195) **Fate of chlorine-containing species in coal-fired MHD system.** Wang, S.H.; Holt, J.K.; Sheth, A.C. Tennessee Univ., Tullahoma, TN (United States). Space Inst. [1992]. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-79ET10815. (CONF-921037–5: 9. annual international Pittsburgh coal conference, Pittsburgh, PA (United States), 12-16 Oct 1992). Order Number DE93000786. Source: OSTI; NTIS; GPO Dep.

From pilot plant test measurements, equilibrium calculations and bench scale experiments, the fate of various chlorin-containing species in a coal-fired MHD system has been determined. Chlorine generally occurs in fuel in a form that is easily decomposed or vaporized during combustion. According to a CONOCO bulletin, some Illinois coals contain chlorine concentrations up to 0.65% and many US coals exhibit chlorine contents varying from 0.01% to about 0.5%. Depending upon the grade of the seed material,its chlorine content as KC1 or NaCl can vary from 0.05% to 1.5%. Potassium salts used as seed material in the MHD system are recovered and recycled for economic and environmental reasons. However, multiple recycling results in a potential problem of coal-derived chloride build-up in the MHD system. If such build-up of chlorine-containing species is not controlled below an acceptable level, potentially serious problems may be faced in the entire MHD system. - Also under the new Clean Air Act, emission of HCl (hydrochloric acid) gas/aerosol from a continuous source will have to be brought down from 17 to less than 10 tons/year.

819 (DOE/ID/12735–T24) **Magnetohydrodynamic projects at the CDIF: Quarterly technical progress report, April 1–June 30, 1992.** MSE, Inc., Butte, MT (United States). [1992]. 13p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-88ID12735. Order Number DE93001854. Source: OSTI; NTIS; GPO Dep.

This quarterly technical progress report presents the tasks accomplished at the Component Development and Integration Facility (CDIF) during the third quarter of FY92. Areas of technical progress this quarter included: Coal system development; seed system development; test train/A-Bay modifications; channel power dissipation and distribution system development; and integrated topping cycle current consolidators.

820 (DOE/PC/79672–T3) **MHD seed recovery/regeneration: Phase 2, Technical progress report, quarter ending May 29, 1992.** TRW Space and Technology Group, Redondo

Beach, CA (United States). Applied Technology Div. [1992]. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-87PC79672. Order Number DE93000904. Source: OSTI; NTIS; GPO Dep.

Task 1 calls for the design, procurement, construction, and installation of the Seed Regeneration Proof-of-Concept Facility (SRPF) (Figure 1) that will produce tonnage quantities of recyclable potassium formate seed at a design rate of 250 lb/hr for testing in the channel at the CDIF while collecting data that will be used to upgrade the design of a 300 MW_t system. Approximately 12 tons of KCOOH (dry basis) as 70–75 wt% solution have been produced. The front end of the plant (potassium sulfate reaction and solids separation/washing units) was operated for five days in March. Most of the operations were conducted at a spent seed feed rate of 250 pounds/hour. A total of ~8,500 gallons of dilute KCOOH solution was generated containing approximately 2.6 tons of potassium formate (dry basis). The average KCOOH content of this solution was -7 wt%. The design KCOOH solution concentration for the front end of the plant is 8.5 wt%. The evaporation unit was operated or a total six days during March. Approximately 2.5 tons of potassium formate (dry basis) were processed through the evaporator and concentrated to >70 wt%.

821 (DOE/PC/90274–T19) **MHD Integrated Topping Cycle Project: Eighteenth quarterly technical progress report, November 1, 1991–January 31, 1992.** TRW Space and Technology Group, Redondo Beach, CA (United States). Applied Technology Div. Jul 1992. 71p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-87PC90274. (MHD-ITC–92-168). Order Number DE92041285. Source: OSTI; NTIS; GPO Dep.

This eighteenth quarterly technical progress report of the MHD Integrated Topping cycle Project presents the accomplishments during the period November 1, 1991 to January 31, 1992. The precombustor is fully assembled. Manufacturing of all slagging stage components has been completed. All cooling panels were welded in place and the panel/shell gap was filled with RTV. Final combustor assembly is in progress. The low pressure cooling subsystem (LPCS) was delivered to the CDIF. Second stage brazing issues were resolved. The construction of the two anode power cabinets was completed.

822 (DOE/PC/90274–T20) **MHD Integrated Topping Cycle Project: Seventeenth quarterly technical progress report, August 1, 1991–October 31, 1991.** TRW Space and Technology Group, Redondo Beach, CA (United States). Applied Technology Div. Jul 1992. 83p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-87PC90274. (MHD-ITC–92-126). Order Number DE92041284. Source: OSTI; NTIS; GPO Dep.

This seventeenth quarterly technical progress report of the MHD Integrated Topping Cycle Project presents the accomplishments during the period August 1, 1991 to October 31, 1991. Manufacturing of the prototypical combustor pressure shell has been completed including leak, proof, and assembly fit checking. Manufacturing of forty-five cooling panels was also completed including leak, proof, and flow testing. All precombustor internal components (combustion can baffle and swirl box) were received and checked, and integration of the components was initiated. A decision was made regarding the primary and backup designs for the 1A4 channel. The assembly of the channel related prototypical hardware continued. The cathode wall electrical wiring is now complete. The mechanical design of the diffuser has been completed.

3005 Fuel Cells

823 (DOE/MC/22194–3001) **Development of metal-coated ceramic anodes for molten carbonate fuel cells: Final report.** Khandkar, A.C.; Elangovan, S.; Marianowski, L.G. Ceramatec, Inc., Salt Lake City, UT (United States). Mar 1990. 106p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC21-85MC22194. Order Number DE91002082. Source: OSTI; NTIS; GPO Dep.

This report documents the developmental efforts on metal coating of various ceramic substrates ($LiAlO_2$, $SrTiO_3$, and $LiFeO_2$) and the critical issues associated with fabricating anodes using metal-coated $LiAlO_2$ substrates. Electroless Ni and Cu coating technology was developed to achieve complete metal coverage on $LiAlO_2$ powder substrates. Metal coated $SrTiO_3$ powders were fabricated into anodes by a process identical to that reported in the GE literature. Microstructural examination revealed that the grains of the ceramic had fused together, with the metal having dewetted from the surface of the ceramic. Alternate substrates that might allow for better wetting of the metal on the ceramic such as $LiFeO_2$ and Li_2MnO_3 were identified. Cu/Ni-coated (50:50 mol ratio, 50 w/o metal loading) $LiFeO_2$ anodes were optimized to meet the MCFC anode specifications. Metal-coated gamma-$LiAlO_2$ substrates were also developed. By using suitable chemical surface modification methods, the gamma-$UAlO_2$ substrate surface may be modified to allow a stable metal coated anode to be fabricated. Creep testing of the metal coated ceramic anodes were conducted at IGT. It was determined that the predominant creep mechanism is due to particle rearrangement. The anode porosity, and mean pore size had significant effect on the creep of the anode. Lower porosity and pore size consistent with performance criteria are desired to reduce creep. Lower metal loading with uniformity of coverage will result in lower creep behavior of the anode. Of the two substrates evaluated, $LiFeO_2$ in general exhibited lower creep which was attributed to superior metal adhesion.

824 (DOE/MC/23270–3105) **Molten carbonate fuel cell technology improvement: Final report.** International Fuel Cells Corp., South Windsor, CT (United States). Jun 1991. 180p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC21-87MC23270. (FCR–11486). Order Number DE92001300. Source: OSTI; NTIS; GPO Dep.

This report summarizes the work performed under Department of Energy Contract DEAC21-87MC23270, "Molten Carbonate Fuel Cell Technology Improvement." This work was conducted over a three year period and consisted of three major efforts. The first major effort was the power plant system study which reviewed the competitive requirements for a coal gasifier/molten carbonate fuel cell power plant, produced a conceptual design of a CG/MCFC, and defined the technology development requirements. This effort is discussed in Section 1 of the report. The second major effort involved the design and development of a new MCFC cell configuration which reduced the material content of the cell to a level competitive with competing power plants, simplified the cell configuration to make the components more manufacturable and adaptable to continuous low cost processing techniques, and introduced new-low-pressure drop flow fields for both reactant gases. The new flow fields permitted the incorporation of recirculation systems in both reactant gas systems, permitting simplified cooling techniques and the ability to operate on both natural gas and a wide variety of gasifier fuels. This cell technology improvement is discussed in Section 2. The third major effort involved the scaleup of the new cell configuration to the full-area, 8-sq-ft size and resulted in components used for a 25-kW, 20-cell stack verification test. The verification test was completed with a run of 2200 hours, exceeding the goal of 2000 hours and verifying the new cell design. TWs test, in turn, provided the confidence to proceed to a 100-kW demonstration which is the goal of the subsequent DOE program. The scaleup and stack verification tests are discussed in Sections 3, 4, 5, and 6 of this report.

825 (DOE/MC/24223–3103) **Gas cooled fuel cell systems technology development: Final report.** Westinghouse Electric Corp., Pittsburgh, PA (United States). Nuclear and Advanced Technology Div.; Energy Research Corp., Danbury, CT (United States). Mar 1992. 193p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC21-82MC24223. Order Number DE92001298. Source: OSTI; NTIS; GPO Dep.

This report documents in detail the work performed by Westinghouse Electric Corporation and the Energy Research Corporation during the fourth phase of a planned multiphase program to

develop a Phosphoric Acid Fuel Cell (PAFC) for electric utility or industrial power plant applications. Results of this effort include: (1) development of a baseline rolled electrode technology; (2) advancement of fuel cell technology through innovative improvements in the areas of acid management, catalyst selection, electrode and plate materials and processes, components designs, and quality assurance programs; (3) demonstration of improved fuel cell and stack performance and endurance; (4) successful scaleup of cell and stack design features into fun height 100 kill stacks; and (5) demonstration of combining stacks into a 400 kill module that will be the building block for power plants, including the development of testing facilities and operating procedures applicable to plant operations.

826 (DOE/MC/25009–3123) **Effects of coal-derived trace species on performance of molten carbonate fuel cells: Final report.** Energy Research Corp., Danbury, CT (United States). May 1992. 203p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC21-88MC25009. Order Number DE93000203. Source: OSTI; NTIS; GPO Dep.

The Carbonate Fuel Cell is a very promising option for highly efficient generation of electricity from many fuels. If coal-gas is to be used, the interactions of coal-derived impurities on various fuel cell components need to be understood. Thus the effects on Carbonate Fuel Cell performance due to ten different coal-derived contaminants viz., NH_3, H_2S, $HC\ell$, H_2Se, AsH_3, Zn, Pb, Cd, Sn, and Hg, have been studied at Energy Research Corporation. Both experimental and theoretical evaluations were performed, which have led to mechanistic insights and initial estimation of qualitative tolerance levels for each species individually and in combination with other species. The focus of this study was to investigate possible coal-gas contaminant effects on the anode side of the Carbonate Fuel Cell, using both out-of-cell thermogravimetric analysis by isothermal TGA, and fuel cell testing in bench-scale cells. Separate experiments detailing performance decay in these cells with high levels of ammonia contamination (1 vol %) and with trace levels of Cd, Hg, and Sn, have indicated that, on the whole, these elements do not affect carbonate fuel cell performance. However, some performance decay may result when a number of the other six species are present, singly or simultaneously, as contaminants in fuel gas. In all cases, tolerance levels have been estimated for each of the 10 species and preliminary models have been developed for six of them. At this stage the models are limited to isothermal, bench-scale (300 cm^2 size) single cells. The information obtained is expected to assist in the development of coal-gas cleanup systems, while the contaminant performance effects data will provide useful basic information for modeling fuel cell endurance in conjunction with integrated gasifier/fuel-cell systems (IGFC).

827 (DOE/MC/25026–3106) **Development of a coal-fueled Internal Manifold Heat Exchanger (IMHEX®) molten carbonate fuel cell: Volumes 1–6, Final report.** Institute of Gas Technology, Chicago, IL (United States). Sep 1991. 402p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC21-88MC25026. Order Number DE92012451. Source: OSTI; NTIS; GPO Dep.

The design of a CGMCFC electric generation plant that will provide a cost of eletricity (COE) which is lower than that of current electric generation technologies and which is competitive with other long-range electric generating systems is presented. This effort is based upon the Internal Manifold Heat Exchanger (IMHEX) technology as developed by the Institute of Gas Technology (IGT). The project was executed by selecting economic and performance objectives for alternative plant arrangements while considering process constraints identified during IMHEX fuel cell development activities at IGT. The four major subsystems of a coal-based MCFC power plant are coal gasification, gas purification, fuel cell power generation and the bottoming cycle. The design and method of operation of each subsystem can be varied, and, depending upon design choices, can have major impact on both the design of other subsystems and the resulting cost of electricity. The challenge of this project was to select, from a range of design parameters, those operating conditions that result in a preferred plant design. Computer modelling was thus used to perform sensitivity analyses of as many system variables as program resources and schedules would permit. In any systems analysis, it is imperative that the evaluation methodology be verifiable and comparable. The TAG Class I develops comparable (if imprecise) data on performance and costs for the alternative cases being studied. It identifies, from a range of options, those which merit more exacting scrutiny to be undertaken at the second level, TAG class II analysis.

828 (DOE/MC/27394–92/C0047) **Simulated coal gas MCFC power plant system verification.** Benjamin, T.G.; Camara, E.H.; Laurens, R.; Marianowski, L.G. M-C Power Corp., Burr Ridge, IL (United States). [1992]. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC21-90MC27394. (CONF-920748–22: US Department of Energy contractors review meeting on fuel cells, Morgantown, WV (United States), 14-15 Jul 1992). Order Number DE92040939. Source: OSTI; NTIS; GPO Dep.

The overall program objective is the demonstration of a full-scale, full-height IMHEX ® molten carbonate fuel cell stack in a 250 kW dual-fuel power plant test on natural gas and simulated coal gas. Issues impeding development of manufacturing and testing facilities will be addressed in support of MCFC stack research and power plant development. Issues will be identified and resolved in engineering, manufacturing, assembling, cost, performance, and endurance of the stack repeat and non-repeat components. The program is being executed by M-C Power (MCP) and several major subcontractors.

829 (LBL–32577) **Solid-polymer-electrolyte fuel cells.** Fuller, T.F. Lawrence Berkeley Lab., CA (United States). Jul 1992. 248p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00098. Order Number DE92041204. Source: OSTI; NTIS; GPO Dep.

A transport model for polymer electrolytes is presented, based on concentrated solution theory and irreversible thermodynamics. Thermodynamic driving forces are developed, transport properties are identified and experiments devised. Transport number of water in Nafion 117 membrane is determined using a concentration cell. It is 1.4 for a membrane equilibrated with saturated water vapor at 25°C, decreases slowly as the membrane is dehydrated, and falls sharply toward zero as the water content approaches zero. The relation between transference number, transport number, and electroosmotic drag coefficient is presented, and their relevance to water-management is discussed. A mathematical model of transport in a solid-polymer-electrolyte fuel cell is presented. A two-dimensional membrane-electrode assembly is considered. Water management, thermal management, and utilization of fuel are examined in detail. The membrane separators of these fuel cells require sorbed water to maintain conductivity; therefore it is necessary to manage the water content in membranes to ensure efficient operation. Water and thermal management are interrelated. Rate of heat removal is shown to be a critical parameter in the operation of these fuel cells. Current-voltage curves are presented for operation on air and reformed methanol. Equations for convective diffusion to a rotating disk are solved numerically for a consolute point between the bulk concentration and the surface. A singular-perturbation expansion is presented for the condition where the bulk concentration is nearly equal to the consolute-point composition. Results are compared to Levich's solution and analysis.

830 (NEDO-P–9118) **Survey on polymer electrolyte fuel cell for its research and development.** New Energy and Industrial Technology Development Organization, Tokyo (Japan). Mar 1992. 100p. (In Japanese). Sponsored by New Energy and Industrial Technology Development Organization, Tokyo (Japan). Order Number DE93723968. Source: OSTI; NTIS.

Fundamental studies are made on development of polymer electrolyte fuel cells (PEFC). PEFC is a low-temperature operation type, of which exhaust heat is obtained as hot water, and is suitable for small-size dispersed distribution. It is high in energy density, and its cell voltage over 0.8V and conversion efficiency higher than that of phosphoric acid fuel cells are obtained. When it is used for cogeneration as an onsite type, hot water around 70 centigrade can be recovered. PEFC is used as a transferable power source for the electric car which is low air-pollutant, and petroleum substitution methanol can be used as its fuel. PEFC works at a normal temperature and is quick to start up and becomes high in energy density. A PEFC-electric battery hybrid car is

now under development in the U.S. and Canada. PEFC is expected also as a portable power source. Studies are made on improvement of the fuel reforming method and the use of perfluorinated ion exchange membranes for fuel cell. Further studies are made on the cell body and the constructure of the fuel cell system as developmental subjects. 63 refs., 65 figs., 28 tabs.

32 ENERGY CONSERVATION, CONSUMPTION, AND UTILIZATION

3201 Buildings

831 (ANL/CP–77435) **An analysis of heating and cooling conservation features in commercial buildings.** Sutherland, R.J. Argonne National Lab., IL (United States). [1990]. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-900833–18: 6. American Council for an Energy-Efficient Economy (ACEEE) summer study on energy efficiency in buildings, Pacific Grove, CA (United States), 26 Aug - 1 sep 1990). Order Number DE93000606. Source: OSTI; NTIS; GPO Dep.

One purpose of this study is to estimate the relationship in commercial buildings between conservation investments, fuel prices, building occupancy and building characteristics for new buildings and for existing buildings. The database is a nationwide survey of energy in commercial buildings conducted by the Energy Information Administration (EIA) in 1906. Some simple cross-tabulations indicate that conservation measures vary with building size, building age, and fuel used for building heating. Regression estimates of a conservation model indicate that the number of conservation model indicate that the number of conservation features installed during construction is a positive function of the price of the heating fuel at the time of construction. Subsequent additions of conservation features are positively correlated with increases in heating fuel prices. Given the EIA projection of relatively stable future energy prices, the number of retrofits may not increase significantly. Also, energy efficiency in new buildings may not continue to increase relative to current new buildings. If fuel prices affect consumption via initial conservation investments, current fuel prices, marginal or average, are not the appropriate specification. The fuel price regression results indicate that conservation investments in new buildings are responsive to market signals. Retrofits are less responsive to market signals. The number of conservation features in a building is not statistically related to the type of occupancy (owner versus renter), which implies that conservation strategies are not impeded by the renting or leasing of buildings.

832 (BNL–52341) **Proceedings of the 1992 DOE-Industry thermal distribution conference.** Andrews, J.W. (ed.). Brookhaven National Lab., Upton, NY (United States). Jun 1992. 147p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016. (CONF-9203193–: 1992 DOE-industry thermal distribution conference, Washington, DC (United States), 30-31 Mar 1992). Order Number DE93002116. Source: OSTI; NTIS; GPO Dep.

The subject of the conference was thermal distribution in small buildings. Thermal distribution systems are the ductwork, piping, or other means used to transport heat or cooling effect from the equipment in which the heat or cooling is produced to the building spaces in which it is used. The small buildings category is defined to include single-family residential and multifamily and commercial buildings with less than 10,000 ft^2 floor area. The 1992 DOE-Industry Thermal Distribution Conference was conceived as the beginning of a process of information transfer between the DOE and the industries having a stake in thermal distribution systems, whereby the DOE can make the industry aware of its thinking and planned directions early enough for changes to be made, and whereby the industries represented can provide this input to the DOE on a timely and informed basis. In accordance with this, the objectives of the Conference were: To present–to a representative group of researchers and industry representative–the current industry thinking and DOE's current directions for research in small-building thermal distribution. To obtain from industry and the research community a critique of the DOE priorities and additional ideas concerning how DOE can best assist the industry in promoting energy conservation in thermal distribution systems.

833 (CONF-9209231–1-Draft) **Energy performance and installation considerations for retrofitted exterior masonry wall insulation: Draft.** Ternes, M.P.; Wilkes, K.E. Oak Ridge National Lab., TN (United States). [1992]. 17p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From International symposium on exterior insulation and finish systems; Arlington, VA (United States); 21-24 Sep 1992. Order Number DE92041256. Source: OSTI; NTIS; GPO Dep.

A field test involving eight single-family houses was performed during the summer of 1991 in Scottsdale, Arizona to evaluate the potential of reducing air-conditioning electricity consumption and demand by insulating their exterior masonry walls. The installation technique. Total per house costs to perform the installations ranged from $3610 to $4550. The average annual savings was estimated to be 491 kWh, or 9% of pre-retrofit consumption. Peak demands with and without insulation on the hottest day of an average weather year for Phoenix were estimated to be 4.26 and 3.61 kill, for a demand reduction of 0.65 kW (15%). We conclude that inclusion of exterior masonry wall insulation in conservation programs aimed at reducing air-conditioning electricity consumption and peak demand should be pursued in hot, dry climates.

834 (CONF-921203–1) **Energy and global warming impacts of CFC alternative technologies for foam building insulations.** Fischer, S.K.; Fairchild, P.D.; Hughes, P.J. Oak Ridge National Lab., TN (United States). [1992]. 15p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From Thermal performance of the exterior envelopes of buildings; Clearwater, FL (United States); 7-10 Dec 1992. Order Number DE92019477. Source: OSTI; NTIS; INIS; GPO Dep.

Chlorofluorocarbons (CFCS) have been used as blowing agents in foam insulation, as the working fluids in cooling and refrigeration equipment, and as solvents in general and precision cleaning applications since their introduction in the 1930s. The number of applications and volumes of CFCs used grew at a tremendous pace during the 1960s and 1970s, but in the mid-1980s it was confirmed that these extremely useful chemicals contribute to the destruction of stratospheric zone and that they are the primary cause of the CFCs have also been found to be second only to carbon dioxide as a factor causing increased greenhouse warming. These chemicals are being phased out of use rapidly to protect the ozone layer and it is very important that the replacements for CFCs do not result in a net increase in global warming by introducing less efficient processes that lead to higher energy use and increased carbon dioxide emissions. A study was conducted to identify those alternative chemicals and technologies that could replace CFCs in energy related applications before the year 2000, and to assess the total potential impact of those alternatives on global warming. The analysis for this project included an estimate of the direct effects from the release of blowing agents, refrigerants, and solvents into the atmosphere and the indirect effects of carbon dioxide emissions resulting from energy use for commercial and residential building insulation, household and commercial refrigeration, building and automobile air conditioning, and general metal and electronics solvent cleaning. This paper focuses on those aspects of the study relevant to building insulation. In general the hydrofluorocarbon (HFC) and hydrochlorofluorocarbon alternatives for CFCs lead to large and sometimes dramatic reductions in total equivalent warming impact, lifetime equivalent $C0_2$ emissions (TEWI). Most of the reductions result from decreased direct effects without significant changes in energy use.

835 (CONF-921203–2) **System effects on the thermal aging of experimental polyisocyanurate roof insulation foamed with an alternative blowing agent.** Desjarlais, A.O.; Christian, J.E; Linkous, R.L. Oak Ridge National Lab., TN (United States). [1992]. 28p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From Thermal performance of the exterior envelopes of buildings; Clearwater, FL

(United States); 7-10 Dec 1992. Order Number DE92019967. Source: OSTI; NTIS; GPO Dep.

Experimental polyisocyanurate foam roof insulation with 0.6mm thick permeable black facers blown with HCFC-141b installed on test roofs at the Oak Ridge National Laboratory for almost three years show various degrees of aging. Four roof systems are being monitored to determine the effect of system type on board aging. The four systems are comprised of a dry stack of insulation boards covered, respectively, by a loose-laid single ply white membrane, a loose-laid single ply black membrane, a built-up roof (BUR), and a fully adhered ethylene propylene diene monomer (EPDM) membrane. A comparison to periodic laboratory testing of the insulation boards is also included. The data analysis program, PROPOR, has been used to estimate the thermal properties of the polyisocyanurate foam insulation, to gain insight into the data and the pure conduction model used by PROPOR through sequential value and residual analyses, and to estimate precision of the results with confidence intervals. These confidence intervals are then used to determine if the differences noted due to aging of the insulation boards contained within these systems are statistically significant.

836 (CONF-921203–3) **Thermal performance of fiberglass and cellulose attic insulations.** Wilkes, K.E.; Childs, P.W. Oak Ridge National Lab., TN (United States). [1992]. 30p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From Thermal performance of the exterior envelopes of buildings; Clearwater, FL (United States); 7-10 Dec 1992. Order Number DE92040714. Source: OSTI; NTIS; GPO Dep.

A series of experiments has been completed on the thermal performance of fiberglass and cellulose attic insulations under winter conditions using an attic test module in a guarded hot box facility. Experiments with one type of loose-fill fiberglass insulation showed that the thermal resistance at large temperature differences (70 to 76°F) was about 35 to 50% less than at small temperature differences. The additional heat flow, attributed to natural convection, was effectively eliminated by applying a covering of fiberglass batts or a combination of a polyethylene film and fiberglass blankets. No significant convection was found either with fiberglass batts or with one type of loose-fill cellulose. Using the experimental data along with an attic model, the additional energy costs due to convection in the coldest climate investigated were estimated to be $0.025/ft^{2}yr to $0.028/ft^{2}yr at the R-19 level and $0.014/ft^{2}yr at the R-38 level. For the same conditions, annual energy savings due to upgrading insulation from the R-19 to the R-38 level were estimated to be $0.046/ft^{2}yr to $0.070/ft^{2}yr.

837 (CONF-930118–2) **Laboratory evaluation of an ozone-safe nonazeotropic refrigerant mixture in a Lorenz-Meutzner refrigerator freezer design.** Sand, J.R.; Vineyard, E.A.; Baxter, V.D. Oak Ridge National Lab., TN (United States). [1992]. 32p. Sponsored by USDOE, Washington, DC (United States); Environmental Protection Agency, Washington, DC (United States). DOE Contract AC05-84OR21400. From Winter meeting of the American Society of Heating, Refrigeration and Air Conditioning Engineers; Chicago, IL (United States); 23-27 Jan 1993. Order Number DE92041252. Source: OSTI; NTIS; GPO Dep.

The Lorenz-Meutzner refrigerator freezer (RF) circuit has been proposed as a design which would operate with nonazcotropic refrigerant mixtures (NARMS) and significantly increase the thermodynamic efficiency of household refrigerators. Several ozone-safe and more environmentally acceptable refrigerants are known which could be blended into a NARM to replace R-12 for this domestic refrigeration application. Laboratory tests were performed on a Lorenz-Meutzner (L-M) RF using an R-32/R-124 NARM. Comparisons are made between the baseline performance of the refrigerator with R-12 before it was modified to the L-Ni design and that of the L-M circuit operating with R-12 and the NARM. Circuiting and component changes resulting from initial testing of this unit are described. Computer modeling and compressor calorimeter results for R-12 and the NARM used in the test unit are also presented. Small performance gains (≈ 3%) are seen for the NARM over R-12 in the same refrigerator freezer circuit. Modeling results and steady-state data suggest larger improvements (≈ 15%) are possible. It is felt that the larger improvements predicted from modeling and compressor calorimetry data are not being realized due to poor heat transfer and refrigerant circuiting arrangements.

838 (DEFU-TR–300) **Electricity savings from implementation of standards for the electricity consumption of refr./freezers.** Moeller, J. Danske Elvaerkers Forenings Udredningsafdeling (DEFU), Lyngby (Denmark). Apr 1992. 33p. Order Number DE93721474. Source: OSTI; NTIS.

Also published in Danish as DEFU-TR–300(DA).

An evaluation of the electricity-saving potential of introducing efficiency standards for refrigerators/freezers in the Nordic countries. It is shown that in this way user-economic savings of 25-30% can be achieved in the course of 20 years. The present Nordic consumption with regard to refrigerators in dwellings is ca. 10 TWh. In the reference development (minus efficiency standards) consumption is expected to have been reduced to 7.5 TWh by the year 2010 as a result of the continued expected increase in the energy efficiency of appliances as well as a modest rise in the number of appliances. Electricity consumption is reduced to 5.5, 5 and 4 TWh respectively in the three scenarios. In relation to today's level it is possible to halve consumption at the same time as consumer costs are reduced. Depending on the scenario selected, over a 20 yr. period, the electricity savings amount to 15-35 TWh and the value of these savings amount to between 5 and 12 billion Danish kroner (minus extra cost of efficiency increase). Estimated savings correspond to savings of 225-450 MW in generating capacity at a power plant. The analysis further shows that the effect of standards is modest if they only exclude a limited number of the existing less efficient products on the market. In order to achieve a noticeable effect, in the long term the efficiency standards must be set to a level corresponding to existing low-energy models. (AB).

839 (DEFU-TR–302) **Report on energy consumption related to water beds: Measurements from beds in use and laboratory measurements. (Phase 2 and 5).** Willumsen, O. Danske Elvaerkers Forenings Udredningsafdeling (DEFU), Lyngby (Denmark). Feb 1992. 59p. (In Danish). Order Number DE93721381. Source: OSTI; NTIS.

There are currently ca. 200.000 water beds in Denmark which use a total of 150.000.000 kWh annually, which is about 0.5% of the country's total energy consumption. It has been claimed that a low-energy bed uses about half the amount of energy (750 kWh per year) that a conventional water bed does. The report presents the measurements form the project's 2nd and 5th phase. The conclusion is that where the owners wish to save energy a conventional water bed will consume approx. 2 kWh and a low-energy bed approx. 1 kWh every 24hrs. If the temperature is lowered by 1 degree centigrade, 8-9% of energy consumption can be saved. If the plinth is insulated with plastic globules or crumpled newspapers the energy savings could be 200 kWh per year. The insulation of the wooden sides in a conventional water bed will give a saving of 100 kWh annually. An electronically regulated heating element will result in lowered energy consumption and a more constant temperature. (AB).

840 (DEFU-TR–306) **Electric power savings in the housing sector: Analysis of a 3-year experiment.** Hansen, A.K. Danske Elvaerkers Forenings Udredningsafdeling (DEFU), Lyngby (Denmark). May 1992. 82p. (In Danish). Order Number DE93721478. Source: OSTI; NTIS.

A practical 3-year experiment regarding electricity saving was carried out within the Danish housing sector in cooperation with a number of electric power companies. The publication deals with the third year of this experiment. The aim was to analyse the collected data and to carry out calculations which could be used in connection with net dimensioning, prognoses, decisions regarding tariffs etc. Data is based on the consumers' own reading of their meters, information from electricity bills and the electricity companies' meter readings. Participants also answered questionnaires. The overall aim was to investigate to what extent electricity could be saved without reducing standards of comfort, by influencing consumer habits. The means were provision of information material, consumer meter reading, visits by consultants, increased tariffs and financing arrangements. Only 43% of consumers stayed with the

experiment throughout the three years. The methods used are described and the results of the experiment are presented in detailed tables and graphs. (AB).

841 (DOE/BP–1914) **Energy management in commercial buildings.** Wisconsin Univ., Madison, WI (United States). Aug 1992. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC79-82BP31302. Order Number DE92040930. Source: OSTI; NTIS; GPO Dep.

Energy management involves more than doing a few energy conservation projects. This booklet describes how to set up an energy management program that will help you manage your energy consumption in the same professional way you manage inventory, sales, labor, and other aspects of your business. Since energy management is a relatively new area of concern, it requires conscious effort in the beginning to incorporate it into everyday practice. It is worth the effort, however, since a good energy management program can trim your energy index by 50 percent. The first section of this booklet explains energy management, how it can help your business, and what a successful program looks like. Subsequent sections provide the details of the process. Topics covered include: Energy Management is Good Business, Record Keeping, The Walk-Thru Audit, Energy Conservation Measures, Evaluating Your Program. Rising energy costs put pressure on businesses and make it harder to show a profit. The situation is not likely to improve in the foreseeable future. Hydroelectric power generation, long the mainstay of the Northwest's power system, has peaked. New sources of electricity are costly. Oil is already expensive and natural gas prices will increase as deregulation takes effect. It is reasonable to assume that annual energy costs will continue to increase at a rate several percent greater than. the rate of inflation throughout the 1980s and beyond. On the positive side, electricity rates in the Pacific Northwest are and will continue to be substantially lower than the national average. BPA also projects that, following additional wholesale rate increases through 1985, its rates should stabilize at a level roughly equal to that of 1960 based upon 1980 dollars.

842 (DOE/CE/50274–T1) **Non-inert refrigerant study for automotive applications: Final report, March–December 1990.** Dieckmann, J.T.; Bentley, J.; Varone, A. Little (Arthur D.), Inc., Cambridge, MA (United States). Nov 1991. 75p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AI01-89CE50274. Order Number DE92041034. Source: OSTI; NTIS; GPO Dep.

Alternatives to CFC-12 for automobile air conditioning were examined. The list of candidate fluids included flammable as well as non-flammable substances. HFC-134a was taken as the baseline alternative given current industry plans to convert automobile air conditioning systems to this fluid over the next several years. Three flammable (non-inert) alternative refrigerants – BFC-152a, HC-290 (propane) and HC-270 (cyclopropane) were identified. Air conditioning cycle efficiency, ozone depletion potential, and global warming impacts of these three fluids and HFC-134a were compared, with the three non-inert fluids all having higher COP and lower global warming impact. The ozone depletion potential of each of these fluids is zero. The fire safety implications of the flammable alternatives being used in otherwise conventional automobile air conditioning systems were examined in preliminary fashion. The results, which are subject to more extensive verification indicate that the additional passenger compartment fire risk would be very small, while the incidence of engine compartment fires would increase modestly. The engine compartment fire hazard could be minimized by modest design changes to reduce the occurrence of ignition sources and condenser punctures in front end collisions.

843 (DTH-LV–233) **How important is the location of the room thermostat?.** Madsen, T.L.; Schmidt, T.P.; Helk, U. Danmarks Tekniske Hoejskole, Lyngby (Denmark). Lab. for Varmeisolering. Feb 1990. 10p. Order Number DE93721406. Source: OSTI; NTIS.

This paper describes a test performed in two rooms, one thermally light and the other thermally heavy, in order to investigate the influence of the thermostat location on thermal comfort and on energy consumption. The ability of three thermostat types to maintain a constant equivalent temperature was tested for two different thermostat locations, one traditional location on the wall and the other in the living space close to the center of the room. During each test period the free heat (light and artificial persons) was varied after a preset and repeatable schedule. At two points, close to each of the thermostat locations, the equivalent temperature was recorded. After each test the maximal variation of the equivalent temperature was calculated. The main result was that the temperature variation in the living space can be reduced when the room thermostat is removed from a wall position to a location in the living space. The laboratory test was supplemented with a field test in the Danish Parliament building and the Royal Theater, chosen as two large rooms where the locations of room thermostats are decided for architectural rather than engineering reasons. (au).

844 (HY/SPL-E–6/1991) **Change in energy consumption and the stage in the family life cycle.** Melasniemi-Uutela, H. (Tilastokeskus, Helsinki (Finland)). Helsinki Univ. (Finland). Dept. of Social Psychology. 1991. 45p. (In Finnish). Order Number DE93711151. Source: OSTI; NTIS.

The study examines the changes that occured between 1982 and 1990 in the residential energy consumption of more than 300 households living in single-family houses in Uusimaa province, Finland, with special reference to the connection of the changes with the stage in the family-life cycle. The houses had been completed between 1975 and 1982 and used municipal district heating or direct electric heating. The families' residential energy consumption, as adjusted for weather, rose by 13 per cent on average from 1982-85 to 1989-90. Their water consumption also increased, but the increased energy consumption was mainly due to the increased use of household electricity and heating energy proper. The differences between households concerning the levels of energy and water consumption and the changes in these were only to some extent explained by the stage in the family-life cycle. The connection of different components with the level of consumption and with the change in consumption was considered in detail with respect to families at a standardized stage in the family-life cycle. Families with little change in consumption were usually among those whose initial energy consumption was low. On the other hand families with the biggest rise in consumption were often among those whose initial energy consumption was higher than average. Their level of consumption in 1989-90 was higher than average. The study's most significant result was that the observed trends in change were not universal. The great differences in energy and water consumption between households with the same family structure indicate clearly that the differences were due to differences between the families' life-styles.

845 (LBL–29752) **Using infrared thermography for the study of heat transfer through building envelope components.** Arasteh, D. (Lawrence Berkeley Lab., CA (United States)); Beck, F.; Griffith, B.; Acevedo-Ruiz, M.; Byars, N. Lawrence Berkeley Lab., CA (United States). Nov 1991. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00098 ;AI79-86BP63401. (CONF-920108–3: International air conditioning, heating, refrigerating exposition, Anaheim, CA (United States), 25-29 Jan 1992). Order Number DE93000636. Source: OSTI; NTIS; GPO Dep.

Heat transfer through building envelope components is typically characterized by one number, the conductance. Such a characterization is best suited for homogeneous samples since it does not quantify or illustrate spatial variations within a sample. However, the growing use of advanced wall and window insulations with existing framing materials has increased the importance of understanding spatial heat transfer effects within building envelope components. An infrared thermography laboratory has been established to provide detailed quantitative and qualitative information on the spatial heat transfer effects of building envelope materials. The use of this facility for more effective product development and more accurate product development and more accurate product characterization is discussed.

846 (LBL–31562) **California Institute for Energy Efficiency 1991 annual report.** Lawrence Berkeley Lab., CA (United States). [1991]. 37p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00098. Order Number DE93001569. Source: OSTI; NTIS; GPO Dep.

This 1991 annual report of the California Institute for Energy Efficiency (CIEE) presents current research topics along with institutional events. Various modes for energy conservation are reported including: residential and commercial air distribution systems, thermal energy storage, natural gas and electric powered vehicles, gas-filled thermal insulation panels, exhaust hoods, shade trees and white surfaces, industrial natural gas burners, and lighting systems. (GHH)

847 (LBL–32091) **WINDOW 4.0: Program description. A PC program for analyzing the thermal performance of fenestration products.** Lawrence Berkeley Lab., CA (United States). Mar 1992. 83p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00098. (TA–285). Order Number DE93001468. Source: OSTI; NTIS; GPO Dep.

WINDOW 4.0 is a publicly available IBM PC compatible computer program developed by the Windows and Daylighting Group at Lawrence Berkeley Laboratory for calculating total window thermal performance indices (e.g. U-values, solar heat gain coefficients, shading coefficients, and visible transmittances). WINDOW 4.0 provides a versatile heat transfer analysis method consistent with the rating procedure developed by the National Fenestration Rating Council (NFRC). The program can be used to design and develop new products, to rate and compare performance characteristics of all types of window products, to assist educators in teaching heat transfer through windows, and to help public officials in developing building energy codes. WINDOW 4.0 is a major revision to WINDOW 3.1 and we strongly urge all users to read this manual before using the program. Users who need professional assistance with the WINDOW 4.0 program or other window performance simulation issues are encouraged to contact one or more of the NFRC-accredited Simulation Laboratories. A list of these accredited simulation professionals is available from the NFRC.

848 (LBL–32257) **Building performance analysis using interactive multimedia concepts.** Selkowitz, S.; Beltran, L.; Osterhaus, W.; Papamichael, K.; Schuman, J.; Sullivan, R.; Wilde, M. Lawrence Berkeley Lab., CA (United States). Apr 1992. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00098. (CONF-920828–16: American Council for an Energy-Efficient Economy (ACEEE) summer study on energy efficiency in buildings, Pacific Grove, CA (United States), 30 Aug - 5 sep 1992). Order Number DE92041177. Source: OSTI; NTIS; GPO Dep.

We describe LBL's involvement with multimedia concepts by discussing several modules of an advanced computer-based building envelope design tool. The qualitative and quantitative aspects of the building design process are accommodated within the same design tool which uses object-oriented programming procedures. This computer-based concept utilizes images (buildings, landscapes, models, documents, etc.), expert systems (knowledge bases, i.e., lighting design, site planning, HVAC design, etc.), and data bases (design criteria, utility rates, climatic data, etc.) in addition to more traditional simulation models to evaluate building design alternatives.

849 (NEI-DK–946) **Electricity consumption and saving at Fjordskolen, Egvad municipality.** Tarm Elektricitetsvaerk Am/S (Denmark). May 1991 21p. (In Danish). Order Number DE93721435. Source: OSTI; NTIS.

An example of a report in relation to energy consultancy (pilot project) published in connection with "Haandbog i energiraadgivning" (Handbook on energy consultancy), Danske Elvaerkers Forening, 1992.

The aim was to investigate electricity consumption at Fjord school, in Denmark, and potentials for saving electricity. In 1990/91, 242,000 kWh were used, and the cost was 236,000 Danish kroner. The school is heated by district heating and the consumption here was 780,000 kWh, costing 332,000 Danish kroner. Water consumption during this period was 3,200 m^3, costing 45,000 Danish kroner. Two thirds of the school's electricity consumption is used for lighting purposes, the remainder for ventilation, pumps and electronic equipment. It was concluded that substituting fluorescent lamps with low consumption bulbs or discharge lamps would save 27% of electricity consumption, (71,000 Danish kroner p.a.) The consultants also recommended control of district heating consumption which could save 5-10% of energy consumption. A reduction in electricity would also result in a reduction of pollutive emission from the relative power plant it is stated. For every 10,000 kWh electricity saved, emission is reduced (under currently prevailing conditions and where coal is used as fuel) by 55 kg SO_2, 19 kg NO_x, and 11,000 CO_2. (AB) (59 refs.).

850 (NEI-DK–948) **Electricity consumption and savings at the Danish Energy Agency, Landemaerket 9 - 11.** Koebenhavns Belysningsvaesen, Copenhagen (Denmark). Oct 1991 39p. (In Danish). Order Number DE93721434. Source: OSTI; NTIS.

An example of a report in relation to energy consultancy (pilot project) published in connection with "Haandbog i energiraadgivning" (Handbook in energy consultancy), Danske Elvaerkers Forening, 1992.

In 1990 the electricity consumption for the Danish Energy Agency building was 198,000 kWh, costing 168,000 Danish kroner. The building utilizes district heating, here using during the year 1990 - 606 MWh (204,000 Danish kroner). Electricity consumption covers lighting (40%), electronic equipment (33 %), cooling systems (13%), ventilation (4%), and photocopying machines and water heaters (9%). It was reckoned that the agency, after following the recommendations of the consultants, could save 81,000 kWh answering to 29% of the total electricity consumption, which at current prices would mean saving 61,000 Danish kroner. 4,500 Danish kroner could be saved by changing out the fluorescent bulbs. The necessary investment would be 327,000 Danish kroner with a repay period of 5 years. If the computer equipment was also changed out the total saving would be 158,200 kWh p.a. answering to 57% of the agency's total electricity consumption. The consultants recommended the control of electricity and district heating consumption, this would increase overall saving by 5-10%. These electricity savings would also result in a reduction of pollutive emission from coal-fired power plants, currently to the amount of 55 kg SO_2, 19 kg NO_x and 11,000 kg CO_2. (AB).

851 (NEI-DK–951) **Measuring programme for combined solar energy and natural gas heat pump system.** Christensen, H.J.; Brink, A. Aidt Miljoe, Hadsten (Denmark). [1992] 62p. (In Danish). Contract TR-88.196. Order Number DE93721385. Source: OSTI; NTIS.

The aim of the project was to estimate the value of combining an energy absorber with a subsurface storage facility in order to increase the yield and efficiency of a heat pump system. The construction of the system and the measuring programme are described, and the results of the latter are given. Measurements documented that 40% of natural gas otherwised used could be saved in relation to this type of system. The natural-gas-driven heat pump system (60kw) supplied 20 households and a communal building with heat and domestic hot water throughout the year. The heat was distributed by a low temperature district heating system. The heat pump system was supplied with surplus heat from the glass areas that joined the residential buildings to each other. Heat storage took place in pipes laid at a depth of 160 cm under the earth in the communal yard. The mass of earth acted as a heat storage facility for passive solar energy and made it possible for the heat pump to operate at the highest efficiency level throughout the winter months. (AB).

852 (NEI-DK–963) **OLF and energy. Phase 2: OLF values before and after cleaning the ventilation system. Final report on the pilot project.** Pejtersen, J.; Clausen, G.; Fanger, P.O. Danmarks Tekniske Hoejskole, Lyngby (Denmark). Lab. for Varme- og Klimateknik. Aug 1992 66p. (In Danish). Contract ENS-1213/90-0012. Order Number DE93721421. Source: OSTI; NTIS.

EFP-90.

The aim of the project was to investigate the influence of cleaning and retrofitting the ventilation system on the air quality in buildings. The concentration of pollution components in a building is dependent on pollution concentration both in- and outdoors and the rate of ventilation. In order to quantify the pollution concentration it is important to measure both the concentration (in chemical, biological or sensory units) and the flow of outside air throughout the system. It has been found that materials in a room, such as carpets, furniture etc., and even the ventilation system, are often

greater sources of pollution than the people in the room. The introduction of the OLF unit for the strength of a sensory pollution source and the decipol unit for the experienced air quality has made it possible to quantify all the pollution sources in a room. In this case the cleaning of the ventilation system resulted in the dominating sensory pollution source strength for the humidifier, of 216 OLF, being removed. ("OLF", is an abbreviation of the Latin word "olfactus", the sense of smell, and is the unit of measurement of the strength of sensory pollution sources). The cleaning of the ventilation system resulted in a rise in the rate of ventilation by 150%. There was a tendency that the air quality in the rooms was improved after the ventilation system was cleaned. The intensity of most of the symptoms experienced by the employees after cleaning the ventilation system remained about the same. (AB) (31 refs.).

853 (NEI-DK–964) **Need-regulated ventilation - the scientific background: Final report on the research project.** Clausen, G.; Thorstensen, E.; Pejtersen, J.; Fanger, P.O. Danmarks Tekniske Hoejskole, Lyngby (Denmark). Lab. for Varme- og Klimateknik. Jul 1992 116p. (In Danish). Contract EM-1213-702-01-01;Contract EM-1213/87-2. Order Number DE93721420. Source: OSTI; NTIS.

EFP-87.

The aim was to investigate the potentials for energy saving in relation to a need-regulated ventilation system. A series of tests were carried out in connection with the determination of air quality in schools. It is claimed that by utilizing need-regulated ventilation it is possible to achieve energy efficiency without loss of indoor air quality. The principle is to accomodate the amount of inlet air to the actual ventilation need in a room. In such a ventilation system the inlet of outdoor air is controlled by a sensor for a specified pollutant so that the concentration of the chosen pollutant is kept under a specified value. Tests of this system have in some cases shown a reduction in the consumption of energy. Methods and calculations used for the determination of air quality in schools are described and results are presented. Conclusions were that the use of need-regulated ventilation can result in a lower quality of air when the load from the controlling parameters is low, and that the sensorized pollutive sources in the schools investigated were persons (39%), ventilation system (39%) and materials (22%). (AB) (18 refs.).

854 (NEI-DK–965) **Reduction of ventilation needs by cleaning the return air: Final report on the research project.** Clausen, G.; Moeller, S.B.; Fanger, P.O. Danmarks Tekniske Hoejskole, Lyngby (Denmark). Lab. for Varme- og Klimateknik. Jun 1992 41p. (In Danish). Contract EM-1213-504-02-01;Contract EM-1213/85-4. Order Number DE93721419. Source: OSTI; NTIS.

EFP-85.

A detailed description of the dimensioning and construction of an air washer the aim of which is, in relation to indoor pollution, to reduce the odour caused by tobacco smoking, is supplemented by a paper "The Impact of Air Washing on Environmental Tobacco Smoke Odor". This paper was presented at the conference "Indoor Air '87" in Berlin. The main text is richly illustrated with diagrams and numerical data. (AB).

855 (NEI-DK–972) **Energy technology in public swimming baths.** Publikation, 32/1992. Dansk Svoemmebadsteknisk Forening, Taastrup (Denmark). 1992 174p. (In Danish). Order Number DE93721451. Source: OSTI; NTIS.

Energy consumption is high in Danish public swimming baths and so constitutes 40% - 50% of the total operational budget. Statistical data on energy and water consumption gathered from 40 swimming baths are presented in order to illustrate how to set up energy budgets. The publication aims to be a detailed reference book for technicians in relation to projecting, construction and operation of public swimming baths where priority is given to energy conservation. It contains dimensioning criteria with regard to ventilation, the water in the baths, lighting systems and saunas, and in each case advice is given on how to use the least amount of energy. The subject of heat recovery from waste water from the showers, the various means of heating and maintenance and energy control throughout are also discussed with emphasis on energy conservation. (AB) (19 refs.).

856 (NEI-DK–973) **Cooperative housing association Vaarst Vestervang: Preliminary investigations on renewable energy system for sixteen households within a cooperative housing association and experiences gained from the construction phase.** Boelsmand, H. PlanEnergi S/I (Denmark). Aug 1992 38p. (In Danish). Contract TR-89.0584. Order Number DE93721455. Source: OSTI; NTIS.

The building site is located in an agricultural area south-west of the country town of Vaarst in the southern part of the municipal area of Aalborg. The cooperative housing association preferred that heating be provided by a renewable energy source, and that rooms should be heated from under the floor. Ideas from a competition where ideas were offered for heating systems for low energy houses are investigated. The publication presents detailed data on predicted total energy consumption, the proposed energy production systems (individual and district heating systems) and cost benefits. The heating systems dealt with as being feasible comprise wood or straw-fired boilers, individual heat pumps, and solar heating with seasonal storage facilities. Environmental consequences of the various propositions are also presented in the form of tables giving figures for predicted pollutant emissions. (AB).

857 (NEI-DK–975) **Assistance in energy cooperation to the Czechoslovakian energy authorities: Building Sector: Final report.** Energistyrelsen, Copenhagen (Denmark); Statens Byggeforskningsinstitut, Hoersholm (Denmark); Birch og Krogboe Raadgivende Ingenioerkontor, Virum (Denmark). Dec 1991 152p. Order Number DE93721454. Source: OSTI; NTIS.

Sponsored by Commission of the European Communities Directorate-General for Energy XVII/A3.

A study of the possibilities for energy savings in Czechoslovakian buidings, the goal being 30%, is presented. It outlines technical and organizational activities which are prerequisite for achieving this goal. A registration of building stock was carried out in addition to a detailed technical audit conducted in 20 different buildings in Prague and Bratislava and a less detailed collection of data for about 100 other buildings of different categories. On these data energy saving measures were based and a list of priorities was made. Technical recommendation were worked out for energy specifications for revised building regulations for this country. Suggestions for energy saving were optimization of boilers, pipe insulation, radiator valves and metering and roof and facade insulation. It is reckoned that 26%, or 77 PJ can be saved at a total investment of 140 milliard KCS with pay back periods of up to 20 years, based on the world market prices of light fuel oil. Information campaigns could reduce energy consumption by 2-3%. Comprehensive supportive legislation, cost-true prices and new financing offers, short-term courses for engineers and boiler room personnel, an improved transparency of the market and the development of new products via research in addition to a facilitation of interaction with foreign companies are advised. A book of appendices presents detailed data collected during the course of the project. (AB).

858 (NEI-NO–282) **An energy information system for atrium design.** Bryn, I.H. Trondheim Univ. (Norway). Norges Tekniske Hoegskole. 1992 150p. Order Number DE93721638. Source: OSTI; NTIS.

The main topic of this thesis is a presentation and discussion of ISOLDE'S ATRIUM, a computer tool for the design of the energy aspect of atrium buildings. Important issues that are presented are representation of knowledge about the energy aspect of atrium buildings, the capabilities of the simulation tools for atrium buildings and human computer interaction aspects of the system. As an introduction to computer aided building design a presentation is given of some models in the design process and requirements for computer tools to support the design process. One requirement of the design tools is that they should communicate with each other, share data and work on the same model of the buildings. This thesis presents research and standardization work in this area. Examples of existing integrated computer design support tools are also presented. The rest of this thesis presents the structure, the content, the background theory and ideas on user interaction used in ISOLDE'S ATRIUM. ISOLDE'S ATRIUM is a design support system that covers the energy aspect of the design. When fully developed it will contain three parts: General Advice, Simplified

Design Analysis and Detailed Design Analysis. ISOLDE'S ATRIUM is presented by a description of the system structure and a scenario describing an architect using the program. The scenario gives several examples of the information and graphical presentations in the program. Requirements for calculation and simulation programs to study thermal comfort and energy consumption in atrium buildings are presented. 72 refs., 50 figs.

859 (PNL-SA–20288) **Status of state and local adoption of energy standards for new commercial buildings.** Boulin, J.J. (USDOE, Washington, DC (United States)); Conover, D.R. Pacific Northwest Lab., Richland, WA (United States). Sep 1992. 15p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (CONF-920828–15: American Council for an Energy-Efficient Economy (ACEEE) summer study on energy efficiency in buildings, Pacific Grove, CA (United States), 30 Aug - 5 sep 1992). Order Number DE92041329. Source: OSTI; NTIS; GPO Dep.

This paper presents a summary of building energy standards adoption by state and major local governments and how the standards apply to new commercial buildings. Numerous public and private sector agencies and organizations develop energy standards and codes for commercial buildings. These documents serve, among others, state and local legislators and regulators who are interested in requiring their use to reduce the energy consumption of new commercial buildings. Through adoption or adaptation of these documents by state or local governments, minimum acceptable design and construction criteria for new commercial buildings are established in law. The energy standard or code adopted, or used as a basis for a state developed standard, may be any one of a number of documents. The authority of the state to regulate construction may apply throughout the entire state, only to a few types of buildings, or may be absent, in which case local government has regulatory authority. The means of adoption may be by legislation, regulation, municipal code, or other legal vehicle. At the present time there are widespread differences in the energy standards adopted by state and local government and the application of these standards to new commercial buildings.

860 (PNL-SA–20804) **Increasing energy efficiency through improved enforcement of building energy codes.** Shankle, D.L.; Lesperance, A.M.; Fowler, R.A. Pacific Northwest Lab., Richland, WA (United States). Apr 1992. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (CONF-920828–18: American Council for an Energy-Efficient Economy (ACEEE) summer study on energy efficiency in buildings, Pacific Grove, CA (United States), 30 Aug - 5 sep 1992). Order Number DE93001314. Source: OSTI; NTIS; GPO Dep.

The US Government has developed a series of performance standards to improve the energy efficiency of buildings in the United States. Building code officials are central to the implementation and enforcement of the building energy standards. This paper gives survey results that show that building code officials need additional staff, training, and tools to do their work more effectively.

861 (PNL-SA–20909) **Innovation in manufactured housing energy-efficiency programs.** Onisko, S.A. (USDOE Bonneville Power Administration, Portland, OR (United States)); Lee, A.D. Pacific Northwest Lab., Richland, WA (United States). [1992]. 22p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (CONF-920828–11: American Council for an Energy-Efficient Economy (ACEEE) summer study on energy efficiency in buildings, Pacific Grove, CA (United States), 30 Aug - 5 sep 1992). Order Number DE92041341. Source: OSTI; NTIS; INIS; GPO Dep.

The manufactured housing industry has undergone some major changes in the Pacific Northwest. Drafty mobile homes with a reputation for low quality and energy efficiency performance may become a thing of the past thanks to some innovative programs to upgrade manufactured housing sponsored by Northwest utilities and the Bonneville Power Administration. Utilities started paying attention to manufactured housing in the mid 1980s when they learned that up to 50% of new houses sited in their areas were manufactured homes. Preliminary studies indicated that huge energy savings were possible in these homes, more than 50% over the life of the home! Bonneville's first coordinated effort to study the situation was the Manufactured Housing Work Group which was established in the fall of 1986 and included manufacturers, utilities, the Northwest Power Planning Council, Pacific Northwest Laboratory (PNL), trade associations, and regulatory agencies. The Work Group recommended energy programs for manufactured housing based on Bonneville's conservation programs for site-built homes: the Super Good Cents Program (SGC) and the Residential Construction Demonstration Project (RCDP). Research results from the RCDP/SGC Manufactured Housing Program included collection of metered energy end-use data and cost data on individual conservation measures, cost effectiveness analyses, and computer modeling. This research is giving Bonneville the data it needs to recommend the best tactics for keeping the manufactured housing industry on its newfound course of energy efficiency, a direction that is sure to mean higher quality homes for the consumer and energy savings for regional utilities.

862 (PNL-SA–20976) **Relighting for energy efficiency and productivity.** Harris, L. (USDOE, Washington, DC (United States)); Purcell, C.W. Pacific Northwest Lab., Richland, WA (United States). [1992]. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (CONF-920828–13: American Council for an Energy-Efficient Economy (ACEEE) summer study on energy efficiency in buildings, Pacific Grove, CA (United States), 30 Aug - 5 sep 1992). Order Number DE92041336. Source: OSTI; NTIS; GPO Dep.

This paper presents an overview of the process and approach of the Federal Relighting Initiative (FRI). It describes the major steps in relighting Federal buildings for energy efficiency and increased productivity.

863 (PNL-SA–21019) **Analysis of end-use electricity consumption during two Pacific Northwest cold snaps.** Sands, R.D. Pacific Northwest Lab., Richland, WA (United States). [1992]. 17p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (CONF-920828–12: American Council for an Energy-Efficient Economy (ACEEE) summer study on energy efficiency in buildings, Pacific Grove, CA (United States), 30 Aug - 5 sep 1992). Order Number DE92041337. Source: OSTI; NTIS; GPO Dep.

The Pacific Northwest has experienced unusually cold weather during two recent heating seasons. Hourly end-use load data was collected from a sample of residential and commercial buildings during both cold snaps. Earlier work documented the changes in end-use load shapes as outdoor temperature became colder. This paper extends analysis of cold snap load shapes by comparing results from both cold snaps, exploring the variability of electricity consumption between sites, and describing the use of load shapes in simulating system load. Load shapes from the first cold snap showed that hot water use shifted to later in the morning during extremely cold weather. This shift in load also occurred during the second cold snap and is similar to the shift observed on a typical weekend. Electricity consumption averaged across many sites can mask widely varying behavior at individual sites. For example, electricity consumption for space heat varies greatly between homes, especially when many homes are able to burn wood. Electricity consumption for space heat is compared between a group of energy-efficient homes and a group of older homes.

864 (VTT/LVIS2000–1) **Indoor climate seminar.** Seppaenen, O. (ed.) (Helsinki Univ. of Technology, Otaniemi (Finland). Lab. of Heating and Ventilation). Technical Research Centre of Finland, Espoo (Finland). Lab. of Heating and Ventilation. 1989. 168p. (In Finnish). (CONF-8909491–: Conference on climate and water, Helsinki (Finland), 11-15 Sep 1989). LVIS-2000 Research Programme.

The national energy research programme LVIS-2000: Future Building Services is concerned with the control of energy use and indoor climate in buildings of the future. The projects were presented at a one day seminar arranged by the Laboratory of Heating and Ventilation of the Technical Research Centre in Finland which is coordinating the programme. The presentations were focused on following topics: BEMS (Building and Energy Management Systems) in the future, Automation design and user interfaces, A general model for building automation, Control of room temperature, design of interfaces for building automation and simulation of control for air conditioning systems.

866 (VTT/LVIS2000–6) **Indoor climate seminar.** Seppaenen, O. (ed.) (Helsinki Univ. of Technology, Otaniemi (Finland). Lab. of Heating, Ventilation and Air Conditioning). Technical Research Centre of Finland, Espoo (Finland). Lab. of Heating and Ventilation. 1990. 197p. (In Finnish). (CONF-9006427–: Seminar on indoor climate, Espoo (Finland), 7 Jun 1990). Order Number DE93721588. Source: OSTI; NTIS.

LVIS-2000 Research Programme.

The national energy research programme LVIS-2000: Future Building Services is concerned with the control of energy use and indoor climate in buildings of the future. The projects were presented at a one day seminar arranged by the Laboratory of Heating and Ventilation of the Technical Research Centre in Finland which is coordinating the programme. The topics presented at the seminar were: The effect of indoor air on health in office buildings, The effect of air temperature on performance of office work, Emissions from building and interior materials, Experiences of odour panels in indoor climate research, Mould spores and bacteries in the indoor air of rural houses, Ventilation systems in future buildings, Demonstration project of ventilation systems in a block of flats.

867 (VTT/LVIS2000–7) **Energy systems in buildings.** Nyman, M. (ed.). Technical Research Centre of Finland, Espoo (Finland). Lab. of Heating and Ventilation. 1990. 222p. (In Finnish). (CONF-9004368–: Seminar on energy systems in buildings, Espoo (Finland), 26 Apr 1990). Order Number DE93721589. Source: OSTI; NTIS.

LVIS-2000 Research Programme.

The national energy research programme LVIS-2000: Future Building Services is concerned with the control of energy use and indoor climate in buildings of the future. The projects were presented at a one day seminar arranged by the Laboratory of Heating and Ventilation of the Technical Research Centre in Finland which is coordinating the programme. The presentations were focused on following topics: Future cooling systems in Finland, Heating and cooling by absorption, A new central water-based heating, Electric heating in large buildings, Evaluation of the performance of the HVAC equipment in buildings, Infrared switching for controlling the lighting.

868 **Water heater bottom insulation member.** Lewis, B. 28 Jul 1992. Filed date 27 Feb 1992. Canada Patent patent application 2062015. 13p. Source: Micromedia Ltd., Technical Information Centre, 165 Hotel de Ville, Place du Portage, Phase 2, Hull, Quebec, Canada J8X 3X2. Prices: PC $6.00 CAN; MF $4.00 CAN.

A rigid insulation member fits internally at the bottom end of a water heater having an inner tank with an upwardly concave base and an outer shell separated by an insulation gap from the inner tank. The insulation member has a one piece construction comprising an upwardly convex center portion which mates with the concave base of the inner tank, a peripheral ring which spans the insulation gap, and an annular channel between the center portion and the peripheral ring which seats the inner tank of the water heater such that it sits essentially vertically within the water heater. The insulation material used in making the insulation member of the invention should be able to keep its shape when the tank is placed upon it. A product sold under the trade name of Styropour is particularly suitable, but other types of materials and in particular expanded foam materials can be used in forming the insulation member. 3 figs.

869 (ANL/CP–76181) **US maglev: Status and opportunities.** Coffey, H.T. Argonne National Lab., IL (United States). [1992]. 6p. Sponsored by Department of Transportation, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-920802–10: Applied superconductivity conference, Chicago, IL (United States), 23-28 Aug 1992). Order Number DE92041132. Source: OSTI; NTIS; GPO Dep.

Recognizing the development of maglev systems in Germany and Japan, and the growing congestion, air pollution and energy consumption resulting from our current transportation system, the United States, in 1990, embarked on a program to evaluate the potential usefulness of these systems in the US. In this paper, the utility of maglev systems in alleviating some of these problems, progress in the current program, and opportunities for participation by the superconductivity and cryogenic communities are discussed.

870 (ANL/CP–77116) **Dynamic stability of maglev systems.** Cai, Y.; Chen, S.S.; Mulcahy, T.M.; Rote, D.M. Argonne National Lab., IL (United States). [1992]. 58p. Sponsored by Department of Defense, Washington, DC (United States); Department of Transportation, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-9210176–1: 63. shock and vibration symposium, Las Cruces, NM (United States), 27 Oct 1992). Order Number DE92041104. Source: OSTI; NTIS; GPO Dep.

Since the occurrence of dynamic instabilities is not acceptable for any commercial maglev systems, it is important to consider the dynamic instability in the development of all maglev systems. This study is to consider the stability of maglev systems based on experimental data, scoping calculations and simple mathematical models. Divergence and flutter are obtained for coupled vibration of a three-degree-of-freedom maglev vehicle on the guideway which consists of double L-shaped aluminum segments attached to a rotating wheel. The theory and analysis developed in this study provides basic stability characteristics and identifies future research needs for maglev system.

871 (LBL–32384) **Trends in transportation energy use, 1970–1988: An international perspective.** Schipper, L.; Steiner, R.; Meyers, S. Lawrence Berkeley Lab., CA (United States). May 1992. 31p. Sponsored by Environmental Protection Agency, Washington, DC (United States). DOE Contract AC03-76SF00098. (CONF-9108137–4: Asilomar conference on transportation and global climate change: long range options, Pacific Grove, CA (United States), 25-28 Aug 1991). Order Number DE92041166. Source: OSTI; NTIS; GPO Dep.

Personal mobility and timely movement of goods have become increasingly important around the world, and energy use for transportation has grown rapidly as a consequence. Energy is used in transportation for two rather different activities: moving people, which we refer to as passenger travel, and moving freight. While freight transport is closely connected to economic activity, much of travel is conducted for personal reasons. In the OECD countries, travel accounts for around 70% of total transportation energy use. In contrast, freight transport accounts for the larger share in the Former East Bloc and the developing countries (LDCs). In our analysis, we focus on three elements that shape transportation energy use: activity, which we measure in passenger-km (p-km) or tonne-km (t-km), modal structure (the share of total activity accounted for by various modes), and modal energy intensities (energy use per p-km or t-km). The modal structure of travel and freight transport is

important because there are often considerable differences in energy intensity among modes. The average 1988 average energy use per p-km of different travel modes in the United States (US), West Germany, and Japan are illustrated. With the exception of rail in the US, bus and rail travel had much lower intensity than automobile and air travel. What is perhaps surprising is that the intensity of air travel is only slightly higher than that of automobile travel. This reflects the much higher utilization of vehicle capacity in air travel and the large share of automobile travel that takes place in urban traffic (automobile energy intensity in long-distance driving is much lower than the average over types of driving).

872 (NEI-DK–974, pp. 27-33) **Public transport and the economy.** Holmberg, B. (Transportforskningsberedningen, Stockholm (SE)). Hovedstadsraadets Trafikselskab, Valby (Denmark); Trafikministeriet, Copenhagen (Denmark). 1992. 96p. (In Swedish). (CONF-9204202–: Conference on traffic, Humlebaek (Denmark), 10 Apr 1992). In *Traffic at Louisiana: Contributions to the conference.* Order Number DE93721449. Source: OSTI; NTIS.

For persons using the road, travel time, convenience and price are important factors. The car has certain advantages that public transport cannot offer. On average it takes 83 minutes to go by public transport in a city like Stockholm. If you go by car, the same journey takes 47 minutes. The biggest problem for all road users - apart from pollution - is the congestion of the cities. Because of the longer travelling time when using public transport, the congestion is not so serious as to make people give up the car, also despite the fact that buses and trains are much safer than cars. If we look at the number of persons killed in traffic accidents, it is approx. 10 times safer per passenger kilometre to go by bus or train. If cars and buses on the one hand are compared with trains on the other, the train has a structural effect which the other means of transport have not. A railway affects the building pattern; often a concentration of dwellings is seen near it. This gives the railway a competitive edge, since the bus does not have this structural effect. Despite the fact that cars have certain advantages vis-a-vis public transport, the congestion, safety factor and environmental issues will cause a growing number of people to use public transport - particularly so, if this means of transport is improved to be able to compete against the car. (au).

873 (NEI-DK–974, pp. 57-61) **Why is it that people do not choose public transport?.** Norheim, B. (Socialoekonomisk Institut, Oslo (NO)). Hovedstadsraadets Trafikselskab, Valby (Denmark); Trafikministeriet, Copenhagen (Denmark). 1992. 96p. (In Norwegian). (CONF-9204202–: Conference on traffic, Humlebaek (Denmark), 10 Apr 1992). In *Traffic at Louisiana: Contributions to the conference.* Order Number DE93721449. Source: OSTI; NTIS.

Baard Norheim points to the fact that public transport in Norway has declined between 1982-89, despite the fact that there are a long string of socio-economic reasons why public transport should be preferred in cities. Based on the public transport system in Zurich, where 6.4 billion has been invested in the public transport system, Baard Norheim underlines what framework conditions have to be fulfilled for the public transport measures to have the right effect. (au).

874 (NEI-DK–974, pp. 63-67) **Urban environment and transport must always go hand-in-hand.** Hurup, N. (Sven Allan Jensens Tegnestue, Aalborg (DK)). Hovedstadsraadets Trafikselskab, Valby (Denmark); Trafikministeriet, Copenhagen (Denmark). 1992. 96p. (In Danish). (CONF-9204202–: Conference on traffic, Humlebaek (Denmark), 10 Apr 1992). In *Traffic at Louisiana: Contributions to the conference.* Order Number DE93721449. Source: OSTI; NTIS.

Transport and urban environment should not be seen as separate issues, but rather be combined in municipal planning so as to avoid unfortuante mixtures of over-dimensioned and esthetically hasty traffic installations and unattractive architecture. Urban environment and transport planning must be redefined from being rationalistic planning with functionally separated cities to covering the integration of the visual environment, esthetics, architectural unity and environmental sustainability. There should be no more piecemeal traffic renovation projects, but rather an overall formulation of issues, looking at the city as a whole and starting by looking at energy consumption, environmental nuisances, traffic area layout and the unfortunate examples relating to cityscapes, i.e. buildings and open areas. On this basis a prioritized action plan is then made. Efforts should be made to obtain the greatest possible effect with the smallest possible amount of money. In such an action plan, citizens should be actively involved, and the general level of information should be increased. Professional-ideological barriers should be overcome, and the way should be paved for the political and economic will to change planning methods. In municipalities and cities attitudes are slowly changing in urban policy and planning. However, there is still a lot of ground to be covered. The funding of measures to improve the environment and the traffic situation should be provided on the same lines as the government support given through urban renewal schemes. (au).

875 (NEI-DK–974, pp. 75-77) **Transport model for the metropolitan region and development trends in transport.** Larsen, F. (Ingenioerfirmaet Anders Nyvig A/S, Hoersholm (DK)). Hovedstadsraadets Trafikselskab, Valby (Denmark); Trafikministeriet, Copenhagen (Denmark). 1992. 96p. (In Danish). (CONF-9204202–: Conference on traffic, Humlebaek (Denmark), 10 Apr 1992). In *Traffic at Louisiana: Contributions to the conference.* Order Number DE93721449. Source: OSTI; NTIS.

In his presentation, Flemming Larsen describes the expected development of passenger transport in Metropolitan Copenhagen within the next 20-25 years, depending on the planning policy pursued. The starting point for his intervention is the work of the Wuertzen Committee on a strategic transport model, i.e. a model that tries to describe passenger transport in some main corridors and ring connection in Metropolitan Copenhagen. The model operates with a relatively rough zoning, corresponding to the urban and transport structure and computes how many people need to commute between these zones. The model has been used especially to look at transport consequences of industrial developments i Copenhagen. Different strategies for industrial development and siting have been examined and are characterized by stagnation, scattered growth, central growth (i.a. Oerestad) and central growth with special environmental considerations (i.a. a substantial extension of public transport services and the introduction of a road tax for private vehicles). (au).

876 (NEI-DK–974, pp. 85-88) **How can the environmental load of the transport sector be influenced?.** Keiding, H. (Oekonomisk Institut, Koebenhavn Universitet (DK)). Hovedstadsraadets Trafikselskab, Valby (Denmark); Trafikministeriet, Copenhagen (Denmark). 1992. 96p. (In Danish). (CONF-9204202–: Conference on traffic, Humlebaek (Denmark), 10 Apr 1992). In *Traffic at Louisiana: Contributions to the conference.* Order Number DE93721449. Source: OSTI; NTIS.

According to Hans Keiding, local public transport has been hit by three classic types of market failure: the car - the natural competitor to public transport - has a high negative impact on the surrounding environment, but is nevertheless both quicker and cheaper as a means of transport; the product - local public transport - has an aura of being a public good (buses always run, no matter how many or few people use them, which implies economic waste); and in production terms it is characterized by growing economies of scale (public transport stands for a high investment cost and comparatively modest operating cost). Local public transport is thus a trade which cannot be left to the powers of a free market economy without leading to substantial waste. Hans Keiding offers ways of remedying market failure. One of the ways is to use taxes and subsidies as regards the production that puts limits on the activities of local public transport. Another way is to look at the idea of public transport as being a public good, where payment is made according to the marginal utility value for the individual or the individual's willingness to pay, and thirdly that the need for making a profit is eliminated. As regards new tracks of research, Hans Keiding proposes to give much higher priority to researching the question of payment for public transport. "After all, transport is not only a question of traditional engineering skills; economics should also supply high-technology answers for tomorrow's transport systems". (au).

877 (NEI-DK–974, pp. 89-92) **Transport requirements and resource costs.** Hvashoej Joergensen, C. (COWI consult, Lyngby

(DK)). Hovedstadsraadets Trafikselskab, Valby (Denmark); Trafikministeriet, Copenhagen (Denmark). 1992. 96p. (In Danish). (CONF-9204202–: Conference on traffic, Humlebaek (Denmark), 10 Apr 1992). In *Traffic at Louisiana: Contributions to the conference.* Order Number DE93721449. Source: OSTI; NTIS.

Over the last 20 years transport requirements have grown in proportion with the growth of the economy. This has not been the case for other energy consuming sectors, where it has been possible in connection with the energy crises to break the linkage between energy consumption and production. One of the reasons for this may be that some of the technological progress made in the transport sector has been offset by higher performance requirements. The environmental problems of the transport section in the period until the year 2030 do not seem to frightening at first glance, since the result is not much above the 1988 level. However, the goals established with regard to energy and CO_2 emissions mean that energy consumption and emissions must be cut by half compared with the 1988 level. This is where the problem lies buried. It will take dramatic measures to reach these goals. One example is that a change of behaviour will be needed from transport organisations and transpfort users. Furthermore, resource costs will have to be included in transport policy and sector planning. The inclusion of environment costs in the decision-making process was illustrated by means of three examples. These examples were taken from the transit transport in Switzerland and Austria, roads versus railways in Eastern and Western Europe, and alternative propellants for buses. (au).

878 (ORNL/TM–12188) **Technical documentation for the 1990 Nationwide Truck Activity and Commodity Survey Public Use File.** Oak Ridge National Lab., TN (United States). Sep 1992. 137p. 879 (ANL/CP–76897) **Recycling hydrogen and sulfur by microwave chemical processing.** Harkness, J.B.L.; Doctor, R.D. Argonne National Lab., IL (United States). [1992]. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-9209186–2: Conference for southern states on waste minimization, pollution prevention and environmental regulations, Biloxi, MS (United States), 22-24 Sep 1992). Order Number DE92040744. Source: OSTI; NTIS; GPO Dep.

A waste-treatment process is being developed that recovers both hydrogen and sulfur from hydrogen sulfide-contaminated industry waste. The proposed process uses microwave energy to initiate plasma-chemical reactions that dissociate hydrogen sulfide into elemental hydrogen and sulfur. Using a reaction scheme that recovers a hydrogen product has several advantages over the current Claus technology that burns the hydrogen to water. Both processes produce a clean sulfur product that can be recovered and sold. However, the microwave process produces a gaseous stream that is purified and then separated into streams containing the product hydrogen, hydrogen sulfide for recycle to the plasma-chemical reactor, and the process purge containing carbon dioxide and water. Experiments with pure hydrogen sulfide at flow rates of 0.5–1.5 L/min and microwave powers of 400–1,000 W had previously confirmed that conversions of over 90% per pass are possible. Experiments with impurities typical of petroleum refinery waste hydrogen sulfide streams have demonstrated that these impurities are compatible with the plasma dissociation process and that they do not appear to create new waste treatment problems. Later experiments showed that the cyclonic-flow pattern hypothesized by the Russian theoretical analysis of the plasma-chemical process can substantially decrease hydrogen sulfide dissociation energy requirements while increasing conversion. This technology has a long-term potential for saving $500 million to $1,000 million annually in the refining industry.

880 (CONF-9202133–, pp. 403-420) **Glass furnace efficiency evaluation through three-dimensional modelling.** Graca Carvalho, M. da (Instituto Superior Tecnico, Technical Univ. of Lisbon (Portugal)); Nogueira, M. Fachinformationszentrum Karlsruhe, Gesellschaft fuer Wissenschaftlich-Technische Information mbH, Eggenstein-Leopoldshafen (Germany); Commission of the European Communities, Brussels (Belgium). Directorate General for Energy. 1992. 464p. From European seminar on improved technologies for the rational use of energy in the glass industry - a Thermie programme action and exhibition; Wiesbaden (Germany); 4-6 Feb 1992. In *Improved technologies for the rational use of energy in the glass industry. Proceedings.* Order Number DE93702415. Source: OSTI; NTIS (US Sales Only).

The complex interactions between the several phenomena occurring in the several parts of the furnace entails the appearance of numerical procedures able to predict whole furnace (combustion chamber batch and glass tank) by an integrated way. Such modelling approach was followed in the present work. A three-dimensional mathematical model describing the physical phenomena occurring in a glass melting furnace has been developed. This model is based on the solution, through a finite difference/finite volume technique, of conservation equations for mass, momentum, energy and combustion related species, and comprises two main submodels which correspond to the combustion chamber and glass tank domains. The combustion chamber model incorporated physical modelling for the turbulent combusting flow, soot and thermal radiation. In the second domain the glass tank flow, the model deals with the laminar buoyancy driven radiation transfer inside the glass bulk and radiative exchanges between the glass and surrounding surfaces. For air bubbling effect was calculated through a lagrangean formulation which accounts heat and momentum transfer between the disperse bubbles flow and the glass-melt. (orig.).

881 (DOE/CH/10093–123) **Surface-modification technology for scrap tire reuse: A technical brief.** National Renewable Energy Lab., Golden, CO (United States); Energetics, Inc., Columbia, MD (United States). Sep 1992. 15p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-83CH10093 ;AC01-87CE40762. Order Number DE92001179. Source: OSTI; NTIS; GPO Dep.

This technical briefing report describes the DOE-Air Products project to develop the surface-modification technology for scrap tire rubber. It introduces the technology; discusses the project history, status, and feasibility studies; and reviews the potential benefits of the technology with respect to energy use and economics. Preliminary analyses indicate energy savings of approximately 60,000 Btu/lb by substituting surface-modified rubber in polyurethane systems.

882 (DOE/ID/12624–2) **The smelting of taconite to produce ferrosilicon: Phase 3, Task 1: Final report, [April 1991–December 1991].** Dosaj, V.D. Dow Corning Corp., Midland, MI (United States). Feb 1992. 69p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-87ID12624. Order Number DE93000907. Source: OSTI; NTIS; GPO Dep.

Ferrosilicon is conventionally produced by carbothermic reduction of quartz in presence of steel scrap in large open submerged-arc furnaces. This process produces an off-gas, primarily carbon monoxide, which is usually lost by combustion above the bed of raw materials. A 1.2 MW closed, dc furnace located at SCRA's test facility at Charleston, SC was used to demonstrate the feasibility of producing ferrosilicon using taconite tailiags and coke breeze. Taconite tailings, a byproduct of the iron ore concentration process, contain approximately 65% SiO_2 and 20% Fe. Ferrosilicon containing approximately 40% silicon was produced. The raw material feed was added primarily through the hollow electrode. Three tests in the closed, dc plasma furnace provided experience and data for assessing the carbothermic reduction of taconite tailings. Coke

breeze, as the primary source of carbon, and taconite tailings were introduced into the closed furnace through the hollow electrode. The feed was also introduced through a feed port located on top of the furnace cover. Although the feasibility of smelting taconite tailings to produce ferrosilicon was successfully demonstrated, three problems worthy of note experienced during the runs were: The frequent blockage of the off-gas pipe, material blockages in the system that put charge into the furnace through the hollow electrode, and excessive wear on the furnace roof refractories. The first two problems were successfully resolved. Several off-gas pipes were designed, fabricated, and evaluated. Once the offgas system was functional, sustained feed delivery through the hollow electrode was demonstrated. A slag cover as noted in one of the tests to shield the roof from the arc and water cooling of the roof should eliminate excessive wear of the refractories.

883 (EUR–13089) **Pyrolytic combustion installation of textiles wastes with energy recovery.** Paganelli, M. Commission of the European Communities, Luxembourg (Luxembourg). 1991. 33p. (In French). Contract BM/009/84 IT. Source: OSTI; NTIS (US Sales Only).

Technical and economical results of a sixth months campaign on a pyrolytic combustion installation for various textile fibers wastes (2.000 kg/day) are presented. Heat recovery by an oil heat exchanger and smoke treatments are comprised in the process. (A.B.). 2 figs., 7 tabs.

884 (EUR–14020) **Reduction of energy consumption in the washing process of textile fabrics by advanced technology.** Heidemann, G.; Farber, P.; Ravensbergen, D.W.; Bilkert, R.B.; Boer, J.J. de; Holweg, R.B.M.; Van Overmeire, F.; Reed, C.M. Commission of the European Communities, Luxembourg (Luxembourg). 1992. 123p. Contract EN3E-0113-UK. Source: OSTI; NTIS (US Sales Only).

The purpose of the project presented is to develop, on the basis of sound chemical engineering knowledge, a more energy efficient, open-width fabric washer for the textile industry. A survey of existing washers has highlighted the considerable energy losses from open machines, particularly at the nips between tanks, and an early conclusion is that washers should be fully enclosed. Remaining opportunities centre around water/water heat recovery and optimisation of water flow and temperature. For the latter, a combination of laboratory studies and mathematical modelling, particularly of pressure/suction washing and multiple squeeze/roller washing, has been used to elaborate the possibilities. Suction washing emerges as the more effective method, but the complexity and cost of implementation in a suitably distributed manner, with present conceptions, weighs heavily against it. This still leaves refinements of multiple squeeze roller washing as a major contender. Effort continues to resolve the choice of best method, maintaining due regard for commercial acceptability. (author). refs., figs., tabs.

885 (EUR–14136) **Assessment of incineration of industrial wastes. Demonstration projects.** Maniatis, K. Commission of the European Communities, Luxembourg (Luxembourg). 1992. 106p. Source: OSTI; NTIS (US Sales Only).

This report contains the findings of a study which evaluates projects on direct combustion (informations on incineration and incinerators technology) of industrial wastes (wastes description and characteristics) from wastes of the energy demonstration programme of the Commission of the European Communities. Separate abstracts were prepared for the 29 papers of this volume.

887 (HY/SPL-E–7/1992) **The impact of the changes in the distribution system and the role of the consumer on energy consumption.** Kasanen, P.; Savolainen, M. Helsinki Univ. (Finland). Dept. of Social Psychology. 1992. 107p. (In Finnish). Order Number DE93711152. Source: OSTI; NTIS.

The purpose of the study is to analyze the distribution chain of foodstuffs and the role of the consumer as a part of the chain in terms of energy inputs. Connections between the change of the structure of the distribution system and the change in energy consumption are looked for. Attention is paid to the energy consumption shares of the different parts of the distribution chain. as well as to the development of each part as the system changes. The entire distribution chain is focused on from factory to consumer. The results concerning energy consumption are only rough approximations, due to unsatisfactory data and several assumptions in calculations.

888 (KCP–613-4831) **Process waste assessment methodology development to improve waste minimization.** Pemberton, S.E. Allied-Signal Aerospace Co., Kansas City, MO (United States). Kansas City Div. Aug 1992. 228p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00613. Order Number DE93001257. Source: OSTI; NTIS; GPO Dep.

This project was initiated to determine the methodology of process waste assessments (PWAS) and to develop departmental Pollution Prevention Plans at the Kansas City Division of Allied-Signal Inc. A process waste assessment is a systematic approach to perform material balances around processes which generate waste (hazardous and nonhazardous); to identify waste minimization opportunities; to evaluate those opportunities for technical, safety, and cost feasibility, to establish a baseline to monitor the progress of waste minimization; and to accumulate data to satisfy federal, state, and local Environmental, Safety, and Health (ES&H) reporting requirements. Implementation of Pollution Prevention (PP) and PWA activities at the KCD was organized through six major business units. To establish the PWA methodology, eight pilot projects were selected for completion and evaluation. The evaluation of the pilot PWAs resulted in the following accomplishments: lessons learned, PWA Guidance and worksheet revisions, final report format and minimum requirements, identification of training needs, suggestions for an activity index to normalize the waste data to production, "De minimis" criteria, PWA approach in laboratories, and independent audit of the pilot PWAs and Guidance. Also, the PWA team activities led to the development of a Model Departmental Pollution Prevention Plan for a manufacturing department This plan was distributed to other business units to satisfy a requirement from DOE Order 5400.1.

889 (NEDO-ITE–9109) **Survey on CO_2 disposal method using salt groundwater.** New Energy and Industrial Technology Development Organization, Tokyo (Japan). Mar 1992. 98p. (In Japanese). Sponsored by New Energy and Industrial Technology Development Organization, Tokyo (Japan). Order Number DE93723973. Source: OSTI; NTIS.

The paper surveys the technology of a long-term CO_2 storage in underground aquifers of the salt groundwater which cannot be used in the present condition. In this method, used is CO_2 dissolving power which water has. Among petroleum and natural gas accumulation traps, there are a number of unproductive traps including nothing but the water phase. The world's CO_2 potential storage is estimated, making the depth for CO_2 deposition 2000-3000m and assuming from geographical, geological and economic conditions that the potential deposition area is 1% of all the area of sedimentary basins. The estimation result shows that the world's CO_2 potential storage is 320 billion tons-CO_2 which is equal to the world's 15-year CO_2 emissions. In a plant with a CO_2 treatment capacity of 5000tons/day, the cost is 3000yen/ton-CO_2. Energy required for underground CO_2 deposition is 73 kWh/ton-CO_2. This indicates that the method is viable on an economical basis. However, it is necessary to elucidate behaviors of CO_2 under the ground. It is desirable to expand the range of application of this method little by little, placing emphasis on evaluation of environmental effects. 50 refs., 28 figs., 11 tabs.

890 (NEI-DK–947) **Electricity consumption and savings at Dan-Industri Ltd.** NESA A/S, Hellerup (Denmark). Mar 1991 43p. (In Danish). Order Number DE93721433. Source: OSTI; NTIS.

An example of a report in relation to energy consultancy (pilot project) published in connection with "Haandbog i energiraadgivning" (Handbook on energy consultancy), Danske Elvaerkers Forening, 1992.

During 1990, the Danish firm Dan-Industri used 10,287,000 kWh of electricity, costing 4,729,000 Danish kroner. The firm also used 31,100,000 kWh natural gas (2,388,000 Danish kroner) and 370,000 m^3 of water (3,412,000 Danish kroner). Production machines used 37% of the total electricity consumption, use of compressed air accounted for 23%, ventilation systems 14%, lighting 13%, filtering systems 12% and computer equipment 1%. The use of compressed air, the ventilation lighting and filtering systems were considered as covering the area which had the greatest potential for energy saving and were consequently selected for detailed investigation, although it was recommended to examine the production machines and computer equipment at such a time when the purchasing of new equipment was under consideration. There were 11 suggestions regarding methods of saving electricity which should save 1,000,000 kWh p.a. This saving would constitute 16% of of the investigated consumption and 10% of Dan-industri's total electricity consumption. Necessary investment would amount to 420,000 Danish kroner and a repay period of 1.1 years. The recommendations are elaborated in detail and numerical data support their feasibility. (AB).

891 (NEI-DK–949) **Analysis and optimization of industrial processing systems: A handbook on energy-technological analysis.** Sandvig Nielsen, J.; Weel Hansen, M. DK-Teknik, Soeborg (Denmark). 1992 53p. (In Danish). Contract ENS-1223/90-0007. Order Number DE93721438. Source: OSTI; NTIS.

EFP-90.

Throughout recent years a number of research projects have been carried out under the auspices of the Danish Ministry of Energy with the aim of trying out various methods for analysing and optimizing industrial processing systems. The aim of the handbook is to describe relevant techniques in a way that will result in the reader being eventually able to put some of the methods into practice. The focus is on methods which are easily converted to actual energy analyses, namely the "Pinch" method and static modelling. Basic principles for the analysis of thermal systems and a short guide to exergy analysis is given together with an illustrative example. (AB).

892 (NEI-DK–957, pp. 1-6) **Biological degradation of petroleum wastes by airlift biological contactor (A.B.C.).** Suksawad, N. (Environmental Engineering Division, Asian Institute of Technology, Bangkok (TH)); Tran, F.T. Dansk Komite for Affald (DAKOFA), Copenhagen (Denmark). 1992. 278p. (CONF-9206295– : 1. International conference and exhibition on biological waste treatment, Herning (Denmark), 1-4 Jun 1992). In *Biowaste'92: Proceedings*. Order Number DE93721513. Source: OSTI; NTIS.

Sponsored by: ISWA and IAWPRC.

A modified version of the Airlift bioreactor that was successfully tested for aerobic digestion of thick biological sludges was specifically modified for the biodegradation of petroleum wastes. The semi-pilot scale unit was continously operated with hydraulic retention time of 24, 10 and 6 hours at 25, 50 and 100 percent of petroleum waste diluted with domestic waste water. Overall performance showed removal efficiency of oil and phenol above 90 percent, that of TCOD above 85 percent and ammonia nitrogen above 97 percent. With proper culture acclimatization, the toxicity of hundred percent petroleum waste did not hinder the removal efficiency, thanks to the fast mixing and the high oxygen transfer rate of this modified airlift biocontactor. (au) (10 refs.).

893 (NEI-NO–278) **Control of the gas system for a rotary kiln reduction plant.** Schei, T.S. Trondheim Univ. (Norway). Norges Tekniske Hoegskole. 1992 256p. Order Number DE93721628. Source: OSTI; NTIS.

In Part 1 of this thesis a set of generic models suitable for the modeling of gas systems found in metallurgical and other industrial processes and power plants are developed and analyzed. This set includes models for fan/duct, structural volume, thermal capacity, quencher and combustion of gaseous reactants. These control system design models give explicit relations between control inputs like the speed of process fans and measurable outputs like pressure and temperature. The models are used for modeling the gas system part of the rotary kiln reduction process for ilmenite ore at Tinfos Titan & Iron, in Tyssedal, Norway. A main reason why control performance is important for this system, is that the gas in the grate-kiln system is not well sealed from the surrounding atmosphere. Hence, it is important that the pressure in this system is kept as close as possible to the atmospheric pressure. Positive differential pressure leads to dust and toxic gases being discharged into the factory premises. On the other hand, negative differential pressure influences the energy balance, expecially in the kiln, where it can lead to local overheating of the ilmenite pellets. Hence, it influences the quality of the final product. This leakage of air into the kiln also influences the energy economy. In Part 2 a procedure for automatic tuning of proportional-integral-derivative (PID) controllers based on transfer function estimation is developed. A main feature of the tuning procedure is a method for the excitation of a closed-loop system in the most important frequency range with respect to control system performance. The closed-loop system is excited by generating limit cycle oscillations in the system at two different frequencies, the crossover frequency and the critical frequency for the feedback loop. 68 refs., 121 figs.

894 (PNL–8164) **Impact evaluation of an energy savings plan project at ARCO Petroleum Products Company.** Spanner, G.E.; Sullivan, G.P.; Dixon, D.R. Pacific Northwest Lab., Richland, WA (United States). Aug 1992. 21p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE93000839. Source: OSTI; NTIS; INIS; GPO Dep.

This impact evaluation of an energy conservation measure (ECM) that was recently installed at ARCO Petroleum Products Company (ARCO) was conducted for the Bonneville Power Administration (Bonneville) as part of an evaluation of its Energy $avings Plan (E$P) Program. The Program makes acquisition payments to firms that install energy conservation measures in their industrial procsses. The objective of this impact evaluation was to assess how much electrical energy is being saved at ARCO as a result of the E$P and to determine how much the savings cost Bonneville and the region. The impact of the ECM was evaluated with a combination of engineering analysis, financial analysis, interviews, and submittal reviews (ARCO's Proposal and Completion Report). The ECM itself consists of removing one stage of a six-stage compressor so that its inlet control valve can be opened wider, thereby saving the energy that was previously lost at the valve due to pressure drop. Energy savings resulting from this ECM are expected to be 2,112,800 kwh/yr. The ECM cost $367,650 to install, and ARCO received a payment of $158,460 from Bonneville and $82,902 from its serving utility, Puget Sound Power & Light Company, for the acquisition of energy savings. The ECM would not have been installed without the acquisition payment offered under the E$P Program. The levelized cost of these energy savings to Bonneville will be 6.3 mills/kWh over the ECM's expected 15-year life, and the levelized cost to the region will be 15.8 mills/kWh.

895 (SAND–92-1290C) **Thermal coating development for impulse drying.** Lenling, W.J. (Thermal Spray Technologies, Watertown, WI (United States)); Smith, M.F.; Orloff, D.I. Sandia National Labs., Albuquerque, NM (United States). [1992]. 6p. Sponsored by USDOE, Washington, DC (United States); Institute of Paper Science and Technology, Atlanta, GA (United States). DOE Contract AC04-76DP00789 ;FG02-85CE40738. (CONF-9206135–6: 1992 international thermal spray conference, Orlando, FL (United States), 1-5 Jun 1992). Order Number DE93000710. Source: OSTI; NTIS; GPO Dep.

A plasma sprayed coating has been developed for the heated surface of rolls used in a new energy-efficient paper drying process, known as "Impulse Drying," which could save the US paper industry an estimated $800 million annually in reduced energy costs. Because impulse drying rolls operate at higher surface temperatures than conventional, the thermal properties of the roll surface must be carefully tailored to prevent sheet delamination. A special plasma sprayed thermal barrier coating has been developed to control thermal mass, heat transfer, and steam infiltration. A coated test platen significantly outperformed a comparable uncoated steel platen in preliminary experiments with a heavy-weight

paper grade on a laboratory-scale impulse drying simulator. The coating was then tested on the roll of a pilot-scale impulse dryer. In comparison with conventional wet-pressing, linerboard that was impulse dried showed improved water removal as well as improved physical properties, such as density and specific elastic modulus. The successful prototype coating design has three plasma sprayed layers that are deposited sequentially: (1) a nickel alloy bond coat; (2) a thick 17% porous, zirconia thermal barrier; and (3) a thin, 5–7% porous, zirconia top coat.

896 (YMP-A–33) **Innovations and applications of low- and non-waste technology in the Finnish industry.** Suominen, L. (Insinoeoeritoimisto Mexpert Oy, Espoo (Finland)). Ministry of the Environment, Helsinki (Finland). Environmental Protection Dept. 1985. 242p. (In Finnish). Order Number DE93711136. Source: OSTI; NTIS.

The aim of this subproject has been to publish a handbook of the innovations of Low- and Non-Waste Technology in the Finnish industry. Alltogether nineteen innnovation examples of Low- and Non-Waste Technology in the Finnish industry has been prepared during the summer 1984, where most of the examples are represented by the Finnish pulp and paper and metallurgical industry.

897 **Condensate recovery for steam injection.** den Otter, A.J.; Campbell, P.J.; Nguyen, B.H. 23 Jul 1992. Filed date 22 Jan 1991. Canada Patent patent application 2034749. 13p. Source: Micromedia Ltd., Technical Information Centre, 165 Hotel de Ville, Place du Portage, Phase 2, Hull, Quebec, Canada J8X 3X2. Prices: PC $6.00 CAN; MF $4.00 CAN.

Water injection has the potential to increase the gross power output of a turbine, or to decrease the amount of fossil fuel consumed for a given useful power output, and to reduce the level of nitrogen oxides emitted by the turbine. It would be desirable to inject water into the turbines which are utilized in the compressor stations of oil or gas transmission networks; however, many such stations are at remote locations where the absence of a suitable water supply has prevented the use of a water injection technique. A process is thus provided to improve the operation of a fossil-fuel-fired turbine by condensing water from the exhaust effluent of the turbine, transferring this water into a condensate storage vessel, and injecting the stored water into the turbine. The process of the invention utilizes a conventional waste heat boiler to use the energy contained in the hot exhaust gas from the turbine to convert water into steam. The gas exiting the waste heat boiler is condensed in a corrosion resistant heat exchanger, and the condensate is stored in a fiber reinforced plastic tank and treated before feeding to the boiler feedwater tank. Control valves are provided for roughly balancing the amount of steam produced by the waste heat boiler with the amount of steam required for injection. 1 fig.

898 **Machine for sorting plastic bottles as a function of their plastic composition in order to recycle the same.** Morin, A.; Hamel, J.C. 21 Jun 1992. Filed date 20 Dec 1990. Canada Patent patent application 2032792. 26p. Source: Micromedia Ltd., Technical Information Centre, 165 Hotel de Ville, Place du Portage, Phase 2, Hull, Quebec, Canada J8X 3X2. Prices: PC $6.00 CAN; MF $4.00 CAN.

An apparatus and method are disclosed for sorting objects such as bottles made of different transparent or translucent plastic materials according to the kind of plastic material of which these objects are made. The method consists in producing a beam of ultraviolet light and subjecting each object to be sorted to this beam in a detection zone. The intensity of the beam transmitted by the object is detected at different wavelengths selected within a range encompassing the cutoff wavelengths of the different plastic materials to be sorted. The cutoff wavelength is different for each plastic material, and is the wavelength above which the coefficient of light transmission through the plastic material drastically increases. By comparing with each other the values of the intensity detected at the different wavelengths, one can determine the cutoff wavelength of the plastic material and thus identify it. A sorting apparatus would use such an ultraviolet detector in conjunction with a conveying means in order to operate a processing device which would selectively direct the objects conveyed before the detector into different bins corresponding to the kinds of plastic materials being sorted. An apparatus according to the invention has been successfully tested for sorting bottles made of polyvinyl chloride and polyethylene tetraphthalate in real time. 2 figs.

Sponsored by USDOE, Washington, DC (United States). DOE Contract FG01-91CE26616. Order Number DE93002847. Source: OSTI; NTIS; GPO Dep.

The operation and performance of a system using large commercial heat pumps to heat and cool two public buildings are reported. One of the buildings houses local government offices and the other the jail. The system uses the underground salt water at the site as the energy exchange medium. Included are: the operations summary, system performance, operating procedures, and operating modes. (MHR)

900 (EUR–14254, pp. 5-23) **The role of composting in an integrated waste management system.** Van Belle, W.A. Commission of the European Communities, Luxembourg (Luxembourg). 1992. (CONF-9109436–: Workshop on Composting and Compost Quality Assurance Criteria, Angers (France), 11-13 Sep 1991). In *Composting and compost quality assurance criteria.* 433p. Order Number DE93721257. Source: OSTI; NTIS (US Sales Only).

For household waste, the ideal hierarchy is led by the prevention of waste (10%), followed by reclaiming (50%), next come incineration (25%) and lastly land filling (15%). for the future, only the two last fractions will be allowed to be land filled. The purpose of this paper is to demonstrate the key role composting can and should play in achieving the ambitious 50% reclaiming goal by the year 2000. (A.B.). 2 refs., 18 figs., 3 tabs.

901 (EUR–14254, pp. 24-37) **Objectives for the development of composting in France: a strategic approach.** Noyon, N. (ANRED, 21 - Dijon (FR)). Commission of the European Communities, Luxembourg (Luxembourg). 1992. (CONF-9109436–: Workshop on Composting and Compost Quality Assurance Criteria, Angers (France), 11-13 Sep 1991). In *Composting and compost quality assurance criteria.* 433p. Order Number DE93721257. Source: OSTI; NTIS (US Sales Only).

The strategic approach adopted in France to develop waste composting responds to a concern for reconciling a 'treatment' objective and a 'production' objective, both of which are targeted by managers responsible for the disposal of waste with a high organic content. In terms of environmental concern, this means managing flows of pollutants whose nature is conditioned by the quality of the waste itself as well as by the means of collection and treatment involved. It is necessary to integrate initially in this approach a determination to reduce as much as possible the polluting load of 'heavy metals' and 'non-fermentable matter' contained in consumer goods and ultimately to take into account the actual needs of compost users which may lead to a blend of several compost categories. (A.B.). 6 figs., 1 tab.

902 (EUR–14254, pp. 43-61) **Survey on biowaste activities in Denmark and the nordic countries.** Jespersen, L.M. Commission of the European Communities, Luxembourg (Luxembourg). 1992. Source: OSTI; NTIS (US Sales Only).

A survey on biowaste activities in the Nordic countries has been carried out primarily concentrating on systems suited for collection and treatment of household biowaste from societies with more than 2000 inhabitants. Of the Nordic countries only Denmark and Sweden have introduced such systems until now. The legislative aspects concerning recycling of biowaste have been examined, and 7 ongoing biowaste collection systems and 5 central biowaste

recycling plants in Denmark and 7 ongoing biowaste collection systems and 2 central biowaste recycling treatment plants in Sweden have been evaluated as regards the collection system, the treatment system, environmental and sanitary aspects, working environment, product quality and recycling efficiency. (author). 4 refs., 1 fig., 10 tabs.

903 (EUR–14254, pp. 62-68) **The Danish programme on joint biogas plants.** Sandholt, K. (Atomenergikommissionen, Copenhagen (Denmark)). Commission of the European Communities, Luxembourg (Luxembourg). 1992. (CONF-9109436–: Workshop on Composting and Compost Quality Assurance Criteria, Angers (France), 11-13 Sep 1991). In *Composting and compost quality assurance criteria.* 433p. Order Number DE93721257. Source: OSTI; NTIS (US Sales Only).

The Action Programme for Joint Biogas Plants in Denmark was drawn up by the ministries of Agriculture, Energy and the Environment with the purpose to clarify whether, through a technological development of full-scale joint biogas plants, commercially competitive plants could be developed. Anaerobic digestion has several advantages compared to composting. Most importantly biogas is a renewable energy source, from which electricity can be generated. Also, composting results in a 50% loss of nitrogen due to ammonia volatilization. All nutrients are preserved throughout the digestion process. Furthermore, in a joint biogas plant, the nutrients are automatically recycled to the farmland, due to the associated transport infrastructure. Pre-sorted MSW = Municipal Solid Wastes is not used in joint biogas plants, and poses no biological problems. (author). 3 figs.

904 (EUR–14254, pp. 69-80) **The composting process applied to sewage sludge and source separated refuse.** Stentiford, E.I. (Leeds Univ. (United Kingdom)). Commission of the European Communities, Luxembourg (Luxembourg). 1992. (CONF-9109436–: Workshop on Composting and Compost Quality Assurance Criteria, Angers (France), 11-13 Sep 1991). In *Composting and compost quality assurance criteria.* 433p. Order Number DE93721257. Source: OSTI; NTIS (US Sales Only).

Source separation both for municipal solid waste (MSW) and sewage sludge offers one of the most cost effective routes for improving the quality of the raw material. Both of these wastes are amenable to composting using a wide range of process systems. Provided the necessary conditions of aeration, temperature and moisture are maintained then systems from low cost windrows to high cost reactor systems can all produce acceptable composts. (author). 10 refs., 4 figs., 3 tabs.

905 (EUR–14254, pp. 85-93) **The control of the composting process and quality of end products.** Bertoldi, M. de (Udine Univ. (IT)). Commission of the European Communities, Luxembourg (Luxembourg). 1992. (CONF-9109436–: Workshop on Composting and Compost Quality Assurance Criteria, Angers (France), 11-13 Sep 1991). In *Composting and compost quality assurance criteria.* 433p. Order Number DE93721257. Source: OSTI; NTIS (US Sales Only).

After a definition of composting, this paper presents relations between the starting materials composition, the composting parameters (temperature, aeration, moisture, carbon/nitrogen ratio, ph level), the composting process control and the end product quality. (A.B.). 21 refs.

906 (EUR–14254, pp. 94-97) **Parameters for sorting/composting of municipal solid wastes.** Morvan, B. (Centre National Machinisme Agricole, Genie Rural, Eaux et Forets (CEMAGREF), 35 - Rennes (FR)). Commission of the European Communities, Luxembourg (Luxembourg). 1992. (CONF-9109436–: Workshop on Composting and Compost Quality Assurance Criteria, Angers (France), 11-13 Sep 1991). In *Composting and compost quality assurance criteria.* 433p. Order Number DE93721257. Source: OSTI; NTIS (US Sales Only).

The organic matter required for the production of urban compost may be provided by several categories of waste i.e. raw urban waste or refuse presorted at source, green waste, and kitchen waste. In order to ensure the sale of this urban compost, positive quality criteria such as levels of organic matter, CaO, MgO, N, P_2O_5 and K_2O can be defined. It is also possible to determine thresholds for unwanted particles such as glass, plastics, and metals since these impurities are a major factor in the low selling price of urban compost. (author). 2 tabs.

907 (EUR–14254, pp. 98-102) **Anaerobic digestion of source-sorted MSW.** Breinholt, T. (Atomenergikommissionen, Copenhagen (Denmark)). Commission of the European Communities, Luxembourg (Luxembourg). 1992. (CONF-9109436–: Workshop on Composting and Compost Quality Assurance Criteria, Angers (France), 11-13 Sep 1991). In *Composting and compost quality assurance criteria.* 433p. Order Number DE93721257. Source: OSTI; NTIS (US Sales Only).

In Denmark, various means of disposing of municipal solid waste (MSW) have been tried out. As one of the novel methods, anaerobic digestion seem to offer many advantages compared to more traditional ways of handling MSW. A 3-year Action Plan involving 9 full-scale centralized biogas plants has just been concluded, and the results have shown, that mixing animal waste with other types of waste such as MSW, sewage sludge and industrial organic waste is economically, environmentally and agriculturally very advantageous. Such plants could be the waste treatment plants of the future. (author). 1 fig., 1 tab.

908 (EUR–14254, pp. 103-109) **Dry anaerobic conversion of municipal solid waste by means of the Dranco process.** Six, W. (Organic Waste Systems N.V., Gent (BE)); Baere, L. de. Commission of the European Communities, Luxembourg (Luxembourg). 1992. (CONF-9109436–: Workshop on Composting and Compost Quality Assurance Criteria, Angers (France), 11-13 Sep 1991). In *Composting and compost quality assurance criteria.* 433p. Order Number DE93721257. Source: OSTI; NTIS (US Sales Only).

The Dranco process has been developed for the conversion of solid organic wastes, specifically the organic fraction of municipal solid waste (MSW), to energy and an humus-like final product. The Dranco process can be compared to landfill gas production, accelerated by a factor 1000. A Dranco installation with a digester of 808 m^3 treating 10.500 tons of source separated waste per year will be constructed in 1991 at Brecht, Belgium. A description of the plant is elaborated. A demonstration plant of 56 m^3 is in operation since several years in Gent, Belgium using mixed garbage as feedstock. The gas production process is finalized in 3 weeks. The final product is dewatered and further stabilized in a 10 day during aerobic posttreatment. (A.B.). 2 refs., 2 figs., 3 tabs.

909 (EUR–14254, pp. 110-116) **Odour emissions from composting plants.** Bidlingmaier, W. (Stuttgart Univ. (Germany)). Commission of the European Communities, Luxembourg (Luxembourg). 1992. (CONF-9109436–: Workshop on Composting and Compost Quality Assurance Criteria, Angers (France), 11-13 Sep 1991). In *Composting and compost quality assurance criteria.* 433p. Order Number DE93721257. Source: OSTI; NTIS (US Sales Only).

The principal sources of odors in a composting plant are: the receiving area, the pretreatments, the storage area, the rotting area, the final treatment. Various solutions for these sources are presented with results. (A.B.). 1 ref., 8 tabs.

910 (EUR–14254, pp. 117-130) **Microbial emissions from composts made for mushroom production and from domestic waste.** Lacey, J. (Rothamsted Experimental Station, Harpenden (United Kingdom)); Williamson, P.A.M.; Crook, B. Commission of the European Communities, Luxembourg (Luxembourg). 1992. (CONF-9109436–: Workshop on Composting and Compost Quality Assurance Criteria, Angers (France), 11-13 Sep 1991). In *Composting and compost quality assurance criteria.* 433p. Order Number DE93721257. Source: OSTI; NTIS (US Sales Only).

The handling of freshly made compost, whether made for mushroom production or from domestic waste can result in the emission of large numbers of microorganisms. Actinomycete and fungal spores exceeded concentrations associated with allergic alveolitis and Aspergillus fumigatus was sometimes abundant, especially in domestic waste composts, presenting a risk of asthma, alveolitis and infection. Numbers of Gram-negative bacteria were consistently greater than levels recommended to avoid endotoxin effects. The hazard from airborne spores is less in growing houses and the

risk is mostly from immediate asthmatic reactions to moulds growing on the compost or wooden boxes. (author). 20 refs.

911 (EUR–14254, pp. 131-140) **Composting control parameters and compost product characteristics.** Lopez-Real, J. (London Univ. (United Kingdom)); Vere, A. Commission of the European Communities, Luxembourg (Luxembourg). 1992. (CONF-9109436–: Workshop on Composting and Compost Quality Assurance Criteria, Angers (France), 11-13 Sep 1991). In *Composting and compost quality assurance criteria.* 433p. Order Number DE93721257. Source: OSTI; NTIS (US Sales Only).

The composting process is a highly flexible biodegradative mechanism which can be engineered to meet objectives of either weight, volume or moisture reduction of organic wastes and potentially the production of a marketable end product. Control parameters reflecting these choices are discussed together with the characteristic of the end products that result. Flexibility towards standards and specifications are urged with respect to both processing and to end product in order to allow composting to achieve its full potential for helping to solve societal waste problems and conservation of natural wetland habitats. (author). 13 refs., 1 fig., 1 tab.

912 (EUR–14254, pp. 145-148) **Marketing of standardized composts.** Barth, J. (German Compost Quality Assurance Organization, Oelde (DE)). Commission of the European Communities, Luxembourg (Luxembourg). 1992. (CONF-9109436–: Workshop on Composting and Compost Quality Assurance Criteria, Angers (France), 11-13 Sep 1991). In *Composting and compost quality assurance criteria.* 433p. Order Number DE93721257. Source: OSTI; NTIS (US Sales Only).

Compost needs a standardized quality product in order to be sold on a large scale. If it is produced according to the criteria and directions of the RAL compost quality sign of the German Compost Quality Assurance Organization it fulfills these requirements. Compost needs a marketing strategy like any other product. Developing compost marketing models requires knowledge of special characteristics of the compost market. These characteristics and the comparison with competitive industries show that the model for a common marketing organization of the compost producers will have the best chance to guarantee market success. This marketing organization has to be established now before the large compost quantities reach the market, which is to be reckoned with in the near future. (author). 3 refs.

913 (EUR–14254, pp. 149-164) **Assessment study on organic fertilizers.** Hedegaard, M. Commission of the European Communities, Luxembourg (Luxembourg). 1992. (CONF-9109436–: Workshop on Composting and Compost Quality Assurance Criteria, Angers (France), 11-13 Sep 1991). In *Composting and compost quality assurance criteria.* 433p. Order Number DE93721257. Source: OSTI; NTIS (US Sales Only).

Results of compost chemical analyses with different parameters (pH, temperature, metal concentration, chemical dosage time, range of chemical input) for dry matter, nitrogen, phosphorous, potassium and COD, a mass balance of the outlined process and parameters of economy as regards input chemicals and capital costs, and a product evaluation of the upgraded organic fertilizer are presented in a synthetic way. (A.B.). 6 figs.

914 (EUR–14254, pp. 165-172) **Composts market studies and supply demand analysis.** Merillot, J.M. (ANRED, 49 - Angers (FR)). Commission of the European Communities, Luxembourg (Luxembourg). 1992. (CONF-9109436–: Workshop on Composting and Compost Quality Assurance Criteria, Angers (France), 11-13 Sep 1991). In *Composting and compost quality assurance criteria.* 433p. Order Number DE93721257. Source: OSTI; NTIS (US Sales Only).

Generally, composting involves organic matter recycling. To avoid the production of 'unused' composts and then to assure a sustainable recycling, marketing tools are necessary and very helpful. After having determined the specific production constraints of composting projects, the behaviour of potential users is analysed through marketing inquiries and conclusions are drawn for the conception and management policy of composting plants and on the role and strategies of public and private organizations for the development of an environmentally safe demand and use of waste-derived-composts. (author). 4 refs., 3 figs.

915 (EUR–14254, pp. 173-183) **Reference methods for analysis of composts.** Gaebriels, R. (Ornamental Crops Research Institute, Melle (BE)); Verdonck, O. Commission of the European Communities, Luxembourg (Luxembourg). 1992. (CONF-9109436–: Workshop on Composting and Compost Quality Assurance Criteria, Angers (France), 11-13 Sep 1991). In *Composting and compost quality assurance criteria.* 433p. Order Number DE93721257. Source: OSTI; NTIS (US Sales Only).

By establishing a reference method, used by all laboratories to analyze compost (end product), we will have a way not only for expressing the results on a common basis but also for evaluating the quality criteria when used as organic amendment or as a growing medium. This paper describes a proposed reference method with recommendations regarding the handling of the equipment, sample preparation and methods for physical and chemical characterization. (author). 5 figs.

916 (EUR–14254, pp. 184-187) **New standards and compost quality in the Federal Republic of Germany: the standards, the organisation for control, acceptance in practice.** Kehres, B. (Bundesverband der Deutschen Entsorgungswirtschaft (BDE), Koeln (DE)). Commission of the European Communities, Luxembourg (Luxembourg). 1992. (CONF-9109436–: Workshop on Composting and Compost Quality Assurance Criteria, Angers (France), 11-13 Sep 1991). In *Composting and compost quality assurance criteria.* 433p. Order Number DE93721257. Source: OSTI; NTIS (US Sales Only).

The separate collection and composting of biological waste from households, industry and local authorities is now state of the art in the Federal Republic of Germany. In setting up the German Quality Association for Composts (Bundesguetegemeinschaft Kompost e.V.), compost producers have joined together with the objective of assuring the quality of their products. High quality composts can be labelled with a registered quality symbol. The quality required of composts using this symbol, and the system of quality assurance are described. (author). 7 refs.

917 (EUR–14254, pp. 188-196) **Use of mineralization kinetics to estimate the agricultural value of organic fertilizers.** Cheneby, D. (Institut National de Recherches Agronomiques (INRA), 21 - Dijon (France)); Nicolardot, B. Commission of the European Communities, Luxembourg (Luxembourg). 1992. (CONF-9109436–: Workshop on Composting and Compost Quality Assurance Criteria, Angers (France), 11-13 Sep 1991). In *Composting and compost quality assurance criteria.* 433p. Order Number DE93721257. Source: OSTI; NTIS (US Sales Only).

The agricultural values of organic fertilizers can be estimated with laboratory mineralization kinetics. In contrast to physical and chemical determinations, laboratory incubations of organic fertilizers provide information on organic matter decomposition and on the availability of the most important elements such as nitrogen for example. These laboratory incubation techniques are also less time-consuming and less expensive than field experiments. Our experimental investigations concerned particle-size fractions of poplar bark composted with poultry droppings and on the other hand, mixtures of refuse compost and poultry droppings. (author). 11 refs., 2 figs., 4 tabs.

918 (EUR–14254, pp. 197-203) **In-vessel composting system and test of compost products for professional greenhouse growers.** Jespersen, L.M. Commission of the European Communities, Luxembourg (Luxembourg). 1992. (CONF-9109436–: Workshop on Composting and Compost Quality Assurance Criteria, Angers (France), 11-13 Sep 1991). In *Composting and compost quality assurance criteria.* 433p. Order Number DE93721257. Source: OSTI; NTIS (US Sales Only).

In the VJ-Center plant different solid and liquid organic waste products are treated hereby producing energy in the form of biogas from an anaerobic fixed film reactor and heat from an in-vessel heat composting plant. The heat is used in the plant for production of eel in a 100 t per year plant, and the organic waste products are converted into marketable products, among other horticultural substrates based on compost and peat, which are to be tested in

different greenhouse cultures in a greenhouse at the plant. (author). 2 refs., 1 fig., 3 tabs.

919 (EUR–14254, pp. 204-226) **Results of experimental work on composts and their quality in relation to plant growth and environmental standards.** Smith, S.R. (Water Research Association, Medmenham (United Kingdom)); Hall, J.E. Commission of the European Communities, Luxembourg (Luxembourg). 1992. (CONF-9109436–: Workshop on Composting and Compost Quality Assurance Criteria, Angers (France), 11-13 Sep 1991). In *Composting and compost quality assurance criteria.* 433p. Order Number DE93721257. Source: OSTI; NTIS (US Sales Only).

Two waste derived composts based on sewage sludge, liquid and dewatered sludges composted with straw, and one waste derived compost based on screened municipal solid wastes were compared with peat in a pot trial where the materials were mixed at five different levels with a sandy soil, with and without fertilizer, in which Petunia grandiflora were grown. Flower number was used as a measure of compost quality and was compared with shoot dry weight, nutrient, pH and conductivity of the growing media. Heavy metals concentrations were also controlled in plants. Results showed that all composts tested have potential value as growing media and that all were superior to peat. (A.B.). 32 refs., 11 figs., 2 tabs.

920 (EUR–14254, pp. 227-236) **Organic chemicals in compost: how relevant are they for the use of it.** Vogtmann, H. (Kassel Univ. (Gesamthochschule) (Germany)); Fricke, K. Commission of the European Communities, Luxembourg (Luxembourg). 1992. (CONF-9109436–: Workshop on Composting and Compost Quality Assurance Criteria, Angers (France), 11-13 Sep 1991). In *Composting and compost quality assurance criteria.* 433p. Order Number DE93721257. Source: OSTI; NTIS (US Sales Only).

The successful separate collection of biogenic wastes from households and municipalities has given rise to increased activities in composting. It is, however, of great importance to produce compost of highest quality to guarantee a wide range of applications of compost in plant production. An extensive survey was conducted to gain information about the status quo of biogenic waste composting in Germany. Data were obtained and statistically treated in various fields, such as construction of composting plants, composting techniques, with emphasis on organic chemicals as an important factor for compost quality. The results showed concentrations of CBP, PAK, PCDD and PCDF in compost lower than in forest soils, which should not restrict the use of biogenic waste compost in plant production. (author). 28 refs., 2 figs., 3 tabs.

921 (EUR–14254, pp. 237-248) **Transfer of inorganic pollution by composts.** Linieres, M. (Institut National de Recherches Agronomiques (INRA), 33 - Talence (France)). Commission of the European Communities, Luxembourg (Luxembourg). 1992. (CONF-9109436–: Workshop on Composting and Compost Quality Assurance Criteria, Angers (France), 11-13 Sep 1991). In *Composting and compost quality assurance criteria.* 433p. Order Number DE93721257. Source: OSTI; NTIS (US Sales Only).

The inorganic pollution of agricultural soils is to be expected from various kinds of organic fertilizers, especially from municipal solid wastes, by increasing the load of potentially toxic elements in the medium. Occurrence of mobile trace elements in household refuses is a major cause of the food chain contamination. Zinc, Copper, Boron, Lead and Mercury have been demonstrated to be the most bioavailable elements from conventional MSW. A great part of them can be eliminated by separate collection and sorting-composting techniques. However it remains that the trace element bioavailability has to be assessed in the only fermentable part of wastes. Finally, salinity excess and leachable nitrates are other pollution sources to be kept in mind, especially in the case of intensive and cumulative supplies of MSW. (author). 12 refs.; 1 fig., 7 tabs.

922 (EUR–14254, pp. 251-293) **United Kingdom waste management survey 1990-1991.** Searle, G. Commission of the European Communities, Luxembourg (Luxembourg). 1992. (CONF-9109436–: Workshop on Composting and Compost Quality Assurance Criteria, Angers (France), 11-13 Sep 1991). In *Composting and compost quality assurance criteria.* 433p. Order Number DE93721257. Source: OSTI; NTIS (US Sales Only).

A survey was conducted of all local authorities in the UK. Abstracts were prepared of those sections of each Waste Disposal Authority's Waste Management Plan lodged with the Department of the Environment which dealt with the reclamation of organic materials. By June 1991, 34 WMPs had been inspected and are reported here. The remainder will be reviewed as they are received. (author).

Commission of the European Communities, Luxembourg (Luxembourg). 1992. (CONF-9109436–: Workshop on Composting and Compost Quality Assurance Criteria, Angers (France), 11-13 Sep 1991). In *Composting and compost quality assurance criteria.* 433p. Order Number DE93721257. Source: OSTI; NTIS (US Sales Only).

The objective of this paper is to describe a rationale for compost standard development in the UK, which encompasses a range of points of view from producers, vendors, users and researchers. To achieve this a large group of professionals with an interest in composting has been consulted. This paper represents the majority consensus of opinions within the group; significant dissenting points of view are also included. The scope of the paper is the development of an approach to compost standards acceptable to as broad a range of producers, researchers and users as possible. (author). 35 refs., 3 tabs.

In *Composting and compost quality assurance criteria.* 433p. Order Number DE93721257. Source: OSTI; NTIS (US Sales Only).

Composting of organic waste materials is being adopted in Europe as a significant waste-treatment option. Certain countries have 'standards' by which to define acceptable composts. These standards vary both in their objective and in their scope. This paper reviews some of the existing standards, considers the activities of the national and international standard-setting organisations, describes the different types of standards available, and examines the differing requirements that need to be met by 'compost standards'. This text provides an overview of the means of and conditions for composting. It is intended to help in promoting the incorporation

of these treatment methods in waste disposal concepts as an integral part of waste management. In addition, it should provide useful information for those municipalities which are obliged to introduce composting under Land legislation governing waste disposal. (author). 6 figs.

928 (EUR–14254, pp. 402-406) **Composting: status of research and commercial production in Ireland.** Prasad, M. (Peat Research Centre, Newbridge (IE)). Commission of the European Communities, Luxembourg (Luxembourg). 1992. (CONF-9109436–: Workshop on Composting and Compost Quality Assurance Criteria, Angers (France), 11-13 Sep 1991). In *Composting and compost quality assurance criteria.* 433p. Order Number DE93721257. Source: OSTI; NTIS (US Sales Only).

Very little research has been carried out on composting in Ireland. Preliminary work has been carried out by the Peat Research centre on composting of fish and brewery waste and silage effluent with peat as bulking agent and using static and turned piles. The results from this work indicates that the composted product can be used as a soil amendment/fertilizer. Composting of spent mushroom compost (SMC) has been carried successfully by Kinsealy Research Centre using turned piles. The composted product was also suitable as a soil amendment/fertilizer. However, as an organic growing substrate it would need to be blended with peat to reduce EC. Composting on a commercial scale is being carried out mainly by three films in Ireland. The major waste used is dried cattle manure, SMC, chicken manure and straw. The quantities produced is relatively small and the products are sold mostly for soil amendment. Quality control is minimal and standards for compost quality has still to be determined in Ireland. (author). 5 ref., 2 tabs.

929 (Juel–2593) **Development of a pulsation drier for sewage sludge.** Glorius, T. Forschungszentrum Juelich GmbH (Germany). Inst. fuer Chemische Technologie; Technische Hochschule Aachen (Germany). Mar 1992. 125p. (In German). Order Number DE93720186. Source: OSTI; NTIS (US Sales Only).

The possibility of using hot pulsating flows for direct drying of sewage sludge was investigated in a pilot plant. A pulsation diver was developed which has a pulsed burner for flue gas generation with an evaporation capacity of 200-400 kg H_2 O/h, it is suited for small-scale to medium-scale sewage plants. Mechanically dewatered sewage sludge containing 25-35% of dry matter is concentrated to 70-90% dry matter in less than 10 minutes. The dry matter has a temperature of 80-100deg C and a mean particle diameter of 3-4 mm. The raw gas concentrations of dust, carbon and heavy metals in the drier emissions are near, or just above, the limiting values. They must be lowered by means of primary (air flow control) or secondary measures (exhaust purification); the noise level of about 90 db (A) must be lowered. (orig.).

930 (NEDO-ITE–9104) **Survey of an evaluation method for CO_2 reduction technology in the fossil fuel much-consuming industry field.** New Energy and Industrial Technology Development Organization, Tokyo (Japan). Mar 1992. 233p. (In Japanese). Sponsored by New Energy and Industrial Technology Development Organization, Tokyo (Japan). Order Number DE93723971. Source: OSTI; NTIS.

The method similar to inter-industry relations analysis is proposed to establish the method for making a quantitative evaluation of the effects of various technologies for CO_2 emission reduction measures in the fossil fuel much-consuming industry field. In the production process, a new concept, a cumulative CO_2 emission unit requirement (ϕ) is made an evaluation index. In each unit which composes the process, an in/out relationship of materials is expressed linearly, and it is supposed that the connection state between units is already known, and ϕ for raw materials and energy to be used and necessary expenses including equipment and personnel are given as initial conditions. Then, ϕ per product unit quantity can be calculated by the method similar to the inter-industry relations analysis. As basic data, the present situation of CO_2 emission and flow of materials/energy in the following four fossil fuel much-consuming industries are studied: electric power, cement, iron making and nonferrous metal smelting. As a result of trially applying the method of typical plants in the above-mentioned four industries in terms of the present technology and improved technology, validity of this evaluation method is confirmed and ϕ of each product can be calculated. 39 refs. 83 figs., 96 tabs.

931 (NEI-DK–957) **Biowaste'92: Proceedings.** Dansk Komite for Affald (DAKOFA), Copenhagen (Denmark). 1992 278p. (CONF-9206295–: 1. International conference and exhibition on biological waste treatment, Herning (Denmark), 1-4 Jun 1992). Order Number DE93721513. Source: OSTI; NTIS.

Sponsored by: ISWA and IAWPRC.

The papers presented at a conference on biowaste held in Herning, Denmark, on June 1-4, 1992, concern the management of municipal and other organic wastes by biodegradation. Various aspects of this subject are dealt with. Current national environmental policies tend to favour waste handling processes, such as biodegradation, which contribute to pollution abatement. The fuel methane is a product of biomass conversion, and this is another advantage of waste management by aerobic or anaerobic processes. (AB).

Sponsored by: ISWA and IAWPRC.

A large scale aerobic pile composting system, operated in a fully enclosed building, of which the first of its kind has been build in the city of Medemblik, is available for further implementation on a regional scale. The system is based on a thoroughly established technology. Moreover, a standard design has been developed, in which varations are possible according to the local situation. With this, not only can the policy driven rapid implementation of regional composting plants be realized, but also a type of composting plant can be brought into operation which is characterized by a large degree of reliability and flexibility in respect of the future capacity and compost quality. (au).

933 (NEI-DK–957, pp. 1-10) **Implications of site design and operational factors on optimisation of landfills as bioreactors.** Campbell, D.J.V. (Environmental Safety Centre, AEA Environment and Energy, Harwell, Didcot, Oxfordshire (GB)). Dansk Komite for Affald (DAKOFA), Copenhagen (Denmark). 1992. 278p. (CONF-9206295–: 1. International conference and exhibition on biological waste treatment, Herning (Denmark), 1-4 Jun 1992). In *Biowaste'92: Proceedings.* Order Number DE93721513. Source: OSTI; NTIS.

Sponsored by: ISWA and IAWPRC.

A landfill site has traditonally been seen as the final repository for receiving a wide variety of untreated or pretreated wastes, until recently, however, little attention has been paid to the numerous parameters that control the fate of those wastes following deposition, and which impact on biochemical degradation processes. In turn, little control has been evident to alleviate potential pollution threats caused by the liquid and gaseous end products of such processes. Improvements to landfilling standards have been brought about in recent years by the introduction of stricter legislation, and, improved enforcement standards. However, such changes are increasingly resulting in sites where indefinite waste storage is becoming the norm, rather than the ultimate and safe reassimilation of waste contaminants back into the environment. An alternative approach is to develop sites as bioreactors, whereby wastes of various compatible types, are allowed to degrade rapidly. This can only be achieved by the development of appropriate site design and operating procedures. The paper will focus on the need to permit various types of waste to be co-deposited, recognising the importance of this for ensuring the optimum conditions for moisture, temperature and pH control. The approach also provides for eventual controlled release of contaminants. It is acknowledged that some of the required operational practices are completely contrary to current guidance. For example, high moisture content is a neccessity for bioreactor optimisation, whereas current operational guidance requires minimisation of moisture ingress. (AB).

Sponsored by: ISWA and IAWPRC.

Opportunities for application of biological waste treatment systems to a variety of municipal, agricultural, and industrial wastes are reviewed within a global perspective. A survey of papers published or reviewed in selected journals between 1988 and 1991 was used as a primary resource to contrast aerobic and anaerobic wastewater treatment systems. Recent efforts associated with biodegradation of solid wastes in controlled systems, including landfills, are also summarized. (au) (32 refs.).

936 (NEI-DK–958) **General predictive control of energy systems.** Eksamensprojekt - IMSOR, 6/92. Bjerre, T. Technical Univ. of Denmark, Lyngby (Denmark). Inst. of Mathematical and Operations Research. 1992 188p. (In Danish). Order Number DE93721409. Source: OSTI; NTIS.

A GPC (General predictive control regulator) controller based on a timevarying ARMAX model is developed and implemented for simulation studies. Using a standard single-step-ahead parameter estimator gives no guarantee for good long range predictions. A multistep prediction error estimator is introduced as a dual of the control law. Estimation of periodic timevarying parameters in ARMAX models is discussed. The control weighing parameter in GPC is given a rubustification interpretation. For systems with unknown future setpoint, the GPC control law needs forecasting of the setpoint. Thus methods for forecasting the ambience temperature is considered. (au) (25 refs.).

937 (NEI-DK–960) **Dynamic modelling of individual components in substations.** Energiministeriets Energiforskningsprogram. Fjernvarme og produktion af el og varme. Poulsen, H. Danmarks Tekniske Hoejskole, Lyngby (Denmark). Lab. for Varme- og Klimateknik. Apr 1992 80p. (In Danish). Contract ENS-1323/89-12. Order Number DE93721468. Source: OSTI; NTIS.

EFP-89.

Dynamic and static models of typical components of substations in connection with larger district heating systems are introduced. Components dealt with are heat exchangers, plate heat exchangers, tube and shell heat exchangers, tubes, accumulator tanks, temperature sensors, valves and controllers (P, PI, PD and PID). These are analysed and described mathematically in order to facilitate modelling by different tools for dynamic simulation. The programme package DYSIM is used. There is a small but constant deviation (less than 5%) between measured and simulated temperatures. The models are evaluated. (AB) (15 refs.).

938 (NEI-DK–961) **Improvement of existing district heating substations.** Energiministeriets Energiforskningsprogram. Fjernvarme og produktion af el og varme. Poulsen, H. Danmarks Tekniske Hoejskole, Lyngby (Denmark). Lab. for Varme- og Klimateknik. Apr 1992 90p. (In Danish). Contract ENS-1323/89-12. Order Number DE93721427. Source: OSTI; NTIS.

EFP-89.

Danish district heating systems typically supply multistory buildings connected to the system by a substation. Some substations were studied thermodynamically and on-line measurements of temperature and flow were carried out. Substations are often equipped with a pressure difference compensator to ensure constant pressure to a central heating system. The compensator should be placed so that it can regulate the total system. It can be connected to the district heating system by a heat exchanger system to produce a constant pressure on the regulation valves, which gives a steady regulation of the hot water system. A cascade regulation of the tap water temperature is also recommended. Accumulator tanks with inlet at the bottom and outlet at the top, (in association with heat exchangers) should be dimensioned according to the time of the electrolysis treatment. Cold water should be preheated so that the cooling of the district heating water is optimized. Suggestions as to positioning of pump and inlets to tanks are illustrated by diagrams. Tap water systems with heat transfer inside the accumulator tank should be placed vertically. Optimization of cooling can be achieved by the use of two accumulator tanks with cold water preheated in the first and then entering at the bottom of the second tank, and where circulation enters this second tank between the top and the heating spiral. Dimensions of the regulating valve should be small in hot water systems consisting of only one heat exchanger without an accumulator tank. (AB).

939 **Recycling system.** Vandervalk, J.H. 12 Jun 1992. Filed date 20 Mar 1992. Canada Patent patent application 2063613. 22p. Source: Micromedia Ltd., Technical Information Centre, 165 Hotel de Ville, Place du Portage, Phase 2, Hull, Quebec, Canada J8X 3X2. Prices: PC $6.00 CAN; MF $4.00 CAN.

An apparatus and method are provided for processing materials to be recycled. The materials are sorted and retained in individual bins. The apparatus includes a receiving station for receiving the individual bins; a material transporting device having a pair of opposed ends; and a dumping station in cooperative association with the receiving station and one end of the material transporting device. The dumping station is adapted to receive the individual bins of material and dump the material from the individual bins onto the material transporting device. A plurality of separate storage containers are provided and positioned at the other end of the material transporting device. The material transporting device is movable to be placed in cooperative engagement with a selected one of the plurality of storage containers. 2 figs.

Princeton Univ., NJ (United States). Dept. of Mechanical and Aerospace Engineering. [1989]. 20p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AS04-86AL33209. Order Number DE93000644. Source: OSTI; NTIS; GPO Dep.

Laser Doppler velocimetry has been used to make cycle-resolved velocity and turbulence measurements in a homogeneous-charge, spark-ignition engine. The engine had a ported intake and disc-shaped chamber with a compression ratio of 8 to 1. It was operated at a speed of 1200 rpm and with a TDC swirl number of 4. A stoichiometric propane-air mixture was used, and ignition was near the wall. The velocity measurements were made at three spatial locations at the midpoint of the clearance height. Tests were made to determine whether the presence of the flame affected the accuracy of the velocity measurements. It was found that the ensemble-averaged mean velocity shows a small deviation, and the rms fluctuation intensity is significantly influenced, but the effects appear to be confined to the flame zone. Data rates were sufficiently high in the preflame and postflame regions to determine the velocity history in each cycle (cycle

resolved) . The cycle resolved turbulence intensity was found to increase across the flame. The turbulence intensity in the burned gas was found to be homogeneous at the three spatial locations examined and to decay rapidly. There was little or no increase in turbulence intensity ahead of the flame.

941 (DOE/ER/12115–2) **The railplug: Development of a new ignitor for internal combustion engines: Annual report, January 16, 1992–January 15, 1993.** Matthews, R.D.; Nichols, S.P.; Weldon, W.F. Texas Univ., Austin, TX (United States). Oct 1992. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG05-91ER12115. Order Number DE93003068. Source: OSTI; NTIS; GPO Dep.

The railplug project is essentially divided into three main tasks: (1) Railplug System Development, (II) Application of Railplugs to Engines, and (III) Railplug Durability. Railplug system development is subdivided into two categories: power supply development and ignitor development. In addition to these two categories, there is also a significant amount of work in progress to standardize the evaluation techniques used to measure railplug system performance. These issues are described below. The railplug requires a high voltage spike to breakdown the gap between the rails followed by some sustained voltage to drive the arc down the rails. The power supply chosen is a parallel circuit supply. The parallel circuit utilizes a high voltage (~20 kV) ignition coil in parallel with relatively low voltage (<600 V) capacitors to supply the breakdown and follow-on energies to the plug. The capacitors are charged off of line voltage while an automotive battery and opening switch provide the input to the ignition coil. The circuit is simple, inexpensive, and reliable, but has the drawback of requiring a high voltage diode to isolate the low voltage capacitors from the high voltage impulse. This is not really a single element, but rather consists of many diodes serially connected to achieve a high stand-off voltage. It has a limited average current rating, which means that high rep rates (>~30 Hz) are currently not attainable. The diode also consumes significant amounts of energy. This power supply has consistently discharged railplugs at pressures up to 500 psig.

942 (DTH-LET-RE–92-1) **Natural gas, fuel for a dual-fuel motor.** Energiministeriets Energiforskningsprogram. Miljoe og restprodukter. Frederiksen, P.; Kofoed, E. Danmarks Tekniske Hoejskole, Lyngby (Denmark). Lab. for Energiteknik. Jun 1992. 70p. (In Danish). Contract ENS-1323/88-8. Order Number DE93721476. Source: OSTI; NTIS.

EFP-88.

Measurements were taken in relation to a dual-fuel motor. The motor was a diesel motor with direct fuel injection. The maximum output was 50 kW at 4000/m. Tests showed that this motor could be used as a dual-fuel motor without reduction of the compression ratio, and with no change in maximum output or efficiency in relation to using diesel fuel alone. Exhaust temperature was also the same. The knocking risk judged in relation to acceleration in pressure sequence during combustion was found to be less in the the case of the dual-fuel motor operation. Considerations with regard to emission of NO_x only allow reduced load and operation when the figure for surplus air is 1.8. CO emission under all conditions exceeds the allowed limits. Emission of unburnt hydrocarbons is relatively high, and dependent on the amount of diesel oil used. After-treatment of the exhaust gas is necessary in order to reduce pollutant emission to the accepted standards. (AB).

943 (ORNL/Sub–83-21322/02) **Abrasive wear by coal-fueled diesel engine and related particles.** Ives, L.K. (National Inst. of Standards and Technology, Gaithersburg, MD (United States)). Oak Ridge National Lab., TN (United States); National Inst. of Standards and Technology, Gaithersburg, MD (United States). Sep 1992. 65p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400 ;AI05-83OR21322. (NISTIR–4811). Order Number DE93000834. Source: OSTI; NTIS; GPO Dep.

The development of commercially viable diesel engines that operate directly on pulverized coal-fuels will require solution to the problem of severe abrasive wear. The purpose of the work described in this report was to investigate the nature of the abrasive wear problem. Analytical studies were carried out to determine the characteristics of the coal-fuel and associated combustion particles responsible for abrasion. Laboratory pinon-disk wear tests were conducted on oil-particle mixtures to determine the relationship between wear rate and a number of different particle characteristics, contact parameters, specimen materials properties, and other relevant variables.

3302 External Combustion Engines

944 **Engine system using refrigerant fluid.** Robar, S.; Fraser, D.; Wiley, B. 1 Jul 1992. Filed date 31 Dec 1990. Canada Patent patent application 2033462. 25p. Source: Micromedia Ltd., Technical Information Centre, 165 Hotel de Ville, Place du Portage, Phase 2, Hull, Quebec, Canada J8X 3X2. Prices: PC $6.00 CAN; MF $4.00 CAN.

An engine system using refrigerant fluid is capable of utilizing the heat produced by an external high-efficiency hydrocarbon fuel combustion process. The heat from that process is utilized to transform the refrigerant fluid from a liquid state to a gaseous state in a cycle which includes extracting work from the fluid in the gaseous state in a high compression ratio piston engine. The cycle further includes transforming the fluid in the gaseous state back to the liquid state in a condenser, and then feeding that fluid under pressure to a heating chamber where the combustion process heat again returns it to the gaseous state at high pressure and temperature. The engine system has a higher efficiency than hydrocarbon fuel combustion engines, and has particular application to use in automobiles. One preferred refrigerant fluid for this engine system is 2,2,dichloro-1,1,1,trifluoro-ethane. 6 figs.

945 (CONF-9210152–2) **Oil performance in a methanol-fueled vehicle used in severe short-trip service.** West, B.H.; McGill, R.N. Oak Ridge National Lab., TN (United States). [1992]. 15p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From 1992 Society of Automotive Engineers (SAE) international fuels and lubricants meeting and exposition; San Francisco, CA (United States); 19-22 Oct 1992. Order Number DE92041264. Source: OSTI; NTIS; GPO Dep.

A methanol and a gasoline vehicle were each subjected to testing under severe short-trip driving conditions. Results show that the cool oil sump temperatures caused more fuel and water to collect in the oil of the methanol vehicle. Protective properties of both vehicles' oils degraded during short trips but rebounded somewhat during a subsequent long trip. Slightly warmer sump temperatures in longer short-trip driving resulted in no methanol dilution in the methanol vehicle's oil, and higher total volatiles contamination in the gasoline vehicle's oil. Freeway driving following the longer short trips promoted less rebound in the degraded oils' protective properties.

946 (DOE/CE–0362P) **Alternative fuel vehicles for the Federal fleet: Results of the 5-year planning process: Executive Order 12759, Section 11.** USDOE Assistant Secretary for Conservation and Renewable Energy, Washington, DC (United States). Aug 1992. 81p. Sponsored by USDOE, Washington, DC (United States). Order Number DE92040587. Source: OSTI; NTIS; GPO Dep.

This report describes five-year plans for acquisition of alternative fuel vehicles (AFVs) by the Federal agencies. These plans will be used to encourage Original Equipment Manufacturers (OEMs) to expand the variety of AFVs produced, reduce the incremental cost of AFVs, and to encourage fuel suppliers to expand the alternative fuel infrastructure and alternative fuel availability. This effort supplements and extends the demonstration and testing of AFVs established by the Department of Energy under the alternative Motor Fuels Act of 1988.

947 (IAEA-INFCIRC–410) **Declaration by the governments of Argentina, Brazil and Chile on the entry into force for them of the treaty of Tlatelolco.** International Atomic Energy Agency, Vienna (Austria). 21 Sep 1992. 2p. Order Number DE93606007. Source: OSTI; NTIS (US Sales Only); INIS.

Hard copies are available in English, French, Russian and Spanish from IAEA Div. of Publications, Distribution Unit.

The document reproduces the text of a declaration by the Governments of Argentina, Brazil and Chile on the entry into force for them of the Treaty for the Prohibition of Nuclear Weapons in Latin America (Treaty of Tlatelolco), made on 26 August 1992 at the VII Special Session of the Agency for the Distribution of Nuclear Weapons in Latin America (OPANAL), held in Mexico City.

3502 Proliferation

948 (DOE/DP/50081–T1) **Prospects for nuclear proliferation rollback: Seminar report.** Yager, J.A. Science Applications International Corp., McLean, VA (United States). 14 Aug 1992. 13p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC01-92DP50081. Order Number DE92040913. Source: OSTI; NTIS; GPO Dep.

On July 22, 1992, the Department of Energy's Office of Arms Control and Nonproliferation sponsored a seminar on prospects for nuclear proliferation rollback. The seminar focused on prospects for nuclear rollback in South Asia and the Middle East. Problems that may exist after rollback were also discussed. This report presents information on: factors involved in rollback decisions, prospects for nuclear rollback in South Asia and the Middle East, and post-rollback problems.(JDB)

3503 Verification

949 (CANADA–93000365) **Bibliography on Arms Control verification, 1962–1991.** Department of External Affairs and International Trade, Ottawa, ON (Canada). Non-Proliferation, Arms Control and Disarmament Div. Oct 1991. 250p. Source: OSTI.

This Bibliography lists alphabetically by author over 1500 documents related to arms control verification. These documents include the publications and submissions of governments and international organizations as well as the academic literature on the subject. Each document has been assigned a number of subject keywords describing its contents. A thesaurus of these keywords is included. Subject access to the documents contained in the Bibliography is provided through an index of these keywords.

950 (SAND–92-1599C) **The detection of organophosphonates by polymer films on a surface acoustic wave device and a micromirror fiber optic sensor.** Hughes, R.C.; Ricco, A.J.; Butler, M.A.; Pfeifer, K.B. Sandia National Labs., Albuquerque, NM (United States). [1992]. 15p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. (CONF-9207150–1: US-Japan seminar on microfabrication of biosensors, Anchorage, AK (United States), 21-24 Jul 1992). Order Number DE92040964. Source: OSTI; NTIS; GPO Dep.

There is a need for sensitive detection of organophosphonates by, inexpensive, portable instruments. Two kinds of chemical sensors, based on surface acoustic wave (SAW) devices and fiber optic micromirrors, show promise for such sensing systems. Chemically sensitive coatings are required for detection and data for thin films of the polymer polysiloxane are reported for both kinds of physical transducers. Both kinds of sensor are shown to be capable of detecting concentrations of diisopropylmethylphosphonate (DIMP) down to 1 ppM.

951 (ANL/CP–76266) **Magneto-optic characterizations of superlattices and wedged sandwiches with oscillatory interlayer magnetic coupling.** Bader, S.D. Argonne National Lab., IL (United States). Jul 1992. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-920762–6: International conference on the physics of transition metals, Darmstadt (Germany), 20-24 Jul 1992). Order Number DE93000607. Source: OSTI; NTIS; GPO Dep.

Three examples of magnetic coupling across metallic spacer layers are considered. Fe/Nb sputtered superlattices are observed to have as many as five antiferromagnetic oscillations, but a weak magnetoresistive anomaly. Epitaxial trilayers of Fe/Mo/Fe grown on Mo(100) and Co/Cu/Co grown on Cu(100) are observed to have short- and long-period oscillations, respectively. The trilayers are grown with wedged spacer layers and characterized in-situ by means of the magneto-optic Kerr effect.

952 (ANL/CP–76413) **Chemical probes of metal cluster structure–Fe, Co, Ni, and Cu.** Parks, E.K.; Zhu, L.; Ho, J.; Riley, S.J. Argonne National Lab., IL (United States). [1992]. 14p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-920921–1: 6. international symposium on small particles and inorganic clusters, Chicago, IL (United States), 16-22 Sep 1992). Order Number DE92041109. Source: OSTI; NTIS; INIS; GPO Dep.

Chemical reactivity is one of the few methods currently available for investigating the geometrical structure of isolated transition metal clusters. In this paper we summarize what is currently known about the structures of clusters of four transition metals, Fe, Co, Ni, and Cu, in the size range from 13 to 180 atoms. Chemical probes used to determine structural information include reactions with $H_2(D_2)$, H_20, NH_3 and N_2. Measurements at both low coverage and at saturation are discussed.

953 (ANL/CP–76999) **The evolution of electronic structure in Al_nCo_m.** Menezes, W.J.C.; Knickelbein, M.B. Argonne National Lab., IL (United States). 16 Sep 1992. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-920921–2: 6. international symposium on small particles and inorganic clusters, Chicago, IL (United States), 16-22 Sep 1992). Order Number DE92040737. Source: OSTI; NTIS; GPO Dep.

The ionization potentials of Al_nCo_m have been bracketed using laser photoionization mass spectrometry. We find that the electronic shell structure observed in the ionization potentials of Al_n by Whetten and coworkers [Phys. Rev. Letters 64, 2539 (1990)] is largely preserved for Al_nCo and Al_nCO_2, and is consistent with cobalt contributing one electron to the conduction band of the cluster. However, with increasing number of cobalt atoms, this simple model breaks down; all vestiges of aluminum cluster electronic shell structure are absent for $m > 4$.

954 (ANL/CP–77178) **Spin structures of Fe/Gd and Fe/Cr multilayers determined by polarized neutron reflectometry.** Loewenhaupt, M. (Forschungszentrum Juelich GmbH (Germany). Inst. fuer Festkoerperforschung); Hahn, W.; Huang, Y.Y.; Felcher, G.P.; Parkin, S.S.P. Argonne National Lab., IL (United States). Aug 1992. 15p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-9209227–2: Symposium on magnetic ultrathin films, multilayers, and surfaces, Lyon (France), 7-10 Sep 1992). Order Number DE93000510. Source: OSTI; NTIS; INIS; GPO Dep.

Polarized neutron reflection was used to determine the magnetic structure of two different antiferromagnetically coupled multilayer systems, Fe/Gd and Fe/Cr. In Fe/Gd, the Fe and Gd moments are coupled antiparallel at the interface. At low temperatures a surface

induced magnetic phase transition was found. In Fe/Cr, annealing at temperatures of up to 425°C, resulted in the degrading of antiferromagnetic coupling between Fe layers and in the formation of ferromagnetically coupled regions.

955 (ANL/MSD/CP–77632) **Orientational phase transitions in alloys.** Sabougni, M.L.; Johnson, G.K.; Price, D.L. Argonne National Lab., IL (United States). 22 Sep 1992. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-9206202–3: NATO advanced study institute on statics and dynamics of alloy phase transformations, Rhodes (Greece), 21 Jun - 3 jul 1992). Order Number DE93001702. Source: OSTI; NTIS; GPO Dep.

Plastic crystal behavior is observed in semiconducting CsPb and NaSn at high temperature (600 and 500 C, respectively). This behavior is associated with M_4^{4-} or A_4M_4 structural units orientationally disordering about 50 C below the melting point where translational disorder sets in. This orientational disorder is different in the two phases, exhibiting jump reorientations in CsPb and a more isotropic behavior in NaSn. In other Zintl compounds such as KPb, there is a single melting point where orientational and translational disorder sets in simultaneously; the classification of the different Zintl compounds into these two different kinds of behavior will require calorimetry or neutron diffraction below the melting point. (DLC)

956 (BARC–1991/E/011) **Chemical cleaning, decontamination and corrosion.** Gadiyar, H.S. (Bhabha Atomic Research Centre, Bombay (India). Metallurgy Div.); Das Chintamani; Gaonkar, K.B. Bhabha Atomic Research Centre, Bombay (India). 1991. 21p. Order Number DE93605303. Source: OSTI; NTIS (US Sales Only); INIS.

Chemical cleaning of process equipments and pipings in chemical/petrochemical industries is necessitated for improving operation, for preventing premature failures and for avoiding contamination. In developing a chemical formulation for cleaning equipments, the important aspects to be considered include (i) effective removal of corrosion products and scales, (ii) minimum corrosion of the base metal, (iii) easy to handle chemicals and (iv) economic viability. As on date, a wide variety of chemical formulations are available, many of them are either proprietory or patented. For evolving an effective formulation, knowledge of the oxides of various metals and alloys on the one hand and acid concentration, complexing agents and inhibitors to be incorporated on the other, is quite essential. Organic acids like citric acid, acetic acid and formic acid are more popular ones, often used with EDTA for effective removal of corrosion products from ferrous components. The report enumerates some of the concepts in developing effective formulations for chemical cleaning of carbon steel components and further, makes an attempt to suggest simple formulations to be developed for chemical decontamination. (author). 6 refs., 3 fi gs., 4 tabs.

957 (BARC–1991/E/017) **Pulsed laser photoacoustic spectrometer for study of solid materials.** Patel, N.D. (Bhabha Atomic Research Centre, Bombay (India). Spectroscopy Div.); Kartha, V.B. Bhabha Atomic Research Centre, Bombay (India). 1991. 17p. Order Number DE93605290. Source: OSTI; NTIS (US Sales Only); INIS.

The technique of photoacoustic spectroscopy has wide applications bacause it is extremely sensitive, and can be used to obtain spectra in wide spectral range for solids, liquids, gases, solutions, crystals etc. which may be usually difficult by conventional methods. For studying a variety of materials, a pulsed laser photoacoustic spectrometer has been set up in the laboratory. The report discusses the design and performance of the instrument. Some of the spectra of materials like Nd_2O_9 powder, Nd-YAG crystal, $CoCl_2$ $6H_2O$ etc. are shown. A detailed discussion on assignment of the spectra of Nd-YAG is also presented. (author). 4 refs., 5 figs., 1 tab.

958 (CEA-CONF–10998) **Mu SR study of magnetic properties in hydrided $ZrMn_2$.** Baudry, A. (CEA Centre d'Etudes de Grenoble, 38 (France). Dept. de Recherche Fondamentale sur la Matiere Condensee); Boyer, P.; Pontonnier, L.; Miraglia, S.; Harris, W.; Ferreira, L.P. CEA Centre d'Etudes de Grenoble, 38 (France). Direction des Sciences de la Matiere. 1992. 7p. (CONF-9206175–: Interaction symposium on metal-hydrogen systems, Uppsala (Sweden), Jun 1992). Order Number DE93721107. Source: OSTI; NTIS (US Sales Only); INIS.

MuSR measurements in zero field were performed in $ZrMn_2$ and $ZrMn_2H_{3.2}$. The results confirm the existence in the hydride of a sluggish, spin-glass type magnetic transition. The dependence on temperature of the asymmetry of the muon desintegration shows that magnetic ordering begins to take place around 180K, and suggests the existence of clusters of ordered Mn moments. Relaxation effects attributed to fluctuations of clustered magnetic moments are observed in the range 100K-190K.

959 (CEA-CONF–11005) **Microstructural evolution of ferritic-martensitic steels irradiated in the fast breeder reactor Phenix.** Dubuisson, P.; Gilbon, D.; Seran, J.L. CEA Centre d'Etudes Nucleaires de Saclay, 91 - Gif-sur-Yvette (France). Direction des Technologies Avancees. 1992. 20p. (CONF-920970–: 3. conference on evolution of microstructure in metals during irradiation, Minett (Canada), 29 Sep - 2 oct 1992). Order Number DE93721679. Source: OSTI; NTIS (US Sales Only); INIS.

This paper deals with the microstructural evolution of a 17Cr ferritic steel (F17) and five stabilized (EM12, FV448, HT9 and 1.4914) or unstabilized (EM10) 9-12Cr ferritic-martensitic steels irradiated in Phenix. The TEM examinations performed on these steels show that their microstructures are only modified by irradiation at low temperature (T<500 deg C). Few voids are generally observed, leading to swelling values close to zero, except in duplex EM12 and ferritic F17 steels. On the other hand, fine and uniform precipitation is induced by irradiation in alloys that contain either more than 13%Cr (α'), either more than 0.3%Ni (M_6C) or ≈2% Mo (χ). This precipitation is mainly responsible for radiation-induced embrittlement which depends both on number density and nature of particles, α' being more detrimental than M_6C or χ. (author). 40 refs., 8 figs., 4 tabs.

960 (CEA-CONF–11035) **Oxide dispersion strengthened ferritic alloys obtained by mechanical alloying: effects of processing on textures and tensile properties.** Alamo, A.; Regle, H.; Bechade, J.L. CEA Centre d'Etudes de Saclay, 91 - Gif-sur-Yvette (France). Dept. de Technologie des Materiaux. 1992. 15p. (CONF-9206195–: 1992 powder metallurgy world congress, San Francisco, CA (United States), 21-26 Jun 1992). Order Number DE93721680. Source: OSTI; NTIS (US Sales Only); INIS.

Textures and tensile properties of two oxide dispersion strengthened (ODS) ferritic alloys (Incoloy MA956 and MA957) obtained by mechanical alloying have been studied as a function of processing. Materials analysed are Fe-based alloys containing 14 and 20%Cr strengthened by yttrium oxide distribution. The object of this paper is to determine the metallurgical and mechanical properties of rod samples obtained by hot extrusion, cold-drawing and swaging. The effect of heat treatments is also discussed. (A.B.). 9 refs., 8 figs., 1 tab.

961 (CEA-CONF–11037) **Tensile and Charpy properties of ferritic-martensitic wrapper steels irradiated in Phenix.** Levy, V.; Fissolo, A.; Dubuisson, P. CEA Centre d'Etudes Nucleaires de Saclay, 91 - Gif-sur-Yvette (France). Direction des Technologies Avancees. 1992. 12p. (CONF-9206296–: Specialist Meeting on Cladding and Wrapper Materials, Obninsk (Russian Federation), 7-14 Jun 1992). Order Number DE93721682. Source: OSTI; NTIS (US Sales Only); INIS.

Mechanical properties (tensile and impact strength) on a ferritic steel F17 wrapper (hexagonal tube) and on a ferritic-martensitic steel EM12 irradiated in Phenix are presented. Results show that up to the higher doses investigated (97,3 dpaNRT), the ductile brittle transition temperature remains always below room temperature, and the tensile properties are compatible with their use as wrapper in fast breeder reactors. (A.B.). 8 figs.

962 (CEA-CONF–11038) **Swelling irradiation creep and mechanical properties of Ti-stabilized austenitic steels irradiated as Phenix fuel pins.** Seran, J.L. (CEA Centre d'Etudes Nucleaires de Saclay, 91 - Gif-sur-Yvette (France). Direction des Technologies Avancees); Maillard, A.; Fissolo, A.; Touron, H.; Royer, J.; Martella, T.; Ehrlich, K. CEA Centre d'Etudes Nucleaires de Saclay, 91 - Gif-sur-Yvette (France). Direction des Technologies

Avancees. 1992. 19p. (CONF-9206296–: Specialist Meeting on Cladding and Wrapper Materials, Obninsk (Russian Federation), 7-14 Jun 1992). Order Number DE93721683. Source: OSTI; NTIS (US Sales Only); INIS.

Results of dimensional stability and of mechanical behavior of two Ti stabilized austenitic steels (316 and 15Cr-15Ni or AIM1) irradiated up to 115 dpa show a swelling resistance, higher mechanical properties and higher structural stability for 15-15Ti. (A.B.). 5 refs., 13 figs.

963 (CEA-CONF–11039) **Improvement of austenitic steels for cladding applications: the advanced austenitics, out of pile tests and first post-irradiation results.** Seran, J.L. (CEA Centre d'Etudes de Saclay, 91 - Gif-sur-Yvette (France). Dept. de Technologie des Materiaux); Alamo, A.; Dubuisson, P.; Martella, T.; Courcon, P. CEA Centre d'Etudes de Saclay, 91 - Gif-sur-Yvette (France). Dept. de Technologie des Materiaux. 1992. 22p. (CONF-9206296–: Specialist Meeting on Cladding and Wrapper Materials, Obninsk (Russian Federation), 7-14 Jun 1992). Order Number DE93721684. Source: OSTI; NTIS (US Sales Only); INIS.

This paper describes the out of pile and the first post irradiation tests (hardness, tensile strength, creep and microstructure characterizations before or/and after ageing) obtained on several alloys under investigation, to characterize the potential improvement expected on advanced austenitic steels by a reduction of the Cr/Ni ratio from a solute modified or multi stabilized 15Cr-15Ni basis. (A.B.). 3 refs., 16 figs.

964 (CEA-CONF–11040) **Swelling and irradiation creep of ferritic martensitic steels for wrapper application irradiated in Phenix.** Levy, V. (CEA Centre d'Etudes de Saclay, 91 - Gif-sur-Yvette (France). Dept. de Mecanique et de Technologie); Maillard, A.; Touron, H.; Gilbon, D.; Martella, T.; Marinot, R.; Ehrlich, K. CEA Centre d'Etudes de Saclay, 91 - Gif-sur-Yvette (France). Dept. de Mecanique et de Technologie. 1992. 12p. (CONF-9206296–: Specialist Meeting on Cladding and Wrapper Materials, Obninsk (Russian Federation), 7-14 Jun 1992). Order Number DE93721685. Source: OSTI; NTIS (US Sales Only); INIS.

Results of swelling and irradiation creep of F17 ferritic unstabilized steel, of 9CrNbV duplex ferritic martensitic steel and of two martensitic steels (french EM 10 and german DIN 1.4914) show that the best behaviour is obtained on fully martensitic steels for a maximum dose of 147 dpaNRT. (A.B.). 10 figs., 1 tab.

965 (CFFTP-G–9046) **Corrosion of nickel and stainless steels in concentrated lithium hydroxide solutions.** Graydon, J.W. (Toronto Univ., ON (Canada). Dept. of Chemical Engineering and Applied Chemistry); Kirk, D.W. Canadian Fusion Fuels Technology Project, Toronto, ON (Canada). Jun 1990. 35p. Order Number DE93603347. Preprint of a paper submitted to Corrosion.

The corrosion behaviour of four alloys in 3 and 5 mol/L lithium hydroxide solutions under a hydrogen atmosphere at 95 degrees C was investigated. Corrosion of Nickel 200 and the stainless steels 316, 316L, and E-Brite 26-1 was assessed in two sets of immersion tests lasting 10 and 136 days. Corrosion rates were determined by weight loss, susceptibility to stress corrosion cracking was evaluated using U-bends, and the details of the corrosion process were studied on specimens with a mirror finish using light and electron microscopy, x-ray spectrometry and mapping, and x-ray diffraction. The long term corrosion rates were low for all alloys (< 4 μm/y) and no stress corrosion cracking was observed. The corrosion products on the stainless steels were a thin continuous layer of chromium oxide that provided the passivating protection and well-formed crystals that precipitated from solution onto this layer. The crystals were identified as α-$LiFeO_2$, β-$LiFeO_2$, and a very iron-rich β-$LiFe_5O_8$. The passivating layer on the nickel was $Ni(OH)_2$. The underlying metal corroded evenly except for the 316 stainless steels. These showed a uniform intergranular corrosion with minor drop-out of smaller grains likely because of segregation of impurities to the grain boundaries. The walls of these intergranular crevices were covered with a passivating layer of chromium oxide. (8 figs., 5 tabs., 11 refs.).

966 (CONF-891119–147) **A first-principles study of short range order in Cu-Zn.** Sluiter, M. (Lawrence Berkeley Lab., CA (United States)); Turchi, P.E.A.; Johnson, D.D.; Pinski, F.J.; Nicholson, D.M.; Stocks, G.M. Oak Ridge National Lab., TN (United States). [1989]. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400 ;W-7405-ENG-48 ;AC04-76DP00789. From Materials Research Society fall meeting; Boston, MA (United States); 27 Nov - 2 dec 1989. Order Number DE93001366. Source: OSTI; NTIS; INIS; GPO Dep.

Recently, measurements of short range order (SRO) neutron diffuse scattering intensity have been performed on quenched Cu-Zn alloys with 22.4 to 31.1 at.% Zn and pair interactions were obtained by Inverse Monte Carlo simulation. These results are compared to SRO intensities and effective pair interactions obtained from first-principles electronic structure calculations. The theoretical SRO intensities were calculated with the Cluster Variation Method in the tetrahedron-octahedron approximation with first-principles pair interactions as input. More generally, phase stability in the Cu-Zn alloy system are discussed, using ab-initio energetic properties.

967 (CONF-9206202–2) **The direct Monte Carlo method for calculating alloy phases.** Faulkner, J.S. (Florida Atlantic Univ., Boca Raton, FL (United States)); Horvath, E.A.; Wang, Yang; Stocks, G.M. Oak Ridge National Lab., TN (United States). [1992]. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400 ;FG05-89ER45392. From NATO advanced study institute on statics and dynamics of alloy phase transformations; Rhodes (Greece); 21 Jun - 3 jul 1992. Order Number DE93000436. Source: OSTI; NTIS; GPO Dep.

Theories exist for predicting the structure of an alloy on the assumption that the energy of the alloy can be obtained from an Ising model Hamiltonian. It is not necessary to introduce interatomic potentials if the Monte Carlo method is used for thermodynamics. δH is calculated directly from the electronic structure of the alloy using the embedded cluster method (ECM) of alloy theory. ECM is based on the coherent potential approximation (CPA) for the electronic states of random substitutional alloys. A version of the theory was developed within the context of the tight-binding model. Cray ymp calculations were made for a 50 - 50 Pd - Rh fcc alloy; electronic energies were obtained using an ECM based on KKR-CPA programs. The top of the miscibility gap is predicted to be at 1415 K. The order parameter vs T graph shows a critical temperature just above 1200 K. Calculations in the grand canonical mode are underway. The calculations are for the fcc lattice, but the bcc lattice is also considered. There are other methods, such as the Harris approximation, that will improve the energy calculations. 4 figs, 15 refs. (DLC)

968 (CONF-9210161–1) **Au(111) and Pt(111) surface phase behavior.** Sandy, A.R. (Massachusetts Inst. of Tech., Cambridge, MA (United States). Dept. of Physics); Mochrie, S.G.J.; Zehner, D.M.; Gruebel, G.; Huang, K.G.; Gibbs, D. Oak Ridge National Lab., TN (United States); Massachusetts Inst. of Tech., Cambridge, MA (United States). [1992]. 12p. Sponsored by USDOE, Washington, DC (United States); National Science Foundation, Washington, DC (United States). DOE Contract AC05-84OR21400 ;AC02-76CH00016. Grant DMR-9119675;Grant DMR-9022933. (CONF-9210162–1: 12. international vacuum congress; 8. international conference on solid surfaces, Hague (Netherlands); Hague (Netherlands), 12-16 Oct 1992; 12-16 oct 1992). Order Number DE92040881. Source: OSTI; NTIS; GPO Dep.

We describe our recent x-ray-scattering studies of the structure and phases of the clean Au(111) and Pt(111) surfaces. Below 0.65 of their respective bulk melting temperatures, the Au(111) surface has a well-ordered chevron reconstruction and the Pt(111) surface is unreconstructed. Above these temperatures, both surfaces reconstruct to form layers that are isotropically compressed and have only short-range order. Throughout their reconstructed phases, the densities of the Au and Pt (111) surfaces increase with increasing temperature.

969 (DOE/ER/12825–1) **Irradiation assisted stress corrosion cracking of austenitic stainless steels: Progress report, September 30, 1988–May 31, 1989.** Was, G.S.; Atzmon, M. Michigan Univ., Ann Arbor, MI (United States). Dept. of Nuclear Engineering. Jun 1989. 6p. Sponsored by USDOE, Washington,

DC (United States). DOE Contract FG07-88ER12825. Order Number DE92040989. Source: OSTI; NTIS; INIS; GPO Dep.

Initial part of the project involved the synthesis of samples for irradiation, and the design and construction of a heating stage for the accelerator target chamber. Effort was made to obtain a grain size of 10 μm. Etching conditions were determined for revealing the grain boundary structure; grain growth results for ultrahigh pure 304 SS with added sulfur are given. 3 figs. (DLC)

970 (DOE/ER/12825–2) **Irradiation-assisted stress corrosion cracking of austenitic alloys: Final report, October 1, 1988–August 31, 1991.** Was, G.S.; Atzmon, M. Michigan Univ., Ann Arbor, MI (United States). Dept. of Nuclear Engineering. [1991]. 39p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG07-88ER12825. Order Number DE92040988. Source: OSTI; NTIS; INIS; GPO Dep.

An experimental program has been conducted to determine the mechanism of irradiation-assisted stress-corrosion cracking (IASCC) in austenitic stainless steel. High-energy protons have been used to produce grain boundary segregation and microstructural damage in samples of controlled impurity content. The densities of network dislocations and dislocation loops were determined by transmission electron microscopy and found to resemble those for neutron irradiation under LWR conditions. Grain boundary compositions were determined by in situ fracture and Auger spectroscopy, as well as by scanning transmission electron microscopy. Cr depletion and Ni segregation were observed in all irradiated samples, with the degree of segregation depending on the type and amount of impurities present. P, and to a lesser extent P, impurities were observed to segregate to the grain boundaries. Irradiation was found to increase the susceptibility of ultra-high-purity (UHP), and to a much lesser extent of UHP+P and UHP+S, alloys to intergranular SCC in 288°C water at 2 ppm O_2 and 0.5 μS/cm. No intergranular fracture was observed in arcon atmosphere, indicating the important role of corrosion in the embrittlement of irradiated samples. The absence of intergranular fracture in 288°C argon and room temperature tests also suggest that the embrittlement is not caused by hydrogen introduced by irradiation. Contrary to common belief, the presence of P impurities led to a significant improvement in IASCC over the ultrahigh purity alloy.

971 (DOE/ER/12825–3) **Irradiation assisted stress corrosion cracking of austenitic stainless steels: Progress report, September 30, 1989–June 30, 1990.** Was, G.S.; Atzmon, M. Michigan Univ., Ann Arbor, MI (United States). Dept. of Nuclear Engineering. Jun 1990. 28p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG07-88ER12825. Order Number DE92040990. Source: OSTI; NTIS; INIS; GPO Dep.

Samples of ultra high purity stainless steel have been fabricated into 2mm x 2mm rectangular bars and irradiated to one dpa ($\sim$l x 10^{19} p^+/cm^2) using 3.4 MeV protons (>20μA) while controlling the sample temperature at 400°C. Samples are pressed onto a water-cooled and electrically heated copper block with a thin layer of Sn in between to improve thermal conductivity. The irradiation produced a significant prompt radiation field but sample activation was limited to β-decay and this decayed rapidly in less than 48 h. Samples were hydrogen charged and strained at slow rates at −30°C insitu in the Auger electron spectrometer to successfully fracture several samples intergranularly for grain boundary composition analysis. An ultra-high purity (UHP) alloy of Fe-19Cr-9Ni was irradiated to 1 dpa at 400C $\pm$ 5C and 7 x 10^{-9} torr in the tandem accelerator of the Michigan Ion Beam Laboratory, resulting in a dislocation network density of 1.8 x 10^9 cm^2 and a dislocation loop density of 7 x 10^{16} cm^{-3} along with the dissolution of small precipitates present in the unirradiated sample. EPR experiments on the UHP irradiated alloy showed no significant increase in charge passed upon reactivation, over an unirradiated sample experiencing the same thermal history. An SCC waterloop and autoclave system has been completed and a sample has been designed to measure the susceptibility of the irradiated microstructure as compared to the unirradiated microstructure.

972 (DOE/ER/45184–T1) **The role of grain boundary chemistry and structure in the environmentally-assisted intergranular cracking of nickel-base alloys: Progress report, August 1, 1991–July 31, 1992.** Was, G.S. Michigan Univ., Ann Arbor, MI (United States). Dept. of Nuclear Engineering. Jul 1992. 32p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-85ER45184. Order Number DE93003126. Source: OSTI; NTIS; GPO Dep.

Stress corrosion cracking tests in constant extension rate tensile (CERT) and constant load tensile (CLT) tests were conducted on Ni-xCr- 9Fe-yC in Ar, water, and a LiOH-boric acid solution. Cr and C improve the resistance of Ni-base alloys to IG cracking in both Ar and water at 360C. Since creep plays a role in IG cracking, one possible explanation for the role of the environment involves its effect on the creep. Experiments were conducted on the role of C in the deformation behavior and failure mode of Ni-16Cr-9Fe. Constant load experiments were conducted on Ni-16Cr-9Fe to determine if the CLT test is more aggressive than CERT. The electron backscattering technique in a SEM is being developed in order to extend the IG cracking studies to grain sizes typical of commercial alloys, 20-30 microns.

973 (DOE/ER/45229–27) **Study of mechanical behavior and internal structure of ferritic nanocrystalline material: Technical progress report, 1 August 1991–1 August 1992.** Weertman, J.R.; Murphy, W.P. Northwestern Univ., Evanston, IL (United States). Dept. of Materials Science and Engineering. Aug 1992. 14p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-86ER45229. Order Number DE92040858. Source: OSTI; NTIS; GPO Dep.

The research thrust of this grant has been directed into two areas. The principal effort has been spent in an investigation of the synthesis, mechanical behavior and internal structure of ferritic nanocrystalline material. A second effort involves a study of the high temperature behavior of several ferritic steels. In particular, we are investigating the precursors and earliest stages of fatigue crack initiation, especially how initiation is affected by hold times and by environment.

974 (DOE/ER/45253–7) **Potential modulation of equilibrium and excitation phenomena at the electrolyte-solid interface: Progress report, October 31, 1991–September 30, 1992.** Furtak, T.E. Colorado School of Mines, Golden, CO (United States). Dept. of Physics. Oct 1992. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-86ER45253. Order Number DE93001685. Source: OSTI; NTIS; GPO Dep.

Optical SHG (second harmonic generation) is well suited for interfacial studies and for probing the electrolyte-solid interface. A series of experiments were completed on Ag(001). The bulk isotropic (γ) and anisotropic (ζ) susceptibilities were determined and can be carried over to other Ag orientations. The only allowed surface susceptibility, $\chi(zxx)$, was negligible only as long as the surface was uncharged or negatively charged. To explain the results, a phenomenological model has been developed for four-field mixing; the static electrochemical field is a third "incoming field" (together with the two optical SHG fields) that mix via a third-order surface susceptibility. The potential-induced surface reconstruction on Ag(111), attributed last year to adsorbed sulfate ions, was studied further; the reproducibility problem in the trend toward the fully reconstructed surface continued to be found. Alternate explanations for the apparent symmetry change are being explored. The detection system on the surface Raman facility was improved. (DLC)

975 (DOE/ER/45308–6) **Novel concepts in weld science: Role of gradients and composite structure: Technical progress report, June 1, 1990–August 31, 1992.** Matlock, D.K.; Olson, D.L. Colorado School of Mines, Golden, CO (United States). Center for Welding and Joining Research. 31 Aug 1992. 17p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-87ER45308. (MT-CWJR–092-023). Order Number DE92040893. Source: OSTI; NTIS; GPO Dep.

The effects of compositional and microstructural gradients on weld metal properties were investigated. The effects of compositional gradients were analyzed using thermodynamic and composite models. Brittle and ductile cracking behavior were investigated using both binary alloy single crystals and large grain castings. In both cases, the crack propagated along regions where the compositional gradients were the steepest. High temperature deformation

of large wavelength compositonally modulated structures vas investigated to understand creep behavior in veld metal. At moderate temperatures, the creep behavior of cored materials was found to follow predictions based on the rule of mixtures composite analysis. At higher temperatures with the advent of dynamic mass transport the creep process is influenced by diffusion-promoted vacancy flow and time-dependent compositional gradient. The investigation found the critical gradient which will promote Kirkendall voids and has reported a creep rate behavior that suggests strong structural dependence, localized stress and vacancy transport influence. Weld metal, based on metal matrix composite, was also demonstrated.

976 (DOE/ER/45346–T1) **Deformation twinning in ordered alloys transformation induced ductility in intermetallics: Final report.** Goo, E. University of Southern California, Los Angeles, CA (United States). Dept. of Materials Science and Engineering. Sep 1992. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG03-88ER45346. Order Number DE93002879. Source: OSTI; NTIS; GPO Dep.

Intermetallics, which are ordered alloys, have excellent high temperature strength. Unfortunately a universal problem facing intermetallics is the lack of ductility. This program attempted to look at some novel solutions for enhancing ductility in intermetallics. Deformation twinning has been demonstrated in TiNi to be responsible for its ductility. This was a surprising result since twinning was not believed to occur readily in ordered alloys. Furthermore the twinning occurred on a (114) plane which had not been previously observed. Research into determining the mechanisms for twinning in ordered alloy and understanding how twinning enhances the ductility of intermetallic was studied. Martensitic transformations in many intermetallics also provides a possible means of enhancing ductility. The detwinning of martensite twins or transformation induced martensite provides a mechanism for accommodating large strains. It is known that a metastable martensitic phase may be created by quenching a non-stoichiometric NiAl alloy. This presents the potential of substantial ductility in NiAl. Investigation of the martensitic phase transformation and its effect on the ductility of NiAl alloys was investigated.

977 (DOE/ER/45414–T1) **Influence of point defects on grain boundary diffusion in oxides: [Annual report, July 1, 1990–March 1, 1992].** Stubican, V.S. Pennsylvania State Univ., University Park, PA (United States). Dept. of Materials Science and Engineering. 15 Mar 1991. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-90ER45414. Order Number DE93002864. Source: OSTI; NTIS; GPO Dep.

The influence of point defects on grain boundary diffusion of Co ions in NiO was studied using polycrystalline films and bicrystals. Grain boundary diffusion was studied at 750 C at oxygen partial pressure. Two diffusion regions were found. At low oxygen pressures, extrinsic diffusion was observed. Above oxygen pressure of 10^{-7}, influence of intrinsic point defects was detected. It was determined that grain boundary diffusion was > 3 orders of magnitude faster than volume diffusion. However, it seems that grain boundary diffusion is influenced by the point defects in a similar way as the volume diffusion. 4 figs.

978 (DPW–5420) **Trip report: Argonne National Laboratory, April 10, 1952.** Montenyohl, V.I. Du Pont de Nemours (E.I.) and Co., Wilmington, DE (United States). Explosives Dept. 30 Apr 1952. 3p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-76SR00001. (SR/H–227). Order Number DE93001460. Source: OSTI; NTIS (US Sales Only); GPO Dep.

In a meeting held to discuss the proposed corrosion testing program and its aims, Frank Foote indicated that both were reasonable, While the heat treatment yielding the maximum corrosion resistance if different from that which would be used for maximum dimensional stability, Foote felt that an improvement in dimensional stability by alloying would very likely show a parallel improvement in corrosion resistance; while it might not be possible to attain the maximum in corrosion resistance and the maximum in dimensional stability simultaneously in the same alloy system, there is no reason to fear that attainment of good corrosion resistance will be at the price of dimensional stability. Stability might not be at its maximum, but it still will be better than in natural uranium.

979 (DPW–5911) **Visit to the Los Alamos Scientific Laboratories radiography: Trip report.** McKeehan, M. Du Pont de Nemours (E.I.) and Co., Wilmington, DE (United States). Explosives Dept. 25 Jul 1952. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-76SR00001. (SR/H–211). Order Number DE93001238. Source: OSTI; NTIS (US Sales Only); GPO Dep.

This report discusses a visit to Los Alamos Scientific Laboratories at the University of California to determine the best values for the several parameters connected with x-radiography of aluminium welds. The report is dated July 25, 1952. (JL)

980 (ENEL-CRTN-G11–91-11) **Computer code for evaluation of creep and damage: Validation through experimental data.** Garzillo, A.; Meriggi, M.; Sampietri, C. Centro Informazioni Studi Esperienze (CISE), Milan (Italy); Ente Nazionale per l'Energia Elettrica, Milan (Italy). Centro Termica e Nucleare. 1991. 9p. Order Number DE93729476. Source: OSTI; NTIS (US Sales Only); INIS.

The two-dimensional finite element computer code AUDACE, for non-linear mechanical problems, is presented. This code was developed in order to analyze thermo-elasto-plastic and creep problems in the framework of continuum damage mechanics. The simulation of a large cylindrical pressure vessel with a fully circumferential crack was performed to check the capabilities of the code. The computed results are compared with the experimental ones. This work was carried out under an ENEL (Italian Electricity Board)-CISE collaboration programme.

981 (EUR–13647/III, pp. 733-758) **The use of lithium-bearing geothermal fluids for the industrial production of lithium.** Fouillac, C. (Bureau de Recherches Geologiques et Minieres (BRGM), 45 - Orleans (France)); Marabini, M.; Niccolini, M. Commission of the European Communities, Luxembourg (Luxembourg). 1992. In *Summary reports of the R and D programme: primary raw materials (1986-89) - Volume III.* 1046p. Order Number DE93720867. Source: OSTI; NTIS (US Sales Only); INIS.

In the french and italian geothermal aquifers actually in production or with a predicted development, an estimation is made of the lithium reserves. Data on water composition, and two methods of lithium extraction are presented (specific electrode and aluminium precipitation). (A.B.). 10 refs., 14 figs., 2 tabs.

982 (IGC–114) **Biennial activity report of metallurgy programme for 1987 and 1988.** Shanmugam, V.; Rao, B.P.C.; Bhanu Sankara Rao, K.; Muralidharan, P.; Bhaduri, A.K.; Kuppusami, P.; Shyamsunder, M.T.; Sampath, N.; Sreedharan, O.M. (eds.). Indira Gandhi Centre for Atomic Research, Kalpakkam (India). 1990. 459p. Order Number DE93605263. Source: OSTI; NTIS (US Sales Only); INIS.

The research and development (R and D) activities in the field of metallurgy at Indira Gandhi Centre for Atomic Research, Kalpakkam during 1987-1988 are reported in the form of individual summaries arranged under headings : (1) Mechanical Metallurgy Section, (2) Physical Metallurgy Section, (3) Chemical Metallurgy Section, (4) Materials Technology Section, (5) Division for PIE and NDT Development and (6) Quality Engineering Section. A list of publications by the staff scientists working in the field of metallurgy during report period is given in one of the appendices. (author). figs., tabs.

983 (IGC–119) **A review of hot cracking in austenitic stainless steel weldments.** Shankar, V.; Gill, T.P.S.; Mannan, S.L.; Rodriguez, P. Indira Gandhi Centre for Atomic Research, Kalpakkam (India). 1991. 83p. Order Number DE93605280. Source: OSTI; NTIS (US Sales Only); INIS.

The occurrence of hot cracking in austenitic stainless steel weldments is discussed with respect to its origin and metallurgical contributory factors. Of the three types of hot cracking, namely solidification cracking, liquation and ductility dip cracking, solidification cracking occurs in the interdendritic regions in weld metal while liquation and ductility dip cracking occur intergranularly in the heat-affected zone (HAZ). Segregation of impurity and minor elements such as sulphur, phosphorous, silicon, niobium, boron etc to form low melting eutectic phases has been found to be the major cause of hot cracking. Control of HAZ cracking requires minimisation of impurity elements in the base metal. In stabilized stainless steels containing niobium, higher amounts of delta-ferrite have been

found necessary to prevent cracking than in unstabilized compositions. Titanium compounds have been found to cause liquation cracking in maraging steels and titanium containing stainless steels and superalloys. In nitrogen added stainless steels, cracking resistance decreases when the solidification mode changes to primary austenitic due to nitrogen addition. A review of the test methods to evaluate hot cracking behaviour showed that several external restraint and semi-self-restraint tests are available. The finger Test, WRC Fissure Bend Test, the PVR test and the Varestraint Test are described along with typical test results. Hot ductility testing to reveal HAZ cracking tendency during welding is described, which is of particular importance to stabilized stainless steels. Based on the literature, recommendations are made for welding stabilized and nitrogen added steels, indicating areas of further work. (author). 81 refs., 30 figs., 1 tab.

984 (IGC–122) **Compatibility studies of AISI type 316 stainless steel with lead-lithium eutectic alloy.** Joseph, A.; Kasiviswanathan, K.V.; Raj, Baldev. Indira Gandhi Centre for Atomic Research, Kalpakkam (India). 1991. 71p. Order Number DE93605281. Source: OSTI; NTIS (US Sales Only); INIS.

Spent fuel subassemblies from the Fast Breeder Test Reactor (FBTR) are to be stored in leak tight cotainers until they are required to be sent for reprocessing. Use of advanced fuels like uranium carbides and plutonium carbides, which are known to be highly chemically active with oxygen and moisture demands adequate leak tightness during long term storage to avoid undesirable chemical reactions. Use of low melting alloys which acts as liquid/solid sealants in the storage containers in which fuel subassemblies are to be kept is being considered for this purpose. Lead-lithium (0.7 wt % lithium) eutectic alloy was chosen as one of the candidate alloys for the purpose on the basis of theoretical assessments. The candidate sealing alloy should have good compatibility with the structural materials of fuel subassemblies as well as the fuel and fission products. AISI type 316 stainless steel in solution annealed, ten and twenty percent cold worked condition is the clad and wrapper material used for the fabrication of fuel pins and subassemblies. Compatibility studies between eutectic Pb-Li alloy and AISI type 316 stainless steel material in the above conditions were undertaken at different temperatures and time durations. The studies indicate that the tensile properties of AISI type 316 stainless steel are not subject to any serious jeopardisation through contact with this molten Pb-Li eutectic alloy for periods extending even upto 7000 hours at 873 K. Thus use of Pb-Li eutectic alloy would be suitable for the storage of irradiated fuel. (author). 16 refs., 38 figs., 3 tabs.

985 (INFO–0379) **Hydrogen absorption-desorption at metal surfaces.** Ward, C.A.; Pataki, L. Atomic Energy Control Board, Ottawa, ON (Canada). Apr 1991. 59p. Project 2.174.1;Contract 87055-9-4053/01-SZ. Order Number DE93603259. Source: OSTI; NTIS (US Sales Only); INIS.

It is proposed that when zirconium oxide (ZrO_2) is exposed to hydrogen at 300 degrees C or higher, a reaction occurs to produce metallic zirconium and water, thereby increasing the electrical conductivity of the oxide film and its permeability to hydrogen. Experiments have been performed in which Zr and Zr-2.5% Nb were either hydrided or deuterided in a furnace between 300 C and 800 C and in an atmosphere that consisted primarily of either hydrogen or deuterium. After cooling a specimen to room temperature, it was placed in a thermogravimetric analyzer that was equipped with a mass spectrometer, TGA-MS. Each specimen was then heated to 1200 C at a controlled rate in a primarily helium atmosphere monitored with the mass spectrometer. Light water evolved from the hydrided specimens and heavy water from the deuterided ones and there was a weight loss of the specimens that accompanied the water evolution. The specimens having approximately the same amount of hydride but more oxide also evolved more H_2O, and that the H_2O did not come from reactions between impurity H_2 and O_2 in the TGA-MS. Heating a zirconium or zirconium alloy specimen that contains a hydride or deuteride phase within and an oxide layer on its surface causes the hydrogen to diffuse toward the surface and when it encounters the oxide a reaction follows that produces water. The conventional mechanism for the dissipation of the imperviousness of ZrO_2 to H_2 that results from the oxide being exposed to a reducing atmosphere will not explain the water production observed in these experiments. However, the existence of the proposed reaction can account for the elevated hydrogen concentration in an oxide film that has been observed to accompany the aqueous corrosion of zirconium and the effects on both the electrical conductivity and hydrogen permeability that (Abstract Truncated)

Joint Inst. for Nuclear Research, Dubna (Russian Federation). Lab. of Computing Techniques and Automation. 1991. 6p. Order Number DE93605264. Source: OSTI; NTIS (US Sales Only); INIS.

Using an example of inelastic collisions of ^{12}C ions with nuclei at 1.02 GeV the accuracy of cascade-evaporation model in prediction of properties of nuclear fragments and recoil nuclei, which make a main contribution in the radiation damage in semi-and superconductors, is analyzed. However some of its features concerning the production of moderately heavy fragments and corresponding to approximately 1% in inelastic interaction cross-section (and to small contribution of radiation damages respectively) contradiet qualitatively the model prediction and indicate the influence of some esentially different mechanism of reaction. 4 refs.; 7 figs.

Basing on an internuclear model and a computer programme for induced gamma-radiation activity calculation, the time-dependence of the gamma-background intensity, induced by cosmic radiation in structural materials Al, Ti, Fe, Cu, W, Pb and in one of the alloys at different periods. A table of gamma-emitters, making the main contribution at short and long durations of the flight is presented. 1 ref.; 8 figs.; 1 tab.

1008 (KAERI/RR–1076/91) **Study on the causes of failures in the Titanium tubes of condensers of nuclear power plant.** Kim, Uh Chul (Korea Atomic Energy Research Inst., Daeduk (Korea, Republic of)); Kim, Joung Soo; Chung, Han Sub; Hur, Do Hang; Hwang, Seong Sik. Korea Atomic Energy Research Inst., Daeduk (Korea, Republic of). Jan 1992. 109p. (In Korean). Order Number DE93605304. Source: OSTI; NTIS (US Sales Only); INIS.

This report is the result of galvanic corrosion tests among Al-brass, carbon steel and Ti, and hydrogen embrittlement of Ti tubes. The scopes of the project are hydrogen embrittlement, the effect of oxide layer on Ti model condenser tests, drop tests, and galvanic corrosion tests. The summary of the results is as follows: (1) The optimum cathodic protection potential of Ti tube was determined between -0.9V vs. SCE and -0.75V vs. SCE. (2) Mechanical properties and thermal diffusivity are not so affected by the oxide film formed on Ti. (3) As the cathodic potential and the flow rate decreased, absorbed hydrogen content increased. And cathodic protection current decreased very sharply along the tube axis away from the position where the tube is protected intensively. (4) As the area ratio of anode to cathode decreased, the corrosion rate of anode (carbon steel) increased, even at very low cathodic potential (-1.5V vs.SCE) applied to the carbon steel. (Author).

1009 (KAERI/RR–1079/91) **Study on the improvement of the properties of Zr alloys.** Kim, Young Suk (Korea Atomic Energy Research Inst., Daeduk (Korea, Republic of)); Han, Jung Ho; Jeong, Yong Hwan; Lee, Duk Hyun; Park, Gi Sung; Hong, Jun Hwa; Park, Ji Yun; No, Gae Ho. (1) The objective of this study is to develop the corrosion resistant zirconium base alloys. In order to achieve this goal, this year's activities have focused on the guidelines for the corrosion resistant zirconium alloy design, the manufacturing of the sheets of zirconium base alloys and finally the characterization of the NAZAs (New Alternate Zirconium alloys). The main results from this study can be summarized as follows: (2) Based on the evaluation of the role of alloying elements, i.e., Nb, Sn, Fe, Cr, and etc, as many as 23 different kinds of the NAZAs were preliminarily designed. (3) The 3 kinds of the NAZAs-Lot 15, 22 and 23 manufactured into a sheet though a series of manufacturing procedures. (4) The microstructures, hardness and the corrosion performances of 3 kinds of NAZAs were investigated. (Author).

Burkett, M.W. Los Alamos National Lab., NM (United States). [1992]. 20p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-921221–1: High velocity impact symposium, Austin, TX (United States), Dec 1992). Order Number DE92017452. Source: OSTI; NTIS; GPO Dep.

Models of craters formed by impacts at velocities of up to 27 km/sec have been computed using the Smooth Particle Hydrodynamics, MESA, EPIC and CALE codes. These modeling efforts will be compared to data obtained from the Hypervelocity Microparticle Impact project at Los Alamos using the van de Graaff accelerator. This work aids in understanding the fine features and scaling laws found in the experimental results.

1011 (LA-UR–92-3130) **Physics of YbBiPt.** Thompson, J.D. Los Alamos National Lab., NM (United States). 15 Sep 1992. 13p. Sponsored by USDOE, Washington, DC (United States); National Science Foundation, Washington, DC (United States). DOE Contract W-7405-ENG-36. Grant DMR-91-07698. (CONF-9209202–2: International conference on strongly correlated electron systems, Sendai (Japan), 7-11 Sep 1992). Order Number DE93000853. Source: OSTI; NTIS; INIS; GPO Dep.

YbBiPt has a low temperature linear specific heat coefficient of 8J/mole-Yb K^2 and a small specific-heat anomaly at 0.4K. We discuss new experiments on specific-heat of diluted YbBiPt, and magnetic field dependent effects and electrical resistivity in pure YbBiPt. We argue that in this material the Kondo and crystal-field energy scales are small and of comparable magnitude, placing YbBiPt in the same class as many Uranium heavy-electron compounds.

1012 (LBL–30937) **Quantum Monte Carlo methods and lithium cluster properties.** Owen, R.K. Lawrence Berkeley Lab., CA (United States). Dec 1990. 122p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00098. Order Number DE92041163. Source: OSTI; NTIS; GPO Dep.

Properties of small lithium clusters with sizes ranging from n = 1 to 5 atoms were investigated using quantum Monte Carlo (QMC) methods. Cluster geometries were found from complete active space self consistent field (CASSCF) calculations. A detailed development of the QMC method leading to the variational QMC (V-QMC) and diffusion QMC (D-QMC) methods is shown. The many-body aspect of electron correlation is introduced into the QMC importance sampling electron-electron correlation functions by using density dependent parameters, and are shown to increase the amount of correlation energy obtained in V-QMC calculations. A detailed analysis of D-QMC time-step bias is made and is found to be at least linear with respect to the time-step. The D-QMC calculations determined the lithium cluster ionization potentials to be 0.1982(14) [0.1981], 0.1895(9) [0.1874(4)], 0.1530(34) [0.1599(73)], 0.1664(37) [0.1724(110)], 0.1613(43) [0.1675(110)] Hartrees for lithium clusters n = 1 through 5, respectively; in good agreement with experimental results shown in the brackets. Also, the binding energies per atom was computed to be 0.0177(8) [0.0203(12)], 0.0188(10) [0.0220(21)], 0.0247(8) [0.0310(12)], 0.0253(8) [0.0351(8)] Hartrees for lithium clusters n = 2 through 5, respectively. The lithium cluster one-electron density is shown to have charge concentrations corresponding to nonnuclear attractors. The overall shape of the electronic charge density also bears a remarkable similarity with the anisotropic harmonic oscillator model shape for the given number of valence electrons.

1013 (LBL–32095) **The influence of deformation-induced martensite on the cryogenic behavior of 300-series stainless steels.** Morris, J.W. Jr.; Chan, J.W.; Mei, Z. Lawrence Berkeley Lab., CA (United States). Jun 1992. 14p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00098. (CONF-920614–4: International cryogenic engineering conference and the international cryogenic materials conference, Kiev (Ukraine), 8-12 Jun 1992). Order Number DE92041208. Source: OSTI; NTIS; INIS; GPO Dep.

The 300-series stainless steels that are commonly specified for the structures of high field superconducting magnets are metastable austenitic alloys that undergo martensitic transformations when deformed at low temperature. The martensitic tranformation is promoted by plastic deformation and by exposure to high magnetic fields. The transformation significantly influences the mechanical properties of the alloy. The mechanisms of this influence are reviewed, with emphasis on fatigue crack growth effects and magnetomechanical phenomena that have only recently been recognized.

1014 (LBL–32290) **Crystallography of Co/Pt multilayers and nanostructures.** Zhang, Bing (Lawrence Berkeley Lab., CA (United States)); Krishnan, K.M.; Farrow, R.F.C. Lawrence Berkeley Lab., CA (United States). Apr 1992. 24p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00098. (CONF-920450–1: 4. conference on frontiers of electron microscopy in materials science, Oakland, CA (United States), 21-24 Apr 1992). Order Number DE92041212. Source: OSTI; NTIS; GPO Dep.

Atomically engineered nanostructures and multilayers of Co/Pt exhibit strong perpendicular anisotropy. This unique property, that determines their potential as a magneto-optic recording media, is dependent on a variety of microstructural parameters that include the overall crystallography, thickness of the layers, orientation, defect formation, interface reactions etc. A series of Co/Pt multilayer samples with different thickness of the Co layer were studied by electron diffraction. It has been determined that the Co layers persists in the fcc structure up to a thickness of 50 Å. As the thickness is varied fmm 3Å to 50Å in the multilayers, the Co film gradually relaxed to its bulk lattice parameter. (111) twinning and lattice strain at the interfaces between Pt and Co layers are also observed. The symmetry forbidden reflections observed at 1/3 (224) positions in (111) zone diffraction patterns of the multilayer are due to (111) twinning and compositional modulations along the multilayer growth direction.

1015 (LBL–32390) **The effect of low Au concentrations on the properties of eutectic Sn/Pb.** Kramer, P.A. Lawrence Berkeley Lab., CA (United States). May 1992. 81p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00098. Order Number DE92041206. Source: OSTI; NTIS; GPO Dep.

This study was of the effects moderately low Au concentrations ($\leq$ 10 wt%) have on the mechanical properties and microstructure of an eutectic Sn/Pb alloy. Vibration (60–90 Hz swept sine wave for 30 hours) and thermal cycling (0–110C for 1450 cycles) reliability tests were performed on fine pitch leaded chip carriers using eutectic Sn/Pb solder on PCBs (printed circuit boards) with 0, 5, 10, 20, and 50μin nominal Au thicknesses. Testing was also performed on double shear creep specimens consisting of arrays of regular pitch joints. There was a dramatic increase in the number of joints containing voids with increasing Au concentration, an effect more pronounced in the creep joints than in the reliability joints. These voids tended to coalesce and grow during rework simulation of the reliability joints. $AuSn_4$ intermetallics present in toe of 4.8 wt% (50 μin) Au vibration joints rotated from initial vertical perpendicular to surface of PCB metallization, solidification positions to roughly horizontal (parallel to plating surface) orientations during rework simulation and during aging of the parts. The $AuSn_4$ intermetallics in the toe of the 4.8 wt% (50μin) Au reflowed joints also rotated after vibration testing. No joint failures were observed in either vibration tested or thermally cycled specimens. Cracks formed in some of the vibration tested specimen joints under the heel of the gull-wing lead at Pb-rich phases. Thermally cycled specimens showed eutectic microstructure and intermetallic coarsening without crack formation. Creep tests showed loss of the superplasticity in eutectic Sn/Pb alloys with even the lowest Au concentration tested of 0.2 wt% Au. Intermetallic rotation was not a factor in crack propagation, but void presence was. Cracks tended to form in joints containing voids before forming in void-free joints. Crack propagation followed Sn/Sn grain boundaries and Sn/Pb phase boundaries from Pb-rich phase to Pb-rich phase.

1016 (LBL–32400) **Nucleation and growth in electrodeposition of thin copper films on pyrolytic graphite.** Kinaci, F.S.; Muller, R.H. Lawrence Berkeley Lab., CA (United States). May 1992. 152p. Sponsored by USDOE, Washington, DC (United

States). DOE Contract AC03-76SF00098. Order Number DE92041216. Source: OSTI; NTIS; GPO Dep.

Electrodeposition of Cu on graphite electrodes was studied, with emphasis on nucleation. Various ex-situ and in-situ methods were investigated for determining the number density of nuclei. Two direct methods were studied (scanning electron microscopy and scanning tunneling microscopy); indirect determinations included Raman spectroscopy and analysis of potentiostatic current transients. Though some of the techniques correctly predicted the nucleation densities under special conditions, SEM was the most reliable tool. The large scatter in the data necessitated steps to minimize this effect. To electrodeposit Cu on graphite, a nucleation overpotential of 250 mV was measured with cyclic voltammetry; such a large overpotential does not occur on a Pt or on a Cu-covered graphite electrode. The deposition potential is the dominant parameter governing nucleation density. There is a sharp increase in the nucleation density with applied potential. Cu can be deposited on highly oriented pyrolytic graphite only between the nucleation overpotential and the hydrogen evolution potential. To increase the Cu nucleation density, while avoiding excessive H evolution, a double pulse potential technique was used; nucleation densities on the order of 10^{10} nuclei/cm^2 were achieved. The use of inhibitors (PVA, benzotriazole) was also investigated. Deposition on conducting polymer electrodes was also studied; initial results with polyaniline show promise. 57 figs, 6 tabs, refs. (DLC)

1017 (LBL–32483) **A Boltzmann-equation approach to the magnetoresistance of ferromagnetic-normal metallic multilayers.** Falicov, L.M.; Hood, R.Q. Lawrence Berkeley Lab., CA (United States). Jun 1992. 14p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00098. (CONF-9209227–1: Symposium on magnetic ultrathin films, multilayers, and surfaces, Lyon (France), 7-10 Sep 1992). Order Number DE92041213. Source: OSTI; NTIS; GPO Dep.

The Boltzmann equation is solved for a system consisting of a ferromagnetic - normal - ferromagnetic metallic trilayer. The in-plane conductance of the film is calculated for two configurations: the ferromagnetic layers aligned (i) parallel and (ii) antiparallel to each other. The results explain the giant negative magnetoresistance encountered in these systems when an initial antiparallel arrangement is changed into a parallel configuration by application of an external magnetic field. A large negative magnetoresistance requires, in general, considerable asymmetry in the interface scattering for the two spin orientations.

1018 (LBL–32711) **Low-temperature specific heat of YMn_2 in the paramagnetic and antiferromagnetic phases.** Fisher, R.A. (Lawrence Berkeley Lab., CA (United States)); Emerson, J.P.; Phillips, N.E.; Ballou, R.; Lelievre-Berna, E. Lawrence Berkeley Lab., CA (United States). Jul 1992. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00098. (CONF-920762–5: International conference on the physics of transition metals, Darmstadt (Germany), 20-24 Jul 1992). Order Number DE93000570. Source: OSTI; NTIS; GPO Dep.

The low-temperature specific heat of YMn_2 has been measured at applied pressures of 0 to 7.7 kbar. A paramagnetic state is stabilized for moderate values of the applied pressure (of the order of 1.6 kbar). A large linear term in the specific heat, which decreases regularly with increasing pressure, is observed in this phase. It is ascribed to giant spin fluctuations associated with a magnetic-non magnetic instability and a strong geometrical spin frustration.

1019 (LBL–32715) **Quasiparticle properties of Ge(111)-2 × 1 surface.** Zhu, X.; Louie, S.G. Lawrence Berkeley Lab., CA (United States). Aug 1992. 4p. Sponsored by USDOE, Washington, DC (United States); National Science Foundation, Washington, DC (United States). DOE Contract AC03-76SF00098. Grant DMR-9120269. (CONF-920825–1: 21. international conference on the physics of semiconductors, Beijing (China), 10-14 Aug 1992). Order Number DE93000574. Source: OSTI; NTIS; INIS; GPO Dep.

We have studied from first principles the quasiparticle properties of the 2 × 1 reconstructed (111) surface of Ge. Quasiparticle energies are calculated using the GW expansion of the electron self energy operator. The calculations explain a spectrum of experimental results obtained from photoemission, inverse photoemission, optical absorption, scanning tunneling microscopy, etc., for this surface. We also present a quasiparticle theory for the photoelectric threshold and examine the effects of many body corrections for this quantity.

1020 (SAND–92-1289C) **Modeling of the vacuum plasma spray process.** Varacalle, D.J. Jr. (Idaho National Engineering Lab., Idaho Falls, ID (United States)); Neiser, R.A.; Smith, M.F. Sandia National Labs., Albuquerque, NM (United States). [1992]. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789 ;AC07-76ID01570. (CONF-9206135–8: 1992 international thermal spray conference, Orlando, FL (United States), 1-5 Jun 1992). Order Number DE93000718. Source: OSTI; NTIS; GPO Dep.

Experimental and analytical studies have been conducted to investigate gas, particle, and coating dynamics in the vacuum plasma spray (VPS) process for a tungsten powder. VPS coatings were examined metallographically and the results compared with the model's predictions. The plasma was numerically modeled from the cathode tip to the spray distance in the free plume for the experimental conditions of this study. This information was then used as boundary conditions to solve the particle dynamics. The predicted temperature and velocity of the powder particles at standoff were then used as initial conditions for a coating dynamics code. The code predicts the coating morphology for the specific process parameters. The predicted characteristics exhibit good correlation with the observed coating properties.

1021 (SAND–92-1769C) **Generation of aerosolized particulate contamination by the wear of stainless steels.** McIntyre, D.C.; Dugger, M.T.; Rader, D.J. Sandia National Labs., Albuquerque, NM (United States). [1992]. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. (CONF-9210125–2: Microcontamination '92, Santa Barbara, CA (United States), 23-30 Oct 1992). Order Number DE93000742. Source: OSTI; NTIS; GPO Dep.

Pin-on-disc testing was used to generate wear particles from 304 and 440C stainless steels in presence of low-velocity interfacial air flows from a laminar flow bench. The aerosolized wear generated particles were studied using optical particle counters. In some cases, the particles were also collected using an electrostatic precipitator. The tests showed that 440C pins in unlubricated sliding contact with 440C discs and 304 discs generated mostly submicron particles, but that many of these submicron particles were detached from the wear surfaces as parts of agglomerated macro-particles.

1022 (SKB-TR–91-60) **Spent fuel corrosion and dissolution.** Forsyth, R.S. (Studsvik AB, Nykoeping (Sweden)); Werme, L.O. Swedish Nuclear Fuel and Waste Management Co., Stockholm (Sweden). Dec 1991. 60p. Order Number DE93603349. Source: OSTI; NTIS; INIS.

This paper presents the current status of the Swedish programme for the study of the corrosion of spent fuel in bicarbonate groundwaters. Results from the on-going experimental programme are presented and compared with the data base accumulated over the past ten years. Release of uranium and the other actinides was solubility-controlled under the semi-static type of experiments performed. The limiting solubility for uranium under oxic conditions was consistent with the hypothesis that the redox potential of the system is assumed to correspond to the U_3O_7/U_3O_8 transition. The measured release fractions for ^{137}Cs, ^{90}Sr and ^{99}Tc are discussed and used to exemplify the probable dissolution and corrosion processes involved. A substantial part of the Swedish programme is directed to the characterization of spent fuel before and after corrosion tests. Recent results are presented on the identification of possible corrosion sites. (26 refs.) (au).

1023 (SKB-TR–91-62) **The kinetics of pitting corrosion of carbon steel applied to evaluating containers for nuclear waste disposal.** Marsh, G.P. (Strategic Studies Dept., AEA Technology, Harwell Lab. (United Kingdom)); Taylor, K.J.; Harker, A.H. Swedish Nuclear Fuel and Waste Management Co., Stockholm (Sweden). Jul 1991. 73p. Order Number DE93603350. Source: OSTI; NTIS; INIS.

This is the final summary report on a project, funded by SKB, investigating the pitting corrosion of carbon steel containers for high level nuclear waste or spent reactor fuel under granite disposal

conditions. The study has covered a statistically based experimental programme to establish the pit growth kinetics, and a modelling study to determine the maximum pitting period subsequent to repository closure. It is shown that the rate of pit propagation is slower than that suggested by earlier work and that the maximum pitting period is only a small fraction of the target container life of 1000 years. An illustrative example of the methodology for estimating the corrosion allowance needed to prevent pit penetration is given. This could be applied to specific repository conditions as defined by SKB. Finally some limited recommendations are made for further studies to test and validate the methodology. (au).

1024 (SKB-TR--91-63) **An electrochemistry-based model for the dissolution of UO_2.** Shoesmith, D.W. (AECL Research, Whiteshell Labs., Pinawa, MB (Canada)); Sunder, S. Swedish Nuclear Fuel and Waste Management Co., Stockholm (Sweden). Dec 1991. 108p. Order Number DE93603351. Source: OSTI; NTIS; INIS.

A model to predict dissolution of UO_2 fuel under both oxidizing and nonoxidizing conditions is compared with other available models for fuel dissolution. Dissolution rates under oxidizing conditions are predicted by extrapolating steady-state electrochemical currents for anodic dissolution of UO_2 to the corrosion potentials measured in solutions containing various oxidants, including dissolved oxygen, hydrogen peroxide, and products of gamma or alpha radiolysis of water. Where possible, the predictions are compared with dissolution rates measured chemically and available in the literature. With a few exceptions, agreement between predictions and published rates is good. For nonoxidizing conditions, dissolution rate of UO_2 is not well known. Attempts to measure this rate are fraught with difficulties, and the published values are difficult to rationalize within the framework of our model. Consequently, we briefly reviewed the literature on dissolution of similar p-type semiconducting oxides and chose to estimate the chemical dissolution rate of UO_2 by analogy to the well-studied oxide NiO. In this manner we have managed to establish a threshold rate below which the rate of oxidative dissolution becomes negligible in comparison with the rate of chemical dissolution. This threshold agrees quite well with that established electrochemically. Using these extrapolated rates we predict that the rate for oxidative dissolution of CANDU (CANada Deuterium Uranium) fuel due to gamma radiolysis will fall below this threshold after $\approx$ 200 a, a time period that is short in comparison with the anticipated lifetimes of titanium waste containers, which are expected to last for a period greater than $\approx$ 1200 a. For dissolution due to alpha radiolysis, oxidative rates are uncertain, but could be above this threshold for a period of 500 to 10000 a for CANDU fuel, and 500 to 30000 a for pressurized water reactor (PWR) fuel.

1025 (SKB-TR--92-04) **Low temperature creep of copper intended for nuclear waste containers.** Henderson, P.J. (Swedish Inst. for Metals Research, Stockholm (Sweden)); Oesterberg, J.O.; Ivarsson, B. Swedish Nuclear Fuel and Waste Management Co., Stockholm (Sweden). Mar 1992. 36p. Order Number DE93603242. Source: OSTI; NTIS; INIS.

Creep tests have been carried out on oxygen-free high purity copper (Cu-OF) oxygen-free phosphorus copper (Cu-OFP) and oxygen-free copper containing 0.15 wt% Ag (Cu-OFS) at temperatures between 180 and 450 degrees C. Some Cu-OF batches exhibited poor ductility and ruptured at creep strains of less than 1% while another batch produced acceptable ductility values of about 10% elongation at fracture. These differences in ductility were attributed to a combination of sulphur content and grain size. Specimens of Cu-OFP and Cu-OFS ruptured at creep strains of 30% or greater. It was speculated that small additions of P or Ag could increase the solid solution of S in copper and therefore reduce the risk of grain boundary segregation and embrittlement or that an element like P co-segregates with S and competes for grain boundary sites. (au).

1026 (UCRL-JC--109382) **Improvement in the synthesis of Ni/Ti neutron mirrors.** Jankowski, A.F. Lawrence Livermore National Lab., CA (United States). Jun 1992. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-920792--37: Society of Photo-Optical Instrumentation Engineers (SPIE) international symposium on optical applied science and engineering, San Diego, CA (United States), 19-24 Jul 1992). Order Number DE93001322. Source: OSTI; NTIS; GPO Dep.

Improvement in the as-deposited structure of Ni/Ti multilayers is achieved through optimization of the sputter deposition process. In the as-deposited condition, these Ni/Ti multilayers are well suited for very high reflectivity (>95%) neutron supermirror application. Smooth layering is produced with compositionally abrupt interfaces yielding an effective roughness less than 1nm. The deposition parameters are controlled to produce a near thermalized condition for the sputtered neutrals. The Ni/Ti multilayer system is not structurally stable, however, when subject to moderate heating (>300°C) or irradiation. The in-use degradation of interface structure from neutron irradiation may be a limitation for the Ni/Ti system.

1027 (UCRL-JC--110724) **First-principles approach to alloy phase stability.** Turchi, P.E.A.; Reinhard, L.T.; Sluiter, M. Lawrence Livermore National Lab., CA (United States). 22 May 1992. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-920762--7: International conference on the physics of transition metals, Darmstadt (Germany), 20-24 Jul 1992). Order Number DE93001323. Source: OSTI; NTIS; GPO Dep.

Order-disorder phenomena and structural transformations in substitutional alloys are studied with a proper combination of quantum mechanics and statistical thermodynamics. The methodology is briefly presented and its predictive capabilities are illustrated for various alloys, including the bcc-based Ti-V, Ti-Fe and Cr-Fe systems, in terms of electronic structure, ground-state and short-range order diffuse scattering properties, and finally phase diagram results.

Ag-clad wires have been fabricated from $Bi_2Sr_2CaCu_2O_x$, $Bi_{1.8}Pb_{0.4}Sr_2Ca_2Cu_3O_x$, and $TlBa_2Ca_2Cu_3O_x$ superconductors by powder- in-tube techniques. Critical current densities of 1×10^5 A/cm^2 at 4.2 K and 3×10^4 A/cm^2 at 77 K have been obtained. Additions of particulate Ag have been used to improve mechanical properties and promote partial melting during heat treatment. The processing sequences for the compounds had many common features, but also significant differences. The effects of processing on microstructure and properties will be discussed.

1029 (ANL/CP--77169) **Local critical current measurements on $(Bi,Pb)_2Sr_2Ca_2Cu_3O_x$ tape with an electromagnetic probe.** Telschow, K.L. (EG and G Idaho, Inc., Idaho Falls, ID (United States)); O'Brien, T.K.; Lanagan, M.T.; Kaufman, D.Y. Argonne National Lab., IL (United States); EG and G Idaho, Inc., Idaho Falls, ID (United States). 24 Aug 1992. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38 ;AC07-76ID01570. (EGG-M--92184;CONF-920802--11: Applied superconductivity conference, Chicago, IL (United States), 23-28 Aug 1992). Order Number DE92041133. Source: OSTI; NTIS; INIS; GPO Dep.

The ability to measure critical currents in high $T_c$superconducting tapes on a local scale is valuable for optimizing the fabrication process. This paper describes the use of induced currents from a small noncontacting electromagnetic probe to determine the critical current density in a $(Bi,Pb)_2Sr_2Ca_2Cu_3O_x$/Ag tape on a local scale. The technique forces full field penetration into the tape locally and infers the critical current density from the Bean critical state model, accounting for the Ag overlayers. Critical current images of the till can be obtained by scanning the probe over the tape surface with

spatial resolution on the order of 1.0 mm. Results for tapes with different microstructures we discussed.

1030 (ANL/CP–77183) **Processing high-$T_c$superconductors with GeV heavy ions.** Marwick, A.D. (International Business Machines Corp., Yorktown Heights, NY (United States). Thomas J. Watson Research Center); Civale, L.; Krusin-Elbaum, L; Worthington, T.K.; Holtzberg, F.; Wheeler, R.; Kirk, M.A.; Thompson, J.R.; Sun, Y.R.; Kerchner, H.RArgonne National Lab., IL (United States). [1992]. 29p. Sponsored by USDOE, Washington, DC (United States); National Science Foundation, Washington, DC (United States). DOE Contract W-31109-ENG-38. Contract STC-8809854. (CONF-9209200–3: 8. international conference on ion beam modification of materials, Heidelberg (Germany), 7-11 Sep 1992). Order Number DE92040755. Source: OSTI; NTIS; INIS; GPO Dep.

Irradiation of high-$T_c$superconducting crystals with low doses (10^{10}–10^{11} ions/cm^2) of GeV heavy ions (0.58 GeV Sn-116; 1.0-GeV Au-197) produces a unique microstructure consisting of discrete amorphous columns which are only a few nm in diameter but tens of microns long. It has been found recently that this columnar microstructure causes larger increases in magnetization and critical current at high temperature and high magnetic field than other types of defects in these materials. This can be understood as a consequence of the effective pinning of magnetic vortex lines provided by the columnar defects. Measurements confirm that the pinning is strongest when the magnetic field is aligned with the ion tracks. Differences in the pinning in different materials can be related to differences in their anisotropy, which affects the structure of the vortices and their pinning at columnar defects.

1031 (ANL/CP–77430) **Current transport across grain boundaries in $TlBa_2Ca_2Cu_3O_x$ thick polycrystalline films and $YBa_2Cu_3O_7$ step edges.** Hettinger, J.D. (Argonne National Lab., IL (United States)); Kim, D.H.; Miller, D.J.; Hu, J.G.; Gray, K.E.; Sharping, J.E.; Daly, K.; Pettiett-Hall, C.; Tkaczyk, J.E.; Deluca, J. Argonne National Lab., IL (United States). Aug 1992. 5p. Sponsored by USDOE, Washington, DC (United States); National Science Foundation, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-920802–21: Applied superconductivity conference, Chicago, IL (United States), 23-28 Aug 1992). Order Number DE93000610. Source: OSTI; NTIS; GPO Dep.

We have performed transport measurements in magnetic fields (H//c) up to 10T on a series of $YBa_2Cu_3O_7$ grain boundaries induced by epitaxial growth on a substrate containing a series of step edges. For this material we find an activation energy which goes as $U(T)\sim(1-t)$. Electric field versus current density curves taken at a constant temperature while varying the magnetic field allows a determination of the magnetic field dependence of the activation energy using the Ambagaokar-Halperin Model. These values agree with results extracted from the resistive transitions. Similar characterizations of a sample of $TlBa_2Ca_2Cu_3O_x$ are also presented. The temperature dependence of the activation energy for this system may be summarized as $U(T)\sim(1-t)^2$, suggesting that the grain boundaries behave as SNS juctions.

1032 (ANL/CP–77431) **Effect of substrate-twin-induced microstructure on transport properties of epitaxial $Tl_2Ba_2CaCu_2O_x$ films in a magnetic field.** Kim, D.H. (Argonne National Lab., IL (United States)); Miller, D.J.; Hettinger, J.D.; Gray, K.E.; Landis, P.G.; Sharping, J.E.; Eddy, M. Argonne National Lab., IL (United States). Aug 1992. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-920802–18: Applied superconductivity conference, Chicago, IL (United States), 23-28 Aug 1992). Order Number DE93000605. Source: OSTI; NTIS; GPO Dep.

The role of substrate-induced microstructure on transport properties in c-axis oriented epitaxial $Tl_2Ba_2CaCu_2O_x$ films grown on $LaAlO_3$ and $SrTiO_3$ has been studied. For a magnetic field parallel to the Cu-0 planes, resistivity and the critical current density, J_c, have been measured as a function of angle θ between the applied field and the direction of transport current. Resistivity dips and enhancement of the critical current density, J_c, were observed for magnetic fields applied parallel to the substrate twins in $LaAlO_3$ in high fields ($\geq$ 2 T). Meanwhile for films on $SrTiO_3$, resistivity and J_c were Lorentz-force independent.

1033 (ANL/CP–77432) **Enhanced superconducting properties in $Bi_2Sr_2Ca_1Cu_2O_y$ by thermal and mechanical processing.** Miller, D.J.; Holesinger, T.G.; Hettinger, J.D.; Goretta, K.C.; Gray, K.E. Argonne National Lab., IL (United States). Aug 1992. 5p. Sponsored by USDOE, Washington, DC (United States); National Science Foundation, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-920802–22: Applied superconductivity conference, Chicago, IL (United States), 23-28 Aug 1992). Order Number DE93000609. Source: OSTI; NTIS; GPO Dep.

The practical application of high temperature superconductors has been limited by low transport currents in bulk samples. The effect of processing on transition temperature, grain boundary coupling, and flux pinning has been examined for $Bi_2Sr_2Ca^1Cu_{,2}O_y$. Enhancement of $T_c$based on composition can be achieved by control of crystallization and subsequent annealing processes while thermo-mechanical processing may be used to modify weak link and flux pinning behavior. The microstructural basis for these changes are related to the composition of the superconducting phase and the presence of defects associated with deformation processing. The implications of these results on conductor development are related to the selection of alloy composition for optimum transition temperature and controlled thermo-mechanical processing which yields a uniform defect structure.

1034 (ANL/CP–77433) **Scaling laws for the critical current density of NbN films in high magnetic fields.** Hampshire, D.P. (Durham Univ. (United Kingdom). Dept. of Physics); Gray, K.E.; Kampwirth, R.T. Argonne National Lab., IL (United States). Aug 1992. 8p. Sponsored by USDOE, Washington, DC (United States); University Funding Council (United States); Science and Engineering Council (United States). DOE Contract W-31109-ENG-38. (CONF-920802–20: Applied superconductivity conference, Chicago, IL (United States), 23-28 Aug 1992). Order Number DE93000604. Source: OSTI; NTIS; GPO Dep.

We have measured the critical current density (Jc) of two NbN films (500 Å and 1550 Å thick) as a function of temperature in magnetic fields up to 25 Tesla using transport measurements. In both films, the functional form of the volume pinning force F_p obeys the Fietz - Webb scaling law throughout the entire magnetic field and temperature range such that: $F_p=J_c \times B= \alpha B_{c2}{}^m(T)b^{\frac{1}{2}}(1-b)^2 = \alpha^*(1-T/T_c)^m b^{\frac{1}{2}}(1-b)^2$ where α and α^* are constants dependent on the film, $B_{c2}(T)$ is the upper critical field, $b = B/B_{c2}(T)$ is the reduced magnetic field, $T_c$is the critical temperature and we find $m = 2.7 \pm 0.1$. Over a limited range of magnetic fields close to $B_{c2}(T)$, we can approximate this functional form by: $F_p = BB_{c2}{}^M(T)b(1-b)^2=B^*(1-T/T_c)^M b(1-b)^2$ where B and B* are constants and we find $M = 2.6\pm0.2$. Values of J_c derived from D.C. magnetisation data obtained using Bean's model show qualitative agreement with the transport measurements throughout the superconducting phase. Despite the marked granularity in the microstructure of these films, we interpret our results as evidence that a flux pinning mechanism determines the transport current density in NbN films in high magnetic fields.

1035 (BNL–47891) **Large magnetic field induced fluctuation effect in superconducting $Bi_2Sr_2Ca_2Cu_3O_{10}$ tape.** Li, Q. (Brookhaven National Lab., Upton, NY (United States)); Suenaga, M.; Hikata, T.; Sato, K. Brookhaven National Lab., Upton, NY (United States). [1992]. 3p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016. (CONF-920802–12: Applied superconductivity conference, Chicago, IL (United States), 23-28 Aug 1992). Order Number DE92041314. Source: OSTI; NTIS; GPO Dep.

We present our study on the magnetic field induced fluctuation effect in a highly textured $Bi_2Sr_2Ca_2Cu_3O_{10}$ tape, based on the magnetization measurement. Extremely large induced excess diamagnetism in high fields was observed at temperatures down to 75 K. In weak fields, fluctuation significantly reduces the diamagnetism of this system just below T_c. The role of this large extended fluctuation effect played in the application of Bi-based superconductor family is discussed.

1036 (CEAC-R–1-91) **Preparation of high temperature superconductor ceramics using cuban reactives. Optimization of**

the synthesis method. Leyva Fabelo, A. (Centro de Estudios Aplicados al Desarrollo Nuclear (CEADEN), La Habana (Cuba)); Cruz, C.; Aragon, B.; Suarez, J.C.; Mora, M. Comision de Energia Atomica, La Habana (Cuba). 1991 13p. (In Spanish). Order Number DE93603355. Source: OSTI; NTIS (US Sales Only); INIS.

Results of the crystallographic characterization of a group of Cuban Products, which are evaluated to be employed in HTSC fabrication are presented in this paper. The first results on the synthesis of HTSC ($RBa_2Cu_3O_{7\delta}$, R= Y, La, Nd) using Cuban reactives, are presented. The so called 'solid state reaction method of synthesis' was optimized, obtaining a critical temperature of more than 93 k.

1037 (CONF-9209200–2) **Ion implantation effects in silicon carbide.** McHargue, C.J. (Tennessee Univ., Knoxville, TN (United States)); Williams, J.M. Oak Ridge National Lab., TN (United States). Aug 1992. 17p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From 8. international conference on ion beam modification of materials; Heidelberg (Germany); 7-11 Sep 1992. Order Number DE92041306. Source: OSTI; NTIS; GPO Dep.

Results from a program, on ion implantation effects in α and β silicon carbide will be summarized. Silicon carbide is easily amorphized by ion implantation at room temperature. Amorphization as determined by Rutherford backscattering spectrometry (RBS) occurs for damage energies of about 20 eV/atom, corresponding to 0.2 to 0.3 displacements per atom (dpa), at room temperature. Implantation at higher temperatures (≈500°C or above) does not produce an amorphous region for damage levels as high as 17 dpa. Recovery of damage at the subamorphous damage level is fairly complete by 1000°C. Epitaxial regrowth after amorphization occurs over a very narrow temperature range at ≈1500°C in an almost "explosive" fashion. Damage and amorphization are accompanied by swelling of up to 15%. The hardness and elastic modulus values of amorphous SiC are 40% and 70%, respectively, of the unimplanted single crystalline values, but before amorphization, the hardness first increases during the early damage phase and then decreases upon amorphization. The oxidation and chemical etching rates of the amorphous state are higher than for crystalline material. Amorphization kinetics, annealing kinetics and property changes are broadly compatible with the idea of a critical accumulation model for amorphization.

1038 (DOE/ER/45372–5) **Energetics, bonding mechanism and electronic structure of metal/ceramic interfaces: Annual progress report, April 1, 1992–March 31, 1993.** Freeman, A.J. Northwestern Univ., Evanston, IL (United States). Dept. of Physics and Astronomy. [1993]. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-88ER45372. Order Number DE93003121. Source: OSTI; NTIS; GPO Dep.

Progress are reported on: electronic structure of PdO, PtO, and AgO (band structure calculations); ab initio calculations of electronic structure of TiO_2(110) surface; and electronic structure of VO_2 and TiO_2 thin films and multilayers. (DLC)

1039 (DOE/ER/45400–T4) **Mechanisms of mechanical fatigue in ceramics: Annual technical progress report No. 2, August 15, 1990–August 14, 1991.** Cox, B. Rockwell International Corp., Thousand Oaks, CA (United States). Science Center. Oct 1992. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG03-89ER45400. (SC–71014.ATR). Order Number DE93001726. Source: OSTI; NTIS; GPO Dep.

This report covers work done in the second twelve month period of our initial two-year contract on "Mechanisms of Mechanical Fatigue in Ceramics." A large portion of our work in that period consisted of developing the theory of bridged cracks, with especial emphasis on interpreting fatigue and fracture experiments in terms of micromechanical mechanisms. In the experimental area, we shifted our focus away from room temperature tests of metal reinforced ceramics such WC/Co to high temperature testing of fibrous composites. We also participated in a major review of experimental progress in the fatigue of ceramic materials through an international conference, edited proceedings, and a published review.

1040 (DOE/ID/12949–T1) **Evaluation of cerium oxide coated Cu cermets as inert anodes for aluminum electrowinning: Final report, August 1990–March 1992.** ELTECH Research Corp., Fairport Harbor, OH (United States). Aug 1992. 149p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FC07-90ID12949. Order Number DE92019333. Source: OSTI; NTIS; GPO Dep.

Cu/$NiFe_2O_4$ cermets were evaluated, with and without an in-situ deposited CEROX (TM; cerium oxide) coating, in 100 h laboratory A1 electrowinning tests. Bath ratio and current density were varied between tests and corrosion was determined by contamination of the aluminum and cryolite by cermet components (Cu, Fe, and Ni). Higher bath ratios of 1.5 to 1.6 led to less corrosion and thicker CEROX coatings. Lower current densities led to slightly less corrosion but much less oxidation of the Cu cermet substrate. At identical test conditions, the corrosion of the CEROX coated cermets was 1/7 that of an uncoated cermet. Corrosion was increased in CEROX coated cermets tested under unsaturated alumina conditions. The electrical conductivity of the CEROX coating was measured to be ~0.2 $ohm^{-1}cm^{-1}$, resulting in a slight voltage penalty, depending on the thickness of the coating.

1041 (DOE/PC/91309–T5) **High temperature alkali corrosion of ceramics in coal gas: Quarterly progress report No. 4, June 1, 1992–August 31, 1992.** Pickrell, G.R.; Sun, T.; Brown, J.J. Virginia Polytechnic Inst. and State Univ., Blacksburg, VA (United States). Center for Advanced Ceramic Materials. 29 Aug 1992. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG22-91PC91309. Order Number DE93000902. Source: OSTI; NTIS; GPO Dep.

High temperature alkali corrosion has been known to cause premature failure of ceramic components used in advanced high temperature coal combustion systems such as coal gasification and clean-up, coal fired gas turbines, and high efficiency heat engines. The objective of this research is to systematically evaluate the alkali corrosion resistance of the most commonly used structural ceramics including silicon carbide, silicon nitride, cordierite, mullite, alumina, aluminum titanate, zirconia, and fireclay glass. The study consists of identification of the alkali reaction products (phase equilibria) and the kinetics of the alkali reactions as a function of temperature and time.

1042 (FRCEA-TH–367) **Modifications study of the electronic structure of silicon oxides (α-SiO_2), aluminium oxides (α-Al_2O_3) and yttrium oxides (Y_2O_3), induced by structural defects (non-stoichiometry, mechanical strains, high energy ions irradiation).** Jollet, F. CEA Centre d'Etudes Nucleaires de Saclay, 91 - Gif-sur-Yvette (France). Direction du Cycle du Combustible; Paris-6 Univ., 75 (France). Oct 1989. 176p. (In French). Order Number DE93720892. Source: OSTI; NTIS (US Sales Only); INIS.

Structure defects effects on electronic structure were studied experimentally (X absorption spectroscopy and photoelectron spectroscopy) and theoretically (state density calculus based on high binding strengths). This thesis is divided into three parts: oxygen stoichiometry effect on yttrium oxide (Y_2O_3) electronic structure, mechanical strain effect on quartz-α (SiO_2) electronic structure, high energy ions irradiation effects on quartz-α. (A.B.). refs., figs., tabs.

1043 (FRNC-TH–3720) **Study by X-ray diffraction of structure modifications induced by pressure in different actinide compounds: AnO_2 dioxides (An=Th, Pu, Am), $AnCl_4$ tetrachlorides (An=Th, U), UB_x borides (x=2,4,12) and the carbide UC_2.** Dancausse, J.P. Paris-11 Univ., 91 - Orsay (France). 16 Oct 1991. 257p. (In French). Order Number DE93721058. Source: OSTI; NTIS (US Sales Only); INIS.

Structural transitions, induced by pressure, of actinide compounds are studied by X-ray diffraction, the determination of incompressibility is also studied at atmospheric pressure. The crystal structure of ThO_2, PuO_2 and AmO_2 evolves, near 40 MPa from a fcc lattice to an orthorhombic lattice. Incompressibility values associated to UO_2 and NpO_2 incompressibility evidence an important discontinuity between UO_2 and NpO_2 and other dioxides due to their different electronic structure. Tetragonal $ThCl_4$ and UCl_4 undergo a structure transition respectively at 2 and 5 GPa. UCl_4 becomes monoclinic and its color changes. At higher pressure

these compounds become progressively amorphous. The crystal structure of uranium borides is not changed up to 50 GPa. UC_2 presents a phase transition at 17.6 GPa from a tetragonal to a hexagonal lattice.

1044 (INIS-BR–2933, pp. 216) **Analysis of PZT formation prepared by citrate organic solution.** Paiva-Santos, C.O. (UNESP, Presidente Prudente, SP (Brazil). This study demonstrated that glass-ceramic processing (crystallization, sintering under uniaxial stress) in a uniaxial strain field can

rapidly produce well-textured Bi-2212 ($Bi_2Sr_2CaCu_2O_8$). This process is sensitive to oxygen partial pressure and oxygen content. The material textured by this process remains weak linked even at low temperature and low applied magnetic fields. Parameters that need to be optimized include composition, oxygen content, and processing. (DLC)

1065 (IS-T–1613) **Phase equilibria, superconductivity, and flux creep in $Nd_{1+x}Ba_{2-x}Cu_3O_{7+\delta}$ superconductors.** Yoo, Sang-Im. Ames Lab., IA (United States). 9 Sep 1992. 119p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-82. Order Number DE93001223. Source: OSTI; NTIS; GPO Dep.

$NdBa_2CU_3O_7$ (Ndl23) is one of $REBa_2CU_3O_7$ (RE123) superconductors (RE = Y and rare earths), having $T_c$of about 90 K. The phase diagram in the Nd-Ba-Cu-O system, superconductivity in Ndl23ss, and the role of Nd substitution for Ba sites as the magnetic flux pinning sites were investigated. The discrepancies in published phase diagrams were clarified. Significant results contain the solubility limits of $0.04 \leq x \leq 0.6$ in Ndl23ss, the existence of Nd_2BaCuO_{10} having a solid solution, and a discovery of a new phase $NdBa_6CU_3O_y$. Superconductivity in $Nd_{1+x}Ba_{2-x}CU_3O_{7+\delta}$ was studied for well- characterized samples with sharp transitions. With the substitution of Nd^{+3} for Ba^{+2}, there is an increase in the O(5) sites surrounding this substitution. While for $x > O.I$ there is a significant depression ofT_c, for $x < O.I$ there is no substantial decrease in $T_c$within experimental error. $T_c$vs x is characterized by two plateaus analogous to $T_c$vs d in $YBa_2CU_3O_{7-d}$. Analysis of O content of Ndl23ss suggests the analogy with Y123 is valid. Transition width and Meissner fraction for all Ndl23ss samples are strongly dependent on the sintering temperature. Hysteresis show good intragranular critical currents (J_c) at high fields but still low intergranular. Since the magnetic fields penetrate a Type II superconductor at high field, flux lines must be pinned to increase the J_c. While $T_c$is not affected over the range $0 < x < 0.1$, the oxygens surrounding the substituted Ba sites are expected to locally suppress the superconducting order parameter. Such a local suppression of the order parameter may act as a flux pinning site. Hysteresis exhibits a small increase in the magnetic J_c, but flux creep measurements show no apparent effects of this substitution on flux pinning energy.

1066 (JINR-E–17-91-159) **A dynamical model of structural phase transition in La_2CuO_4.** Plakida, N.M.; Krasavin, S.E. Joint Inst. for Nuclear Research, Dubna (Russian Federation). Lab. of Theoretical Physics. 1991. 10p. Order Number DE93605325. Source: OSTI; NTIS (US Sales Only); INIS.

A microscopical models of anharmonic lattice dynamics for $La_{2-x}M_xCuO_4$ crystals is proposed to describe the soft tilting mode and its interaction with strains. The free energy for the model is calculated and the structural phase transition $D_{4h}^{17} \rightarrow D_{2h}^{18} \rightarrow D_{4h}^{16}$ are considered. It is proposed a strong x-dependence of anharmonic constants especially for apical oxygen displacements. 18 refs.

Doctoral thesis submitted by D. Baer.

The aim of this work is to verify the influences of the different single procedure steps on the microstructure of sintered alumina and to get a correlation between the product characteristics and the characteristic data. The powder production was carried out by using the sol-gel-process followed by freeze-drying of the gel. From the boehmit-powder porous and inhomogen microstructure of the sintered pellets was obtained. The unfavourable morphology of the hydroxide-powder could be eliminated by pre-calcination followed by powder-milling. Because of the wet-milling after the pre-calcination the powder was doped with α-Al_2O_3, caused by the abrasion of the milling-mug and -balls, and therefore the calcinating temperature could be reduced to 1050deg C. Two charges of the colloidal-chemical produced powder and four commercial powders with different characteristics with regard to the purity or doping and particle-size and -distribution were compared with themselves. These powders were cold-isostatically pressed and sintered under different conditions. It could be shown that the influence of the impurities on the microstructure is higher than the influence of the grain size distribution. Impurities lead to a discontinous grain size distribution and intracristalline pores in sintered bodies, even using powders with a small grain size distribution. Measurements on the slip casted samples yielded for all powders different relationships between the viscosity and the pH. There was no visible influence of different pH-values on the microstructure (pH always measured at the minimum of the viscosity). Here the influence of the purity and the grain size distribution on the microstructure was less pronounced compared with the isostatically pressed ceramics. (orig.).

1068 (KAERI/RR–1096/91) **The development of SiC whisker fabrication technology for nuclear applications.** Kang, Thae Khapp (Korea Atomic Energy Research Inst., Daeduk (Korea, Republic of)); Kuk, Il Hiun; Kim, Whung Whoe; Paik, Hae Seung; Im, Kyung Soo; Oh, Seok Jin. Korea Atomic Energy Research Inst., Daeduk (Korea, Republic of). Feb 1992. 152p. (In Korean). Order Number DE93605320. Source: OSTI; NTIS (US Sales Only); INIS.

A new silicothermic process for making SiC whisker was studied. By heating for 1 hour at 1,500 deg C SiO_2-Si compact showed 71.56% weight loss. Such a reduction in weight attributed to the high reactivity of the compact. When SiO_2-Si compact was covered by coarse ceramic granule layer, SiC whiskers were formed on surface of the ceramic granules. This new method is named a peach process. Among various C-containing source gases, hydrocarbon gases, such as methane, exhibited active whisker growth. Development of a new metallic composite reinforced with SiC whiskers was tried using zircaloy. (Author).

1069 (LA-UR–92-3003) **Ceramics models in the MESA codes.** Mandell, D.A.; Henninger, R. Los Alamos National Lab., NM (United States). [1992]. 24p. Sponsored by Department of Defense, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-921162–9: Hypervelocity impact symposium, Austin, TX (United States), 17-20 Nov 1992). Order Number DE93000683. Source: OSTI; NTIS (US Sales Only); GPO Dep.

We have implemented two ceramics models into the MESA Eulerian finite difference hydrocodes and evaluated them by comparing code predictions of the free surface velocity as a function of time to data for one-dimensional flyer plate impacts and to free surface velocity data for the penetration of subscale tungsten rods into ceramic plates. Results were obtained for silicon carbide, boron carbide, alumina, alumina, titanium diboride, and for a base calculation using a steel plate.

1070 (LA-UR–92-3022) **NQR study of local structures and cooling rate dependent superconductivity in $La_2CuO_{4+\delta}$.** Reyes, A.P. (Los Alamos National Lab., NM (United States)); Ahrens, E.T.; Hammel, P.C.; Heffner, R.H.; Thompson, J.D.; Canfield, P.C.; Fisk, Z.; Schirber, J.E. Los Alamos National Lab., NM (United States). [1992]. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-921201–2: 36. conference on magnetism and magnetic materials, Houston, TX (United States), 1-4 Dec 1992). Order Number DE93000680. Source: OSTI; NTIS; GPO Dep.

Structural properties of oxygen-annealed polycrystals of $La_2CuO_{4+\delta}$ ($\delta \sim 0.03$) have been studied using ^{139}La NQR spectroscopy. Superconducting critical temperatures were found to depend on the rate of cooling through a narrow temperature range at about 195K. Preliminary analysis of the ^{139}La NQR spectra suggest that the oxygen-rich phase-separated region is composed of two structurally distinct phases, both of which are metallic and super-conducting. One phase has a structure closely related to the stoichiometric oxygen-poor compound. The second shows a considerable amount of apical oxygen disorder, a large shift in NQR frequency ν_Q, and a volume fraction which increases with cooling rate. The formation of the second phase below –200K is indicative of the freezing Of CuO_6 octahedral tilting. Abrupt shifts in ν_Q above $T_c$were also observed for both phases, suggestive of a local structural anomaly or charge transfer to the Cu-O plane.

1071 (LA-UR–92-3069) **Transport and magnetization critical current densities in $TlBa_2Ca_2Cu_3O_x$ tapes.** Willis, J.O.; Maley, M.P.; Kung, P.J.; Coulter, J.Y.; Peterson, D.E.; Wahlbeck, P.G.; Bingert, J.F.; Phillips, D.S. Los Alamos National Lab., NM (United States). [1992]. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-920802–17: Applied superconductivity conference, Chicago, IL (United States), 23-28 Aug 1992). Order Number DE93000651. Source: OSTI; NTIS; INIS; GPO Dep.

The powder in tube process was used to produce silver-sheathed tapes of $TlBa_2Ca_2Cu_3O_{8+x}$ (Tl-1223). The powder was produced by thalliating a precursor powder mixture to produce the Tl-2223 phase and then beating to drive off excess Tl and reach the Tl-1223 stoichiometry. The tapes were rolled and pressed, each step followed with a 3 h sintering. The 200 μm thick tapes show little sign of texturing; however, the critical current shows a small (~50%) dependence on the direction of the applied magnetic field. Both transport and magnetization measurents indicate relatively strong pinning at high temperatures. The 75 K self field critical current density is 62 MA/m^2. Transport measurements reveal the presence of weak links at all temperatures, but with a relatively weak field dependence above ≈0.1T.

1072 (LA-UR–92-3086) **Summary of phase separation, structure and superconductivity in super-oxygenated $La_2CuO_{4+\delta}$.** Hammel, P.C.; Ahrens, E.T.; Reyes, A.P.; Thompson, J.D.; Fisk, Z.; Canfield, P.C.; Schirber, J.E. Los Alamos National Lab., NM (United States). [1992]. 18p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-9205236–4: Conference on phase separation in cuprate superconductors, Sicily (Italy), 6-12 May 1992). Order Number DE93000855. Source: OSTI; NTIS; INIS; GPO Dep.

We report the measurements of the excess content in oxygen-annealed $La_2CuO_{4+\delta}$. Below the phase separation temperature, TpS, Several features of the phase diagram for this material are unusual. The oxygen content changes discontinuously in both the oxygen-poor and oxygen-rich phases. Below this temperature, these change very little. We propose that the phase separation temperature is determined by the excess content of the oxygen-poor (antiferromagnetic) phase which in turn determines the Neel temperature. Phase separation occurs when the resulting sublattice magnetization is approximately 1/2 the zero temperature value. Bulk magnetization measurements show that the superconducting $T_c$is dependent on the cooling rate in a narrow temperature range well separated from TpS. This and nuclear quadrupole resonance (NQR) provide evidence for the role of temperature dependent structural changes in this effect. The possible role of such changes in determining the normal state properties and the superconductivity is discussed.

1073 (LA-UR–92-3188) **Magnetic hysteresis and flux creep of $YBa_2Cu_3O_x$ grown by the melt-powder-melt-growth (MPMG) process.** Kung, P.J. (Los Alamos National Lab., NM (United States)); McHenry, M.E.; Maley, M.P.; Willis, J.O.; Murakami, M.; Tanaka, S. Los Alamos National Lab., NM (United States). 24 Aug 1992. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-920802–19: Applied superconductivity conference, Chicago, IL (United States), 23-28 Aug 1992). Order Number DE93000870. Source: OSTI; NTIS; GPO Dep.

Magnetic hysteresis and flux creep of melt-powder-melt-growth (MPMG) $YBa_2Cu_3O_x$ containing nominal 0, 25 and 40 mole% Y_2BaCuO_5 (21 1) were measured in the temperature range of 5 to 80 K and in magnetic fields up to 5 T. With the introduced fine dispersion of second phase 211 particles, the critical magnetization current density J_c shows a weak field dependence over a wide range of temperature, and the effective pinning energy U_{eff} is much enhanced. From these results, a functional expression $U_{eff}(J,T) = -U_o\, G(T)\, (J\,|J_i)^n$ is obtained, where $G(T) = [1 - (T|T_x)^2]^2$ with Tx = 82.5 K near the irreversibility temperature. The observed power-law relationship of $U_{eff}(J, T)$ clearly demonstrates two of three regimes as predicted by the theory of collective flux creep, namely n = 3/2 and 7/9 for $J < J_c$ and $J \ll J_c$, respectively. In addition, the divergence of U_{eff} at low current densities also suggests the existence of a vortex-glass state.

1074 (LBL–32258) **Crystalline growth of wurtzite GaN on (111) GaAs.** Ross, J. (California Univ., Berkeley, CA (United States). Dept. of Electrical Engineering and Computer Sciences); Gustafson, T.K.; Rubin, M. Lawrence Berkeley Lab., CA (United States). Dec 1991. 6p. Sponsored by USDOE, Washington, DC (United States); National Science Foundation, Washington, DC (United States). DOE Contract AC03-76SF00098. Contract 1-442427-21482. (CONF-911202–85: Annual fall meeting of the Materials Research Society, Boston, MA (United States), 2-6 Dec 1991). Order Number DE92041165. Source: OSTI; NTIS; GPO Dep.

Gallium Nitride films were grown on (111) gallium arsenide substrates using reactive rf magnetron sputtering. Despite a 20% lattice mismatch and different crystal structure, wurtzite. Heteroepitaxy was observed for growth temperatures between 550-600°C. X-ray diffraction patterns revealed (0002) GaN peak with a full-width-half-maximum (FWHM) as narrow as 0.17°. Possible surface reconstructions to explain the epitaxial growth are presented.

1075 (LBL–32510) **Temperature history and microstructure of alumina.** Lin, Jiang Tsair. Lawrence Berkeley Lab., CA (United States). May 1992. 116p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00098. Order Number DE92041196. Source: OSTI; NTIS; GPO Dep.

A simple process for the attainment of fully dense and improved microstructure for Al_2O_3 ceramics has been developed. Pure, narrow size distribution, submicron powder is used. Homogenization heat treatment of Al_2O_3 powder compacts at 800°C for 50 hours produces more uniform pore structure and higher green strength. Pore size distribution becomes narrower. Near fully dense, fine-grained (< 1.2μm) and uniform grain size-distribution, undoped Al_2O_3 ceramics can be produced using a high quality powder, a high-pressure cold isostatic forming method, and a two-step sintering technique. Improvements in the microstructure of Al_2O_3 ceramics homogenized at 800°C/50 h include a smaller pore size and a more uniform pore size distribution. Prevention of differential densification in the early stages and delay of pore channel closure to the later stages of sintering are believed to be the primary mechanisms for the microstructure improvement in two-step sintering. Two-step sintering is an alternate way to improve the microstructure of Al_2O_3 ceramics compared to fast firing or MgO doping. When a homogenization heat treatment and the fast firing are combined, the final density is higher than from fast firing alone. However, the two-step sintering technique is simple and there is no size limit. Generalization of two-step sintering to more systems is needed. For 250 ppM MgO-doped Al_2O_3 ceramics, homogenization of powder compacts at 800°C for 50 hours produces 0.80μm. This improvement is explained by the distribution of MgO becoming more uniform during the homogenization heat treatment, which enhances the effectiveness of MgO doping.

1076 (LBL–32513) **Simulation of vortex-line pinning by defects in the Y-Ba-Cu-O system.** Jamison, R. (Lawrence Berkeley Lab., CA (United States)); Burmester, C.P.; Gronsky, R.; Wille, L.T. Lawrence Berkeley Lab., CA (United States). Mar 1992. 6p. Sponsored by USDOE, Washington, DC (United States); Department of Defense, Washington, DC (United States); Postal Service, Washington, DC (United States). DOE Contract AC03-76SF00098. Grant MDA972-88-J-1002. (CONF-920402–59: Material Research Society spring meeting, San Francisco, CA (United States), 27 Apr - 2 may 1992). Order Number DE92041185. Source: OSTI; NTIS; GPO Dep.

The temperature properties of a two-dimensional flux lattice are studied by Monte Carlo simulation, with particular attention to the effects of twin-boundaries. The parameters selected are appropriate for the $YBa_2CU_30_7$ high-temperature superconducting system. The intrinsic properties of the vortex state are investigated by monitoring system evolution at fixed temperature and applied magnetic field. By varying the temperature, the loss of type-II superconductivity via fluxoid lattice melting is also examined. The introduction of model defects induces the creation of metastable and glassy states which reduce overall hexane order but are found to enhance system resistance to flux-lattice melting.

1077 (LBL–32689) **Interaction in polysilazane/SiC powder systems.** Boiteux, Y.P. Lawrence Berkeley Lab., CA (United

States). Jul 1992. 121p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00098. Order Number DE92041178. Source: OSTI; NTIS; GPO Dep.

Consolidation of ceramic precursor ceramic powder systems upon heating is investigated. A polysilazane (silicon nitride precursor) is chosen as ceramic precursor with a filler of a sub-micron SiC powder. A scheme to optimize the volume fraction of precursor is developed in order to maximize the density of the compacted samples in the green state. Different techniques are presented to improve the homogeneity of precursor distribution in the mixture. A microencapsulation technique is developed that leads to a uniform coating of precursor on individual SiC particles. Upon pyrolysis of systems with 20 wt% polysilazane, little shrinkage occurs. The SiC particles do not coarsen during the heat treatment. The precursor, upon pyrolysis, transforms into an amorphous ceramic phase that acts as a cement between SiC particles. This cement phase can remain amorphous up to 1500°C; and is best described as a siliconoxycarbide with or without traces of nitrogen. Elimination of nitrogen in the amorphous phase indicates that the filler material (SiC) has a strong influence on the pyrolysis behavior of the chosen polysilazane. The amorphous ceramic phase may crystallize between 1400 and 1500°C, and depending on the nature of the gas environment, the crystalline phases are SiC, Si or Si_3N_4. Mechanisms explaining the strength increase upon heat treatment are proposed. Redistribution of the precursor occurs by capillary forces or vapor phase diffusion and recondensation of volatile monomers. The confined pyrolysis of the precursor results in an increase of residual ceramic matter being decomposed inside the sample. Interfacial reaction between the native silica-rich surface layer on SiC particles and the precursor derived phase explains the high strength of the materials.

1078 (SAND–92-1878C) **Energy distribution of trapped holes in irradiated SiO_2.** Fleetwood, D.M.; Miller, S.L. Sandia National Labs., Albuquerque, NM (United States). [1992]. 3p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. (CONF-921226–2: 1992 Institute of Electrical and Electronic Engineers (IEEE) semiconductor interface specialists conference, San Diego, CA (United States), 9-13 Dec 1992). Order Number DE92040979. Source: OSTI; NTIS; GPO Dep.

There is a discrepancy between literature estimates of trapped-hole energies in irradiated SiO_2 obtained via thermal and optical methods (0.6-1.4 eV and 3 eV, respectively). A method has been developed for obtaining an improved estimate of the energy distribution of trapped holes in irradiated SiO_2, which brings thermal and optical estimates into much closer agreement. Experimental and theoretical TSC (thermally stimulated current) spectra are shown for a soft MOS capacitor with a 350-nm oxide cycled through 4 irradiations (10 keV x rays) and TSC measurements. Four trap-energy distributions were also independently derived from TSC at different ramp rates for a 45-nm radiation-hardened oxide. The trap distributions inferred from TSC for the 45-nm hard oxide agree with each other and with that inferred for the soft 350-nm oxide. 2 figs, 8 refs. (DLC)

1079 (CEA-CONF–10989) **Early phyllosilicates formed by alteration of R7T7 glass in water at 250 deg C.** Vernaz, E. (CEA Centre d'Etudes de la Vallee du Rhone, 30 - Marcoule (France). Dept. des Procedes de Retraitement); Dussossoy, J.L.; Caurel, J.; Crovisier, J.L. CEA Centre d'Etudes de la Vallee du Rhone, 30 - Marcoule (France). Dept. des Procedes de Retraitement. 1991. 16p. (CONF-911123–: 15. international symposium on the scientific basis for nuclear waste management, Strasbourg (France), 5-8 Nov 1991). Order Number DE93720911. Source: OSTI; NTIS (US Sales Only); INIS.

T7T7 glass samples have been altered during periods of one and seven days at 250 deg C in distilled water. Ultramicrotomic thin sections were performed in the outermost part of the glass for a study under analytical transmission electron microscope. After one day the alteration layer is about 5 μm thick. It is made up of sheeted silicated particles, tentatively identified as septechlorite (7 A intervals) mixed with an intercrystalline amorphous matrix of different composition. After seven days the alteration layer is about 11 μm thick. It is made up of sheeted silicated particles of smectite type (10 A intervals). No 7 A particles were found in the seven days sample. This study illustrates the capacity of poorly crystalline phyllosilicates to adapt to the chemical changes in solution. 15 refs., 4 tabs., 2 plates.

1080 (CEA-CONF–10990) **Experimental alteration of R7T7 glass in salt brines at 90 deg C and 150 deg C.** Godon, N. (CEA Centre d'Etudes de la Vallee du Rhone, 30 - Marcoule (France). Dept. des Procedes de Retraitement); Vernaz, E.; Gin, S.; Beaufort, D.; Thomassin, J.H. CEA Centre d'Etudes de la Vallee du Rhone, 30 - Marcoule (France). Dept. des Procedes de Retraitement. 1991. 15p. (CONF-911123–: 15. international symposium on the scientific basis for nuclear waste management, Strasbourg (France), 5-8 Nov 1991). Order Number DE93720912. Source: OSTI; NTIS (US Sales Only); INIS.

Static experiments have been developed to investigate the R7T7 glass corrosion in four natural salt brines (brines 1 and 3: pure halite, brines 2 and 4: high Mg, K fluid inclusions rich halite), at 90 deg C and 150 deg C with 0.7 cm^{-1} S/V ratio and at 11 different running times. Analysis of brines after alteration (pHmeter and ICP) added to a detailed study of the crystalline phases developed at the interface glass-brine (XRD,SEM and Microprobe), showed that the influence of the compositional difference is more important on the nature of the secondary phases formed than on the corrosion rate of the glass. After 91 days of alteration at 150 deg C stady states to be reached (after 40 days at 90 deg C). A long term experiment (1 year) is necessary to confirm this hypothesis. 7 refs., 7 figs., 2 tabs.

1081 (CEA-CONF–10991) **Effect of surface finish on nuclear glass dissolution rate.** Dussossoy, J.L. (CEA Centre d'Etudes de la Vallee du Rhone, 30 - Marcoule (France). Dept. des Procedes de Retraitement); Vernaz, E.; Dubois, C.; Chambaudet, A. CEA Centre d'Etudes de la Vallee du Rhone, 30 - Marcoule (France). Dept. des Procedes de Retraitement. 1991. 7p. (CONF-911123–: 15. international symposium on the scientific basis for nuclear waste management, Strasbourg (France), 5-8 Nov 1991). Order Number DE93720913. Source: OSTI; NTIS (US Sales Only); INIS.

The influence of the surface finish on nuclear glass dissolution was investigated. Seven different surface finishes were tested: a specimen as cut four specimens polished to grades 220, 600, 4000 and 1 μm, a flame-polished specimen and a thermal rupture specimen. The initial glass corrosion rates were measured after 7 and 28 days of Soxhlet leaching at 100 deg C. The surface finish of each glass coupon was also assessed by three-dimensional analysis before and after leaching for 28 days. Leaching solution analyses showed that the mean apparent leach rate for the first 7 days was highly dependent on the surface finish: the measured rates ranged from 3.8 $g.m^{-2}d^{-1}$ for the as-cut specimen to 1.3 $g.m^{-2}d^{-1}$ for the flame-polished specimen. The differences in the leach rates diminished considerably after 28 days of leaching: the mean rate measured between 7 and 28 days for the as-cut and polished specimens was identical (1.7 $g.m^{-2}d^{-1}$), but was still lower for the remaining two specimens. Three-dimensional surface analysis showed that leaching revealed surface defects (superficial microcracks) produced by cutting or polishing. These effects were less perceptible on the flame-polished or thermally ruptured specimens. The actual surface area of the cut and polished specimens exceeded the apparent geometrical area. In another experiment, the leach rates measured for as-cut specimens and flame-polished specimens were measured over periods of five months or more using a thermogravity balance placed above the Soxhlet device. The experiment confirmed the existence of an initial period during which the dissolution rate for the as-cut specimen was much higher than the mean corrosion rate. 4 refs., 3 figs., 2 tabs.

1082 (CEA-CONF–10992) **Effect of platinoids on French LWR reference glass properties.** Pacaud, F.; Fillet, C.; Jacquet-Francillon, N. CEA Centre d'Etudes de la Vallee du Rhone, 30 - Marcoule (France). Dept. des Procedes de Retraitement. 1991. 7p.

(CONF-911123–: 15. international symposium on the scientific basis for nuclear waste management, Strasbourg (France), 5-8 Nov 1991). Order Number DE93720914. Source: OSTI; NTIS (US Sales Only); INIS.

Nine samples of the 'R7T7' glass composition selected to vitrify fission product solutions in France were prepared with added platinoid elements (ruthenium, rhodium and palladium) in soluble form and as insoluble metal particles in solution, and their major properties were measured. Regardless of the initial form when added to the glass the platinoids always formed the same heterogeneous inclusions in the final glass: RuO_2 precipitates which were often found as aggregates, and polymetallic (Pd, Rh and Te) inclusions. The particles tended to settle in the molten glass. The viscosity increased by about 20% at 1100 deg C. The mechanical properties and short-term leach rates were not significantly affected. Crystallization increased by a factor of 2 or 3 in heat-treated glass specimens but did not exceed a few volume percent. However, as the short-term leach rate did not significantly increase, the glass properties were very satisfactory.

1083 (CEA-CONF–10993) **R7T7 glass alteration in the presence of mortar: effect of the cement grade.** Andriambololona, Z.; Godon, N.; Vernaz, E. CEA Centre d'Etudes de la Vallee du Rhone, 30 - Marcoule (France). Dept. des Procedes de Retraitement. 1991. 8p. (CONF-911123–: 15. international symposium on the scientific basis for nuclear waste management, Strasbourg (France), 5-8 Nov 1991). Order Number DE93720915. Source: OSTI; NTIS (US Sales Only); INIS.

R7T7 glass alteration was investigated in the presence of four mortars prepared from four different cement grades: 'CPA' Portland cement (mortar M1), CPA with pozzolana additive (M2), CPA with amorphous silica additive (M3) and 'CLK' blast furnace slag cement (M4). Glass specimens were also altered in Volvic mineral water and in a cement effluent. Glass corrosion in the cement media was greater than in Volvic water, but well below what could be expected from the high pH (approx 12.5). The relatively low alteration was probably related to the protective action of the calcium-enriched gel layer that formed at the glass surface. The glass corrosion rate was 2 to 3 times lower with cement containing pozzolana or silica gel additives or with CLK cement than with CPA cement alone. 8 refs., 8 figs.

1084 (CEA-CONF–11028) **Electric field dependent paramagnetic defect creation in single step implanted Simox films.** Leray, J.L. (CEA Centre d'Etudes de Bruyeres-le-Chatel, 91 (France)); Margail, J.; Devine, R.A.B. CEA Centre d'Etudes de Bruyeres-le-Chatel, 91 (France). 1991. 12p. (CONF-911109–: Fall meeting of the European Materials Research Society, Strasbourg (France), 5-8 Nov 1991). Order Number DE93721148. Source: OSTI; NTIS (US Sales Only); INIS.

X irradiation induced oxygen-vacancy defect creation has been studied in SIMOX produced by single step implantation and annealing. It is shown that SIMOX is substantially more radiation sensitive (for these defects) than thermal or bulk oxide. Irradiation in the presence of an electric field 0.5 - 1 MV cm^{-1} is found to enhance the rate of defect creation by $\geq$ 2 times. Further enhanced defect creation is observed in SIMOX samples whose substrate has been chemically thinned prior to irradiation. This enhancement is attributed to modification of the network induced by hydrogen introduced during the thinning process.

1085 (CONF-9208129–3) **Combined small-angle neutron and x-ray scattering studies of polymers.** Wignall, G.D. Oak Ridge National Lab., TN (United States). [1992]. 19p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From 41. annual Denver x-ray conference; Denver, CO (United States); Aug 1992. Order Number DE93000440. Source: OSTI; NTIS; GPO Dep.

Over the past two decades, small-angle neutron scattering (SANS), using cold neutrons (4-20 Å), has proven to be an important tool for the evaluation of polymer chain conformation. Due to a fortuitous combination of several factors (penetrating power, deuteration, solvent choice), SANS has developed into a very powerful tool for the study of polymers. This article focuses on the information provided by SANS and demonstrates how it has complemented and expanded upon the data available from other scattering techniques (e.g., SAXS). Applications to homogenous polymer mixtures, phase-separated polymer blends, and carbon-filled polymers are discussed. 34 refs, 18 figs, 2 tabs. (DLC)

1086 (CONF-9209207–1) **Unsolved problems of crystallization and melting of flexible macromolecules: Attempts at the understanding of the molecular process by experiments and computer simulation.** Wunderlich, B. (Tennessee Univ., Knoxville, TN (United States). Dept. of Chemistry). Oak Ridge National Lab., TN (United States). [1992]. 12p. Sponsored by USDOE, Washington, DC (United States); National Science Foundation, Washington, DC (United States). DOE Contract AC05-84OR21400. Grant DMR 92-00520. From NATO workshop on crystallization of polymers; Mons (Belgium); 6-12 Sep 1992. Order Number DE92040876. Source: OSTI; NTIS; INIS; GPO Dep.

The thermodynamics, kinetics, and computer simulations of crystallization and melting is discussed. The thermodynamics is shown to be well understood, although for many specific crystals not enough details for full description are available. Experiments on the crystallization kinetics of poly(ethylene) and poly(oxyethylene) in the presence of crystal nuclei as a function of molecular mass revealed that with increasing mass, the crystallization behavior deviates increasingly from that of small, rigid molecules. Instead of showing a continuously changing, linear crystallization rate with temperature through the equilibrium melting temperature, T_m^0, these flexible macromolecules show a region of practically zero crystallization rate between T_m^0 and about (T_m^0 - 15) K, creating a temperature region of metastability in the melt that cannot be broken by nucleation with pregrown crystals. Molecular Nucleation was proposed as a cooperative process to be of overriding importance for the description of polymer crystallization, and to be at the center of segregation of molecules of lower molecular mass by growing crystal fronts. Initial efforts to model sufficiently large crystals using Monte Carlo and molecular dynamics methods are presented. Some of the short-time intermediates in the melting, crystallization, and annealing processes seem to have little similarity to commonly assumed models of crystallization and melting and are presented as discussion topics.

1087 (DOE/CE/23810–3B) **Chemical and thermal stability of refrigerant-lubricant mixtures with metals: Quarterly report, 1 April 1992–30 June 1992.** Huttenlocher, D.F. Spauschus Associates, Inc., Atlanta, GA (United States). 10 Jul 1992. 63p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-91CE23810. Order Number DE93000537. Source: OSTI; NTIS; GPO Dep.

This report presents completed sealed tube stability test results for the following eight refrigerant/lubricant mixtures: R-22/mineral oil; R-124/alkylbenzene; R-134a/pentaerythritol (PE) ester (mixed acid); R- 134a/PE (branched acid); R-134a/PE (100 cSt viscosity); R- 142b/alkylbenzene; R-143a/PE (branched acid); R-152a/alkylbenzene. Partial results are shown for an additional eight refrigerant-lubricant mixtures. Though work is in progress, no data are available at this point in time for the five remaining test mixtures. Reported are: visual observations on aged sealed tubes, gas chromatographic analyses on the vapor phase contents of the tubes, chloride ion contents of HCFC containing mixtures or fluoride ion contents of HFC mixtures, and total acid number values and infrared analysis results for mixtures containing ester lubricants.

1088 (DOE/CE/23810–3C) **Miscibility of lubricants with refrigerants: Quarterly report, 1 April 1992–30 June 1992.** Pate, M.B.; Zoz, S.C.; Berkenbosch, L.J. Iowa State Univ. of Science and Technology, Ames, IA (United States). Dept. of Mechanical Engineering. Jul 1992. 20p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-91CE23810. Order Number DE93000538. Source: OSTI; NTIS; GPO Dep.

Miscibility data is being obtained for a variety of non-CFC refrigerants and their potential lubricants. Ten different refrigerants and seven different lubricants are being investigated. Experiments are being performed in two phases: Phase I focuses on performing screening tests and Phase II consists of developing miscibility plots. The miscibility tests are being performed in a test facility consisting of a series of miniature test cells submerged in a constant temperature bath. The bath temperature can be precisely controlled over a temperature range of -50°C to 100°C. The test

cells are constructed to allow for complete visibility of lubricant-refrigerant mixtures under all test conditions. Early in this reporting period, new procedures for charging the lubricant and refrigerant into the cells for testing were adopted. All of the refrigerants and all but one of the lubricants have been received from the manufacturers. Data obtained to date includes that for R-134a, R142b, R-32, R-134, R-125, and R-143a with four lubricants, namely, two esters and two polypropylene glycols.

1089 (DOE/CE/23810–3D) **Compatibility of refrigerants and lubricants with motor materials: Quarterly technical progress report, April 1, 1992–June 30, 1992.** Doerr, R.; Kujak, S. Trane Co., La Crosse, WI (United States). 23 Jul 1992. 18p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-91CE23810. Order Number DE93000540. Source: OSTI; NTIS; GPO Dep.

During this last quarter, evaluations were complete on the motor materials after 500-hr exposures to refrigerants CFC-123, HFC-134a and HCFC-22 at 90°C. Materials were also evaluated after exposure to nitrogen at 127°C to determine effect of the thermal exposure. Other exposures were started during this quarter with refrigerants HCFC-124, HFC-125, HFC-143a, HFC-32 and HFC-152a. One 500 hr exposure is set up per week and one is analyzed the same week. This will enable Trane to complete the 500 hour exposures by the end of the year.

1090 (DOE/CE/23810–3E) **Compatibility of refrigerants and lubricants with elastomers: Quarterly report, 1 April 1992–30 June 1992.** Hamed, G.R.; Seiple, R.H. Akron Univ., OH (United States). Inst. of Polymer Science. Jul 1992. 236p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-91CE23810. Order Number DE93000539. Source: OSTI; NTIS; GPO Dep.

Information contained in this reporters designed to assist the air-conditioning and refrigeration industry in the selection of suitable elastomeric gasket and seal materials that will prove useful in various refrigerant and refrigeration lubricant environments. Swell measurements have been made on approximately 50% of the proposed elastomers (94 total)in both the lubricant (7 total) and refrigerant (10 total) materials. Swell behavior in the these fluids have been determined using weight and in situ diameter measurements for the refrigerants and weight. diameter and thickness measurements for the lubricants. Weight and diameter measurements are repeated after 2 hours and 24 hours for samples removed from the refrigerant test fluids and 24 hours after removal from the lubricants.

1091 (DOE/CE/23810–3F) **Compatibility of refrigerants and lubricants with engineering plastics: Quarterly report, 1 April 1992–30 June 1992.** Cavestri, R.C. Imagination Resources, Inc., Dublin, OH (United States). Jul 1992. 25p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-91CE23810. Order Number DE93000541. Source: OSTI; NTIS; GPO Dep.

All seven oil immersion studies are complete at both temperatures. Nine out of ten refrigerant ambient immersion studies are complete including 60C (140F) for R-123. All 22 plastic test materials have been molded into test bars. All test bars have been quality controlled for physical consistency and integrity. All 22 test chambers are functional. Creep loads have been increased to 25% of ultimate tensile. Refrigerant has solubilities of Emery 2927 with R-22 and 134a are complete.

1092 (DOE/CH/10204–T1) **Localized excitations in amorphous silicon alloys: Final report.** Morehouse Coll., Atlanta, GA (United States). Oct 1987. 34p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-84CH10204. Order Number DE93001790. Source: OSTI; NTIS; GPO Dep.

The valence band edge of a-Si:H is sensitive to H content, while the conduction band edge is not. The optical gap increases 50% going from the isolated SiH group to the polysilane configuration; the smallest energy gap was for the polycrystal models for a-Si:H. Only the complexes involving the Si dangling bond give rise to active states deep in he a-Si fundamental energy gap. Positions of dangling bond defect state agree with photoluminescence of undoped and oxidized a-Si:H films. Incorporation of halogens into a-Si:H increases the optical gap, quasi-localized states near conduction band tail, and resonances deep in the valence band. Carbon increases the optical gap and produces resonances deep in both bands, while tin does not increase the optical gap and produces resonances in upper part of a-Si:H valence band; this is consistent with a model based on relative strength of Si-Si bond to Si-impurity bond. Effects of P dopant are consistent with models based on P in a-Si:H producing dopant-defect pairs, increased Fermi energy, etc. B substitutional dopants (tetrahedral) produces states near the valence band edge which resemble the show impurity levels in crystalline Si. Trigonally bonded B gives rise to states within the a-Si:H fundamental gap. B-H complexes suggest B-H bonds in B-doped a-Si:H, even at low B contents. Figs, 22 refs. (DLC)

1093 (DOE/ER/13433–4) **Thermal plasma processing of materials: Progress report, September 1, 1988–January 31, 1992.** Pfender, E.; Heberlein, J. Minnesota Univ., Minneapolis, MN (United States). Dept. of Mechanical Engineering. Feb 1992. 33p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-85ER13433. Order Number DE93003118. Source: OSTI; NTIS; GPO Dep.

Emphasis has been on plasma synthesis of fine powders, plasma Chemical Vapor Deposition (CVD), on related diagnostics, and on modeling work. Since plasma synthesis as well as plasma CVD make frequent use of plasma jets, the beginning has been devoted of plasma jets and behavior of particulates injected into such plasma jets. Although most of the construction of the Triple-Torch Plasma Reactor (TTPR) has already been done, modifications have been made in particular modifications required for plasma CVD of diamond. A new reactor designed for Counter-Flow Liquid Injection Plasma Synthesis (CFLIPS) proved to be an excellent tool for synthesis of fine powders as well as for plasma CVD. An attempt was made to model flow and temperature fields in this reactor. Substantial efforts were made to single out those parameters which govern particle size, size distribution, and powder quality in our plasma synthesis experiments. This knowledge is crucial for controlling the process and for meaningful diagnostics and modeling work. Plasma CVD of diamond films using both reactors has been very successful and we have been approached by a number of companies interested in using this technology for coating of tools.

1094 (DOE/ER/45314–5) **Plasma, photon, and beam synthesis of diamond films and multilayered structures: Progress report, July 1, 1990–September 1992.** Chang, R.P.H. Northwestern Univ., Evanston, IL (United States). Dept. of Materials Science and Engineering. Sep 1992. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-87ER45314. Order Number DE93001749. Source: OSTI; NTIS; GPO Dep.

In the area of nucleation, it was discovered that C_{70} thin films are perfect substitutes for diamond seeds in the growth of diamond films. This research, along with a careful study of diamond growth on carbon ion implanted single crystal copper, have clearly demonstrated that structured carbon is the best precursor for nucleation and growth of diamond films on non-diamond surfaces. In addition, by using fluorine chemistry during diamond growth, it has been shown that diamond films can grow on carbide substrates without the pretreatment of diamond seeding. The growth rates are higher and the film adhesion is much improved.

1095 (DOE/ER/45419–3) **Role of structure in ion movement of glasses: Progress report, January 5, 1992–November 1, 1992.** Jain, H. Lehigh Univ., Bethlehem, PA (United States). 3 Nov 1992. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-90ER45419. Order Number DE93001844. Source: OSTI; NTIS; GPO Dep.

Three kinds of experiments were performed: modified random network model and ion movement; role of melt structure in ion transport in glassy state; and ion movement in fluorozirconate glass (breakdown of correspondence between electrical and nuclear spin relaxation). A comment is offered on dielectric loss peak in glasses. 11 refs, 1 fig. (DLC)

1096 (DOE/ID/12692–3) **Dual cure solventless coating process: Phase 3, Semiannual technical report, October 1, 1991–March 1992.** Minnesota Mining and Mfg. Co., St. Paul, MN

(United States). Corporate Research Labs. Oct 1992. 47p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-88ID12692. Order Number DE93001352. Source: OSTI; NTIS; GPO Dep.

The objective of Phase III of 3M's contract with the US Department of Energy is to complete proof-of-principle testing in full-scale systems of the dual cure photocatalyst technology developed in earlier Phases of the program. The Phase III commercial applications to be demonstrated are aerospace topcoats, aerospace primers, and solventless manufacture of tape backings. Work has been initiated in all three applications. Significant progress has been made in improving the performance of the urethane/acrylate formulation being used for the aerospace topcoat application. Key improvements have been made in obtaining reliable coating cure and increasing reverse impact and gloss performance. A subcontract has been initiated with Boeing Defense and Space Group to perform testing of candidate 3M topcoat formulations in accordance with various military and commercial specifications. Technical challenges are being encountered with the aerospace primer formulation. Efforts to date have focused on establishing a good baseline epoxy/acrylate formulation with reliable cure conditions. Work on the third demonstration application, development of solventless backing saturants for electrical tape backings, has progressed well. Since the start of the program, evaluation of various backing substrates has been completed, initial resin formulations developed and optimized, and preparation of samples of complete tape constructions using dual cure backings.

1097 (FRCEA-TH–368) **Methods for the preparation of ultra-pure anhydrous zirconium tetrafluoride from zirconium tetraborohydride, researches in connection with halide glasses.** Tortevois, R. CEA Centre d'Etudes Nucleaires de Saclay, 91 - Gif-sur-Yvette (France). Direction des Sciences de la Matiere; Paris-6 Univ., 75 (France). 15 Mar 1990. 173p. (In French). Order Number DE93721140. Source: OSTI; NTIS (US Sales Only); INIS.

The synthesis of ultrapure zirconium tetrafluoride, the main component of fluorozirconate based optical fibers, was successfully attempted from zirconium tetraborohydride. Of the fluorinating agents used, nitrogen trifluoride doesn't react with zirconium tetraborohydride while xenon difluoride reacts too violently and leads to phases which contain boron. The fluorination in a compatible solvent enabled us to minimize the degradation. The best results were obtained with the fluorination of $Zr(BH_4)_4$ dissolved in $CFCl_3$ at -40 deg C by anhydrous HF. Using several analytical methods such as graphite furnace atomic absorption and proton activation, we analyzed the purity. The degree of transition element impurities is less than the ppm level for ZrF_4. The dehydration of ZrF_4,H_2O and $ZrF_4,3H_2O$ at room temperature by ClF_3 in gaseous and liquid state was also investigated. At exceptionally low temperature, this process allows oxide and oxyfluoride components to be reduced.

1098 (IC–92/197) **Melting and liquid structure of polyvalent metal halides.** Tosi, M.P. International Centre for Theoretical Physics, Trieste (Italy). Aug 1992. 25p. Order Number DE93605371. Source: OSTI; NTIS (US Sales Only); INIS.

A short review is given of recent progress in determining and understanding liquid structure types and melting mechanisms for halides of polyvalent metals. The nature of the preferred local coordination for the polyvalent metal ion in the melt can usually be ascertained from data on liquid mixtures with halogen-donating alkali halides. The stability of these local coordination states and the connectivity that arises between them in the approach to the pure melt determines the character of its short-range and possible medium-range order. A broad classification of structural and melting behaviours can be given on the basis of measured melting parameters and transport coefficients for many compounds, in combination with the available diffraction data on the liquid structure of several compounds. Correlations have been shown to exist with a simple indicator of the nature of the chemical bond and also with appropriate parameters of ionic models, wherever the latter are usefully applicable for semiquantitative calculations of liquid structure. Consequences on the mechanisms for valence electron localization in solutions of metallic elements into strongly structured molten salts are also briefly discussed. (author). 46 refs, 4 figs, 2 tabs.

This work describes and discusses Photoluminescence (PL), and X-band Photoluminescence Detected Magnetic Resonance (PLDMR) of poly(3-alkylthiophene) (P3AT) films and solutions, poly(para-phenylenevinylene) (PPV), poly(2,5-dihexoxyparaphenylenevinylene) (PDHOPV), poly(2,5-dioctoxyparaphenylenevinylene) (PDOOPV), blends of poly(2-methoxy,5-(2'ethylhexoxy)paraphenylenevinylene) (PMOE-HOPV) with polyethylene (PE) films both unoriented and oriented, and poly(2,5-dibutoxyparaphenyleneacetylene) (PDBOPA) films. The Electroluminescence Detected Magnetic Resonance (ELDMR) and Conductivity Detected Magnetic Resonance (CDMR) narrow quenching signal in PPV is also reported and discussed.

1112 (IVO-B–01/92) **Measurement of reinforcement corrosion in concrete structures.** Meuronen, A. Imatran Voima Oy (IVO), Helsinki (Finland). Mar 1992. 22p. (In Finnish). Order Number DE93711155. Source: OSTI; NTIS.

Ageing and aggressive enviromental conditions of concrete structures will result in deterioration of concrete and corrosion of steel in concrete. Corrosion of steel will in time result in the end of the service life or expensive renovations, unless corrosion of steel is noticed and renovated in time. Corrosion of steel in concrete can be found out by the present corrosion measurement methods, so that renovation can be started in right time. The report presents mainly on the basis of the literature references the following corrosion measurement methods: polarisation resistance, AC-impedance, electrical resistance probe, electrochemical noice and half-cell potential mapping. The half-cell potential mapping will be presented more precisely than the other corrosion measurement methods, for the potential mapping is the most used method. Concrete and Soils Laboratory of Imatran Voima Oy uses in the measurement of reinforcement corrosion the English, eight channel potential measuring equipment.

1113 (IVO-B–02/92) **Chloride corrosion of reinforcement and cathodic protection.** Meuronen, A.; Westerlund, E. Imatran Voima Oy (IVO), Helsinki (Finland). Mar 1992. 45p. (In Finnish). Order Number DE93711154. Source: OSTI; NTIS.

Chloride corrosion of steel in concrete may result in shortening of the service life or a premature, expensive renovation or even failure of the renovation, unless the factors of chloride corrosion are known. It is nowadays impossible to remove chlorides from concrete reliably without cutting out chloride contamined concrete layer. However, after the renovation concrete may often contain chlorides so much that corrosion of steel will start and the service life will shorten. The expected service life can be gained by renovating the structure so both the threshold value of chloride content (the value after corrosion starts) and speed of the corrosion process are taken into account in the plans. The other renovating method is cathodic protection to stop corrosion. In the beginning of the report,

chloride corrosion of steel in concrete (not in cold climate) is given on the base of the literature references and experience of renovations. Influence of binding material of concrete to threshold value and to continuation of corrosion process are presented. The proposal to the binding material quality and the minimum content of binding material are given. The end of the report presents the prerequisites to cathodic protection and designing principles.

1114 (JINR-R–11-91-371) **Finite element method for simulation of the semiconductor devices.** Zikatanov, L.T.; Kaschiev, M.S. Joint Inst. for Nuclear Research, Dubna (Russian Federation). Lab. of Computing Techniques and Automation. 1991. 12p. (In Russian). Order Number DE93605379. Source: OSTI; NTIS (US Sales Only); INIS.

An iterative method for solving the system of nonlinear equations of the drift-diffusion representation for the simulation of the semiconductor devices is worked out. The Petrov-Galerkin method is taken for the discretization of these equations using the bilinear finite elements. It is shown that the numerical scheme is a monotonous one and there are no oscillations of the solutions in the region of p-n transition. The numerical calculations of the simulation of one semiconductor device are presented. 13 refs.; 3 figs.

1115 (Juel–2606) **Microstructure of porous silicon. Optical and electron-spectroscopic investigations.** Muender, H. Forschungszentrum Juelich GmbH (Germany). Inst. fuer Schicht- und Ionentechnik; Technische Hochschule Aachen (Germany). Apr 1992. 134p. (In German). Order Number DE93720396. Source: OSTI; NTIS (US Sales Only).

Semiconductor materials were characterized by Raman spectroscopy IR spectroscopy, ellipsometry, LEED, AES, XPS, UPS and TER. The materials analyzed were GaAs/Si(100) heteroepitactic layers and porons si films. In view of the fact that doping of the substrate will affect the microescopic structure of the perons Si layers, both p-doped and p$^+$-doped materials were analyzed. Porosities varied between 36% and 75%. Further, also the effect of pre-oxidation in the physical properties of the porons strata was investigated. (orig./MM).

1116 (LBL–32388) **Optical characterization of sputtered carbon films.** Ager, J.W. III. Lawrence Berkeley Lab., CA (United States). May 1992. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00098. (CONF-9207153–1: Institute of Electrical and Electronic Engineers (IEEE) magnetic recording conference, Santa Clara, CA (United States), 21-23 Jul 1992). Order Number DE92041209. Source: OSTI; NTIS; GPO Dep.

Spattered carbon films are widely used as protective overcoats for thin film disk media. Raman spectroscopy is nondestructive and relatively rapid and is well suited for the characterization of carbon films. Specific features in the Raman spectra are empirically correlated with the rates of specific types of mechanical wear for both hydrogenated and unhydrogenated films. This observation is interpreted in terms of a random covalent network, in which the mechanical performance of the film is determined by the nature of the bonding that links sp^2-bonded domains.

1117 (LBL–32642) **The processing and potential applications of porous silicon.** Syyuan Shieh. Lawrence Berkeley Lab., CA (United States). Jul 1992. 144p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00098. Order Number DE92041195. Source: OSTI; NTIS; GPO Dep.

Stability of a cylindrical pore under the influence of surface energy is important for porous silicon (PS) processing in the integrated circuit industry. Once the zig-zag cylindrical pores of porous silicon or oxidized porous silicon (OPS) are unstable and breakup into rows of isolated spherical pores, oxidation of PS and densification/nitridation of OPS become difficult. Swing to difficulty transport of reactant gas (O_2, NH_3) or the trapped gas (for densification of OPS). A first order analysis of the stability of a cylindrical pore or cylinder is considered first. Growth of small sinusoidal perturbations by viscous flow or evaporation/condensation result in dependence of perturbation growth rate on perturbation wavelength. Rapid thermal oxidation (RTO) of porous silicon is proposed as an alternative for the tedious two-step 300 and 800C oxidation process. Transmission electron microscopy, energy dispersive spectroscopy ESCA are used for quality control. Also, rapid thermal nitridation of oxidized porous silicon in ammonia is proposed to enhance OPS resistance to HF solution. Pores breakup of OPS results in a trapped gas problem during densification. Wet helium is proposed as OPS densification ambient gas to shorten densification time. Finally, PS is proposed to be an extrinsic gettering center in silicon wafers. The suppression of oxidation-induced stacking faults is used to demonstrate the gettering ability. Possible mechanism is discussed.

1118 (ORNL/Sub–85-55901/03) **Modeling of forced flow/thermal gradient chemical vapor infiltration.** Starr, T.L. (Oak Ridge National Lab., TN (United States)); Smith, A.W. Oak Ridge National Lab., TN (United States); Georgia Tech Research Inst., Atlanta, GA (United States). Sep 1992. 37p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE93001615. Source: OSTI; NTIS; GPO Dep.

The forced flow/thermal gradient chemical vapor infiltration process (FCVI) has proven to be a successful technique for fabrication of ceramic matrix composites. It is particularly attractive for thick components which cannot be fabricated using the conventional, isothermal method (ICVI). Although it offers processing times that are at least an order of magnitude shorter than ICVI, FCVI has not been used to fabricate parts of complex geometry and is perceived by some to be unsuitable for such components. The major concern is that selection and control of the flow pattern and thermal profile for optimum infiltration can be a difficult and costly exercise. In order to reduce this effort, we are developing a computer model for FCVI that simulates the densification process for given component geometry, reactor configuration and operating parameters. Used by a process engineer, this model can dramatically reduce the experimental effort needed to obtain uniform densification. A one-dimensional process model, described in a previous interim report, has demonstrated good agreement with experimental results in predicting overall densification time and density uniformity during processing and the effect of various fiber architectures and operating parameters on these process issues. This model is fundamentally unsuitable for more complex geometries, however, and extension to two- and three-dimensions is necessary. This interim report summarizes our progress since the previous interim report toward development of a "finite volume" model for FCVI.

1119 (SAND–92-0392C) **Strained quantum well modulation-doped InGaSb/AlGaSb structures grown by molecular beam epitaxy.** Klem, J.F. (Sandia National Labs., Albuquerque, NM (United States)); Lott, J.A.; Schirber, J.E.; Kurtz, S.R.; Lin, S.Y. Sandia National Labs., Albuquerque, NM (United States). [1992]. 14p. Sponsored by USDOE, Washington, DC (United States); Department of Defense, Washington, DC (United States). DOE Contract AC04-76DP00789. Grant 88-0248. (CONF-920676–2: Electronic materials conference, Cambridge, MA (United States), 24-26 Jun 1992). Order Number DE93000755. Source: OSTI; NTIS; GPO Dep.

Strained single quantum well InGaSb/AlGaSb structures for field-effect transistor applications have been grown by molecular beam epitaxy. Modulation-doped p-type structures have been characterized by a variety of techniques, including Hall effect, Shubnikov-de Haas measurements, and cyclotron resonance. These structures exhibit improved hole transport in comparison to similar GaSb/AlGaSb structures as a result of strain-splitting of the valence band. P-channel field-effect transistors fabricated in this system exhibited a maximum transconductance of 51 and 161 ms/mm at 300 and 77K, respectively, for a 1.2μm gate-length device.

1120 (SAND–92-1813C) **Application of grazing incidence x-ray diffraction to polymer blends.** Goehner, R.P. (General Electric Co., Schenectady, NY (United States). Research and Development Center); Garbauskas, M.F.; LeGrand, D.G. Sandia National Labs., Albuquerque, NM (United States). [1992]. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. (CONF-9208129–4: 41. annual Denver x-ray conference, Denver, CO (United States), Aug 1992). Order Number DE93000709. Source: OSTI; NTIS; GPO Dep.

The physical properties of polymer blends consisting of one or more crystallizable components are affected by the microstructure of these materials. In particular, the degree of crystallinity can be

influenced by processing parameters, and the crystallinity, as well as the phase distribution, may vary as a function of depth through an injection molded part Conventional x-ray diffraction techniques can provide information regarding both phase composition and degree of crystallinity, but, because of the relative transparency of these materials to wavelengths generally available in the laboratory, these techniques provide information representative of only the bulk. By employing parallel beam optics at varying grazing incidence angles, the x-ray sampling depth can be varied without loss of resolution. This technique can be used to vary the effective analysis depth from the top several hundred angstroms for low razing incidence to centimeters for transmission diffraction patterns. Grazing incidence techniques have found initial application in the characterization of thin metallic and ceramic films. This paper demonstrates the feasibility of using parallel beam to depth profile low atomic number materials. The specific application of this optics technique to the characterization of injection molded polymers, including a blend of bisphenol-A polycarbonate (PC) and polybutylene terephthalate (PBT), will be presented.

1121 (STRIPA-TR–91-33) **Cement based grouts - longevity laboratory studies: leaching behaviour.** Onofrei, M. (AECL-Research, Pinawa, Manitoba (Canada). Whiteshell Laboratories); Gray, M.; Roe, L. Swedish Nuclear Fuel and Waste Management Co., Stockholm (Sweden). Dec 1991. 95p. Order Number DE93603538. Source: OSTI; NTIS; INIS.

This report describes a series of laboratory tests carried out to determine the possible leaching behaviour of cement-based grouts in repository environments. A reference high-performance cement-based grout, comprised of Canadian Type 50 (U.S. Type V) Sulphate Resisting Portland Cement, silica fume, potable water and superplasticizer, and a commercially available cement grout were subjected to leaching in distilled water and three simulated groundwaters of different ionic strength. Hardened, monolithic specimens of the grout were leached in static, pulsed-flow and continuous flow conditions at temperatures from 10 degrees C to 150 degrees C for periods of up to 56 days. The changes in concentration of ions in the leachants with time were determined and the changes in the morphology of the surfaces of the grout specimens were examined using electron microscopy. After a review of possible mechanisms of degradation of cement-based materials, the data from these experiments are presented. The data show that the grouts will leach when in contact with water through dissolution of more soluble phases. Comparison of the leaching performance of the two grouts indicates that, while there are some minor differences, they behaved quite similarly. The rate of the leaching processes were found to tend to decrease with time and to be accompanied by precipitation and/or growth of an assemblage of secondary alteration phases (i.e., $CaCO_3$, $Mg(OH)_2$). The mechanisms of leaching depended on the environmental conditions of temperature, groundwater composition and water flow rate. Matrix dissolution occurred. However, in many of the tests leaching was shown to be limited by the precipitated/reaction layers which acted as protective surface coatings. (37 refs.) (au).

1122 (UCRL-JC–110665) **Matrix-dominated mechanical properties of a fiber composite lamina.** Lyon, R.E.; Schumann, D.L.; DeTeresa, S.J. Lawrence Livermore National Lab., CA (United States). 18 May 1992. 24p. Sponsored by USDOE, Washington, DC (United States); Department of Defense, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-9205232–1: 11. American Society for Testing and Materials (ASTM) symposium on composite materials: testing and design, Pittsburgh, PA (United States), 4-5 May 1992). Order Number DE93001320. Source: OSTI; NTIS; GPO Dep.

Matrix-dominated mechanical properties of unidirectional fiber composite laminae were determined from hoop-wound tube specimens and cylindrical rods fabricated from both wet-filament winding and prepreg material systems. Longitudinal shear modulus and strength as well as transverse Young's modulus, transverse tensile strength, and transverse compressive strength were obtained from a thin-walled tube specimen using a new fixturing design. Lamina properties are presented for several carbon fiber/epoxy composite materials. Longitudinal shear moduli were measured for both tubes and rods in torsion. Results obtained in the linear-elastic regimes above and below the glass transition temperature (Tg) of the matrix phase were compared with micromechanics predictions. Although agreement between predicted and measured shear moduli was reasonable below Tg, large discrepancies were observed when the matrix phase was elastomeric.

1123 (UCRL-JC–111033) **Comments on transformational superplasticity: an example from a non-metal, ammonium nitrate.** Meike, A.; McLaren, A.C. Lawrence Berkeley Lab., CA (United States). Jul 1992. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-920670–5: 6. international conference on intergranular and interphase boundaries in materials, Thessaloniki (Greece), 22-26 Jun 1992). Order Number DE93001315. Source: OSTI; NTIS; GPO Dep.

Two complementary compressive creep experiments have been used to investigate potential transformation superplastic effects in polycrystalline ammonium nitrate (NH_4NO_3): a micro- deformation apparatus for in-situ observation during deformation under an optical microscope, and a bulk specimen creep apparatus for temperature gradient experiments. Results indicate that more than one experimental effect has been interpreted in the past as transformation superplasticity. We have isolated three effects that produce "anomalous weakening" that can be associated with both displacive and reconstructive transformations may operate. These multiple and possibly interdependent mechanisms suggests that transformation superplasticity operates according to a more complex constitutive flow law than has been recognized in the past.

1124 (Y/EN–4124-Rev.1) **Procedure and analysis reports in support of the hollow clay tile wall testing program: Revision 1.** Oak Ridge Y-12 Plant, TN (United States); Tennessee Univ., Knoxville, TN (United States). Nov 1990. 127p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OS21400. Order Number DE92041224. Source: OSTI; NTIS; GPO Dep.

The following are included that were generated in the research program on the structural behavior of clay tile walls: test procedure for out-of-plane full scale static testing of a hollow clay tile wall panel, ultimate strength calculations for out-of-plane air bag tests, test procedure for in-plane infilled frame static testing of a hollow clay tile wall panel, in-plane infilled frame static testing of a hollow clay tile wall panel (calculations), test procedure for in-plane masonry static testing of a hollow clay tile wall panel, numerical analysis for in-plane behavior of infilled frames, in-plane analysis of hollow clay tile infilled frames (effect of wall-frame interface and connection rigidity), test procedure for in-plane masonry biaxial compressiont esting of a hollow clay tile wall panel, and outbuilding test program. (DLC)

1125 (Y/EN–4536/V1) **Structural testing of hollow clay tile units: Volume 1.** Flanagan, R.D. (Oak Ridge Y-12 Plant, TN (United States)); Bennett, R.M. Oak Ridge Y-12 Plant, TN (United States). 5 Aug 1992. 46p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OS21400. (CNPE/HCT–12). Order Number DE92041270. Source: OSTI; NTIS; GPO Dep.

This report presents the results of laboratory testing of hollow clay tile masonry units. The testing is part of an ongoing natural phenomena evaluation program of Hollow Clay Tile Wall (HCTW) facilities at the Oak Ridge Y-12 Plant. The primary purpose of these tests is to determine structural properties of unit tiles of the same lot to be used in large-scale laboratory testing of HCTW structures. Light red (terra cotta) clay masonry units, taken from the construction supply yard of were sampled and tested in accordance with applicable ASTM standards. Measurement of size, measurement of void area, initial rate of absorption, compressive strength, and splitting tensile strength procedures were performed. Evaluation of the test results along with comparison to other published clay tile data is provided. Volume 1 of this document contains a description of the testing, a summary of the results, comparison to other published clay tile data, and conclusion drawn from the results. Volume 2 contains the unreduced test data, data reduction software, and quality assurance aspects of the testing.

1126 (Y/EN–4595) **Test procedure for prism compression testing of laboratory built prisms: Hollow clay tile wall testing**

program. Fricke, K.E.; Butala, M.B. Oak Ridge Y-12 Plant, TN (United States). Apr 1992. 13p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OS21400. (HCTP–04L). Order Number DE92041223. Source: OSTI; NTIS; GPO Dep.

This procedure describes the fabrication and testing of hollow clay tile (HCT) prisms under laboratory conditions. Objective of the HCT prism compression tests is to determine the compressive strength, Modulus of Elasticity, and Poissons's ratio of the HCT walls as they exist in the Y-12 plant walls. Load versus displacement behavior, including the maximum load and post-peak deformation characteristics will be obtained. The prism test is the standard test used to determine values for f'_m (specified compressive strength at 28 days) which are then used to obtain Code design allowable values. Reason for using laboratory built prisms is that it is a cumbersome process to remove prism specimens from existing walls, transport them to the test site, and then load them into a testing fixture. The wall prisms would be quite fragile as they come out of the walls, and thus the use of laboratory built prisms will permit the testing of more specimens under better controlled conditions.

1128 (BARC–1992/E/003) **Laser based analytical spectroscopy of uranium.** Argekar, A.A. (Bhabha Atomic Research Centre, Bombay (India). Radiochemistry Div.); Kulkarni, M.J.; Godbole, S.V.; Page, A.G.; Samuel, J.K.; Paranjape, D.B.; Singh Mudher, K.D. Bhabha Atomic Research Centre, Bombay (India). 1992. 25p. Order Number DE93605122. Source: OSTI; NTIS (US Sales Only); INIS.

Analytical spectroscopy of uranium has been studied using a XeCl excimer laser, using the fluorescence emission of U(VI) ions doped in a solid solution of sodium fluoride (NaF) and sodium chloride (NaCl) in 3:2 proportion. An electronic circuitry involving time-gating of the photomultiplier tube and facility to integrate the analytical signal over ten laser pulses has been developed to enable laser operation and signal detection with high S/N ratio. The matrix enhanced U(VI) fluorescence emission is free from chemical and spectral interferences due to the concomitant presence of ten metallic elements generally associated with uranium. The digital signal output is highly precise and does not saturate upto 5 ppm uranium concentration. X-ray diffraction patterns obtained for uranium doped compounds at 2.5% and 10% dopant concentrations are broadly similar to that of $Na_2U_2O_7$. The detailed studies have, however, revealed fine structure for individual peaks, thereby, revealing the formation of sodium fluoro-uranate complex which is responsible for the enhanced intensity of fluorescence emission. (author). 10 refs., 6 figs., 2 tabs.

1129 (DOE/ER/13572–1) **The effect of electric fields upon liquid extraction: Progress report.** Carleson, T.E. Idaho Univ., Moscow, ID (United States). Dept. of Chemical Engineering. 13 Apr 1988. 26p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG07-86ER13572. Order Number DE92040894. Source: OSTI; NTIS; GPO Dep.

A series of mass transfer studies were conducted for the extraction of solute from droplets falling in an electric field. The experiments were planned such that the dispersed phase resistance was controlling. In one series of experiments single drops were formed from a charged nozzle and allowed to fall through a continuous, dielectric phase. The drop size and velocity were correlated by means of a simple force balance. Drop mass transfer coefficients were calculated for the drop free fall period and were compared to predictions based upon literature correlations for an oscillating droplet in-the absence of an electric field. Droplet size and velocity were approximately predicted by a staple force balance whereas the mass transfer coefficient was approximately 25–250% higher than that predicted. Droplet extraction efficiencies increased about 20–30% in the presence of electric fields up to 2 kv/cm. For the same field, the drop diameter decreased 30–50% and the terminal velocity increased by up to 50%. The enhancements for the toluene-water system can be ascribed to increases in terminal velocity and decreases in drop diameter. The mass transfer model for freely falling drops proposed by Skelland and Wellek roughly predicts the moderate mass transfer efficiency increases (about 18% at 1 kv/cm) for the toluene water system but failed to predict the increases (about 25% at 0.5 kv/cm) for the heptane furfural system. The second series of experiments involved the formation of a swarm of droplets in a three stage sieve tray column. In a separate series of experiments. the effect of the electric field upon mass transfer from drops exhibiting interfacial turbulence was evaluated.

1130 (DOE/ER/13572–4) **Drop oscillation and mass transfer in alternating electric fields: Progress report.** Carleson, T.E.; Yang, W. Idaho Univ., Moscow, ID (United States). Dept. of Chemical Engineering. 30 May 1991. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG07-86ER13572. Order Number DE92040897. Source: OSTI; NTIS; GPO Dep.

After the second annual progress report to DOE in July 1990, we continued the experimental work for another liquid system. The mathematical model was also improved to include secondary effects due to drop deformation and charge redistribution on the deformed drop surface. Originally, we planned to study a mass transfer process after the hydrodynamic modelling. Due to difficulty in measuring drop concentration during oscillations, we decided to study a heat transfer process instead. Using the analogy between the mass transfer and the heat transfer, we can easily extend the results for the heat transfer study to the mass transfer problem.

1131 (DOE/ER/13613–36) **Capillary liquid chromatography using laser-based and mass spectrometric detection: Final technical progress report, September 1, 1989–January 31, 1993.** Sepaniak, M.J.; Cook, K.D. Tennessee Univ., Knoxville, TN (United States). Dept. of Chemistry. [1992]. 15p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG05-86ER13613. Order Number DE92040524. Source: OSTI; NTIS; GPO Dep.

In the years following the 1986 seminal paper (J. Chromatogr. Sci., 24, 347-352) describing modern capillary zone electrophoresis (CZE), the prominence of capillary electrokinetic separation techniques has grown. A related electrochromatographic technique is micellar electrokinetic capillary chromatography (MECC). This report presents a brief synopsis of research efforts during the current 3-year period. In addition to a description of analytical separations-based research, results of efforts to develop and expand spectrometric detection for the techniques is reviewed. Laser fluorometric detection schemes have been successfully advanced. Mass spectrometric research was less fruitful, largely owing to personnel limitations. A regenerable fiber optic sensor was developed that can be used to remotely monitor chemical carcinogens, etc. (DLC)

1132 (DOE/ER/13659–6) **New high temperature plasmas and sample introduction systems for analytical atomic emission and mass spectrometry: Progress report, January 1, 1990–December 31, 1992.** Montaser, A. George Washington

Univ., Washington, DC (United States). Office of Sponsored Research. [1992]. 40p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG05-87ER13659. Order Number DE92040602. Source: OSTI; NTIS; GPO Dep.

New high temperature plasmas and new sample introduction systems are explored for rapid elemental and isotopic analysis of gases, solutions, and solids using mass spectrometry and atomic emission spectrometry. Emphasis was placed on atmospheric pressure He inductively coupled plasmas (ICP) suitable for atomization, excitation, and ionization of elements; simulation and computer modeling of plasma sources with potential for use in spectrochemical analysis; spectroscopic imaging and diagnostic studies of high temperature plasmas, particularly He ICP discharges; and development of new, low-cost sample introduction systems, and examination of techniques for probing the aerosols over a wide range. Refs., 14 figs. (DLC)

1133 (DPW–5331) **Ion exchange coupling - activity experiments.** Watt, G.W. Du Pont de Nemours (E.I.) and Co., Wilmington, DE (United States). Explosives Dept. 7 May 1952. 2p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-76SR00001. (SR/H–215). Order Number DE93001242. Source: OSTI; NTIS (US Sales Only); GPO Dep.

This report discusses the buildup of zirconium on Dowex 50 resin columns of the type anticipated for use at Savannah River Plant. This report is dated May 7, 1952. (JL)

1134 (FRCEA-TH–369) **Application of crown ethers to selective extraction and quantitative analysis of technetium 99, iodine 129 and cesium 135 in effluents.** Paviet, P. CEA Centre d'Etudes de Cadarache, 13 - Saint-Paul-lez-Durance (France). Dept. Stockage Dechets; Paris-11 Univ., 91 - Orsay (France). 23 Jun 1992. 210p. (In French). Order Number DE93721139. Source: OSTI; NTIS (US Sales Only); INIS.

Properties of crown ethers are first recalled. Then extraction of technetium 99 is studied in actual radioactive effluents. Quantitative analysis is carried out by liquid scintillation and interference of tritium is corrected. Iodine 129 is extracted from radioactive effluents and determined by gamma spectrometry. Finally cesium 135 is extracted and determined by thermo ionization mass spectroscopy.

1138 (IS-T–1630) **Novel detection schemes and automated image analysis algorithms for planar chromatography and gel electrophoresis.** Koutney, L.B. Ames Lab., IA (United States). 9 Sep 1992. 211p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-82. Order Number DE93001219. Source: OSTI; NTIS; GPO Dep.

After a discussion of charge coupled devices and personal computer capabilities, examples of their applications involving novel analytical techniques are presented: laser-based indirect fluorometric detection in thin-layer chromatography; on-line detection of DNA and proteins in gel electrophoresis by uv absorption; automated image analysis for distortion compensation in sequencing gel electrophoresis; and expert systems for data acquisition to achieve constant signal-to-noise, with application to DNA sequencing slab gels.

1139 (KAERI/RR–999/91) **Development of laser technology: Development of laser atomic spectroscopic technology.** Lee, Jong Min (Korea Atomic Energy Research Inst., Daeduk (Korea, Republic of)); Cha, Hyung Ki; Yoo, Byung Duk. Korea Atomic Energy Research Inst., Daeduk (Korea, Republic of). Jul 1991. 186p. (In Korean). Order Number DE93605123. Source: OSTI; NTIS (US Sales Only); INIS.

The goal of the project is to develop an efficient detection method of heavy metal elements of trace amount. In this year, a Nd:YAG laser and a dye laser were designed and constructed. Also a high vacuum chamber and TOF mass spectrometer for ion analysis were made. With these equipment, photoionization experiments and elemental analyses were performed for Pb and Cd. This study is thought to provide technological resolution for severe social problems arising from the harmful pollution due to heavy metal elements, and for the analysis of atomic elements utilized in the nuclear industries. (Author).

1140 (KCP–613-4841) **Peristaltic pumps for waste disposal.** Griffith, G.W. Allied-Signal Aerospace Co., Kansas City, MO (United States). Kansas City Div. Sep 1992. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00613. (CONF-9210172–1: ISLAR '92: international symposium on laboratory automation and robotics, Boston, MA (United States), 25-28 Oct 1992). Order Number DE93000399. Source: OSTI; NTIS; INIS; GPO Dep.

Laboratory robots are capable of generating large volumes of hazardous liquid wastes when they are used to perform chemical analyses of metal finishing solutions. A robot at Allied-Signal Inc., Kansas City Division, generates 30 gallons of acid waste each month. This waste contains mineral acids, heavy metals, metal fluorides, and other materials. The waste must be contained in special drums that are closed to the atmosphere. The initial disposal method was to have the robot pour the waste into a collecting funnel, which contained a liquid-sensing valve to admit the waste into the drum. Spills were inevitable, splashing occurred, and the special valve often didn't work well. The device also occupied a large amount of premium bench space. Peristaltic pumps are made to handle hazardous liquids quickly and efficiently. A variable-speed pump, equipped with a quick-loading pump head, was mounted below the robot bench near the waste barrel. The pump inlet tube was mounted above the bench within easy reach of the robot, while the outlet tube was connected directly to the barrel. During operation, the robot brings the waste liquid up to the pump inlet tube and activates the pump. When the waste has been removed, the pump stops. The procedure is quick, simple, inexpensive, safe, and reliable.

1141 (LBL–32430) **Separation of compounds with multiple -OH groups from dilute aqueous solutions via complexation with organoboronate.** Chow, Tina Kuo Fung. Lawrence Berkeley Lab., CA (United States). May 1992. 80p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00098. Order Number DE92041201. Source: OSTI; NTIS; GPO Dep.

The complexing extractant agent investigated in this work is 3-nitrophenylboronic acid (NPBA) in its anionic form (NPB). NPBA and Aliquat 336 (quaternary amine) is dissolved in 2-ethyl-l-hexanol, and the extractant is contacted with aq. NaOH. Solutes investigated were 1,2-propanediol, glycerol, fructose, sorbitol and lactic acid. Batch extraction experiments were performed at 25°C. Partition coefficients, distribution ratios and loadings are reported for varying concentrations of solute and NPB. All solutes complexed with NPB^-, with all complexes containing only one NPB^- per complex. The 1:1 complexation constants for the solutes glycerol, fructose and sorbitol follow trends similar to complexation with $B(OH)_4^-$ (aq.), i.e. the complexation constants increase with increasing number of –OH groups available for complexation. Assumption of 1:1 complex is not valid for 1, 2-propanediol, which showed overloading (more than one mole of solute complexed to one mole NPB^-) at higher concentrations. The –OH group on the NPB^- which is left uncomplexed after one solute molecule had bound to the other two –OH groups may be responsible for the overloading. Overloading is also observed in extraction of tactic acid, but through a different mechanism. It was found that $TOMA^+$ can extract lactic acid to an extent comparable to the uptake of lactic acid by NPB^-. The complexation is probably through formation of an acid-base ion pair. Losses of NPBA into the aqueous phase could lead to problems, poor economics in industrial separation processes. One way of overcoming this problem would be to incorporate the NPBA onto a solid support.

1142 (PCCF-RI–92-01) **Study by neutron activation analysis and by X-ray diffraction of ossification kinetics of coral implanted in pig cortex.** Irigaray, J.L.; Oudadesse, H.; Sauvage, T. Clermont-Ferrand-2 Univ., 63 - Aubiere (France). Lab. de Physique Corpusculaire. 1992. 37p. (In French). Order Number DE93721055. Source: OSTI; NTIS (US Sales Only); INIS.

Inorganic chemical composition of coral implanted in vivo is studied by neutron activation. Ca, P, Sr and Mg are determined for various implantation time (1 to 24 weeks), after a latent period of one week calcium content of coral increase up to 6 weeks to attain mean content of bones, phosphorus content increase up to 12 weeks, strontium decrease rapidly and magnesium decrease slightly during the first week and increase up to 10 weeks. Then crystal structure of coral after implantation is studied by X-ray diffraction.

1143 (PCCF-T–91-03) **Thermoluminescence dating. Application to the chronology of volcanic ashes.** Pilleyre, T. Clermont-Ferrand-2 Univ., 63 - Aubiere (France). Lab. de Physique Corpusculaire. Sep 1991. 164p. (In French). Order Number DE93721054. Source: OSTI; NTIS (US Sales Only); INIS.

Thermoluminescent (TL) dating is generally used for minerals heated in the past and can be used for absolute chronology of volcanic ashes but seems limited to less than 15.000 years. The aim of the thesis is the study of thermoluminescent properties of quartz for high doses and long irradiations using the red TL peak of quartz which is situated at high temperature (about 370 deg. C) to extend the method for higher ages. A theory, based on spatial correlation between electron and hole created during the same ionization, is developed. A chapter is devoted to dosimetry because of its importance in TL dating, especially alpha scintillation counting and the influence of humidity on the determination of annual dose. Volcanic samples are dated from 10.000 to 80.000 years before present.

1144 (SER/CDM–28) **Coulometric determination of uranium using platinum and mercury electrodes.** Chegrouche, Salah (Centre de Developpement des Materiaux, Algiers (Algeria). Labo. d'Analyse); Mousty, Francis. Secretariat d'Etat a la Recherche, Algiers (Algeria). Jul 1992. 19p. (In French). Order Number DE93605124. Source: OSTI; NTIS (US Sales Only); INIS.

The present paper describes the uranium controlled potential coulometric titration technique in sulfuric acid media using two different electrodes: the mercury and the platinum electrode. The platinum electrode presents several important practical advantages compared to that of mercury. Using the platinum electrode, the uranium coulometric oxidation from state IV to VI is feasible and the couples of iron (III) and uranium (IV) or plutonium (IV) and uranium (IV) determination can be realised with the same electrode and the same solution the uranium and iron or plutonium quantity which reacted is calculated using coulombs number necessary to obtain either the total oxidation or reduction of the elements of interest.

1145 (AECL–10374) **Modelling electric discharge chemistry.** McFarlane, J.; Wren, J.C. Atomic Energy of Canada Ltd., Pinawa, MB (Canada). Whiteshell Nuclear Research Establishment. Jul 1991. 100p. Order Number DE93603766. Source: OSTI; NTIS (US Sales Only); INIS.

The chemistry occurring in a electric discharge was modelled to predict how it would be influenced by discharge conditions. The discharge was characterized by a calculated Boltzmann electron-energy distribution, from which rate constants for electron-molecule processes in air were determined. These rate constants were used in a chemical kinetics calculation that also included reactions between neutral molecules, ions, free radicals and electronically excited species. The model describes how the discharge chemistry was influenced by humidity, electric field, electron number density, and concentrations of key reagents identified in the study. The use of an electric discharge to destroy airborne contaminant molecules was appraised, the targeted contaminants being CF_2Cl_2, HCN, and SO_2. The modelling results indicate that an electric discharge should be able to remove HCN and CF_2Cl_2 effectively, especially if the discharge conditions have been optimized. Effective destruction is achieved with a moderate electric field (over 1×10^{-15} $V.cm^2$), a substantial electron number density (over 1×10^{12} cm^{-3}), and the presence of H_20 in the process air. The residence time in the discharge was also shown to be important in contaminant destruction. An attempt was made to explain the results of the electric discharge abatement of SO_2, a component of a simulated flue-gas mixture. Results from the model indicate that the discharge parameters that increase the concentration of hydroxyl radical also increase the rate of decomposition of SO_2. An objective of the study was to explain the apparent enhancement of SO_2 destruction by the presence of a small amount of NO_2. It was thought that a likely explanation would be the stabilization of $HOSO_2$, an important intermediate in the oxidation of SO_2 by NO_2. (49 figs., 14 tabs., 75 refs.).

1146 (AECL–10402) **The cathodic reduction of dioxygen on uranium oxide in dilute alkaline aqueous solution.** Hocking, W.H.; Betteridge, J.S.; Shoesmith, D.W. Atomic Energy of Canada Ltd., Pinawa, MB (Canada). Whiteshell Nuclear Research Establishment. Sep 1991. 142p. Order Number DE93603176. Source: OSTI; NTIS (US Sales Only); INIS.

The cathodic reduction of dioxygen on uranium oxide in dilute alkaline aqueous solutions has been investigated within the context of a program to develop a comprehensive model to predict the behaviour of used CANDU (Canada Deuterium Uranium) nuclear fuel under disposal-vault conditions. Two different kinds of ceramic UO_2 were studied: reactor-grade CANDU fuel with normal p-type electrical conductivity and low-resistance material that exhibits n-type photoelectrochemical behaviour. The transport of electroactive species in solution was controlled by varying the rotation rate of rotating disc electrodes (RDE) and rotating ring-disc electrodes (RRDE). Steady-state polarization measurements were made using the current-interrupt method to compensate for the potential drop caused by ohmic resistance. Any release of peroxide to solution from the UO_2 (disc) surface could be monitored by oxidizing it at the Au ring of an RRDE. The existing theory for the cathodic 0_2-reduction process as applied to RDE and RRDE experiments has been reviewed as a starting point for the interpretation of the results obtained in our work. (37 figs., 2 tabs., 170 refs.).

1147 (ANL/CP–76412) **Kinetic studies of reactions of cobalt clusters with deuterium.** Ho, J.; Zhu, L.; Parks, E.K.; Riley, S.J. Argonne National Lab., IL (United States). [1992]. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-920921–4: 6. international symposium on small particles and inorganic clusters, Chicago, IL (United States), 16-22 Sep 1992). Order Number DE93000514. Source: OSTI; NTIS; GPO Dep.

The kinetics of chemical reactions of cobalt clusters Co_n with deuterium are described. Absolute rate constants have been measured in the cluster range n = 7–68 at 293 K. The rate constants are found to be a strong function of cluster size, varying by up to three orders of magnitude. This size , dependence is most prominent in the n = 7–25 size range: CO_{15} is the most reactive cluster, and CO_{7-9} and CO_{19--20} are particularly unreactive. Abrupt changes in the rate constants from one cluster size to the next are observed. For the clusters above n = 25, the rate constants show several less prominent maxima and minima superimposed on a slow, nearly monotonic increase with cluster size.

1148 (BARC–1992/E/007) **The synthesis and characterisation of some aliphatic monoamides and diamides.** Ruikar, P.B. (Bhabha Atomic Research Centre, Bombay (India). Radiochemistry Div.); Prabhu, D.R.; Mahajan, G.R.; Nagar, M.S.; Nair, G.M.; Subramanian, M.S. Bhabha Atomic Research Centre, Bombay (India). 1992. 12p. Order Number DE93605138. Source: OSTI; NTIS (US Sales Only); INIS.

This report summarises the synthesis and characterisation of several symmetrical, unsymmetrical and branched chain amides which have potential application as alternate extractants to TBP in the Purex Process. Some substituted diamides which have importance in the removal of actinides from transuranium waste have also been synthesised and characterised. The amides contents determined by nonaqueous potentiometric titration indicate a purity of 97-100%. The relative basicity of these amides and diamides have been determined by measuring the equilibrium constants for the uptake of nitric acid by them. The streching frequency of their carbonyl bond has also been listed. (author). 26 refs., 3 tabs.

1149 (CONF-9206274–2) **Cavity-enhanced spontaneous emission rates for rhodamine 6-G in levitated microdroplets.** Barnes, M.D. (Oak Ridge National Lab., TN (United States)); Whitten, W.B.; Ramsey, J.M.; Arnold, S. Oak Ridge National Lab., TN (United States). [1992]. 16p. Sponsored by USDOE, Washington, DC (United States); National Science Foundation, Washington, DC (United States). Grant ATM-89-175871. From US Army Chemical Research Development Engineering Center (CRDEC) conference on obscuration and aerosol research; Aberdeen Proving Grounds, MD (United States); 22-26 Jun 1992. Order Number DE93000439. Source: OSTI; NTIS; INIS; GPO Dep.

Fluorescence decay kinetics of Rhodamine 6-G molecules in levitated glycerol microdroplets (4–20 microns in diameter) have been investigated to determine the effects of spherical cavity resonances on spontaneous emission rates. For droplet diameters greater than 10 microns, the fluorescence lifetime is essentially the same as in bulk glycerol. As the droplet diameter is decreased below 10 microns, bi-exponential decay behavior is observed with a slow component whose rate is similar to bulk glycerol, and a fast component whose rate is as much as a factor of 10 larger than the bulk decay rate. This fast component is attributed to cavity enhancement of the spontaneous emission rate and, within the weak coupling approximation, a value for the homogeneous linewidth at room temperature can be estimated from the fluorescence lifetime data.

1150 (CONF-9210161–3) **Resonance electron scattering by adsorbed molecules: σ^* resonance energy versus bond length.** Siller, L. (Cambridge Univ. (United Kingdom). Cavendish Lab.); Hock, K.M.; Palmer, R.E.; Wendelken, J.F. Oak Ridge National Lab., TN (United States). [1992]. 13p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From 12. international vacuum congress; Hague (Netherlands); 12-16 Oct 1992. Order Number DE93000445. Source: OSTI; NTIS; GPO Dep.

The paper explores the relationship between the energy of the σ^* negative ion resonance, observed in the cross-section for vibrational excitation of small molecules in electron energy loss spectroscopy (EELS), and the intramolecular bond length. On the basis of experimental results assembled from studies of electron scattering by both fire and adsorbed molecules containing the C-0 group, we find an approximately linear empirical correlation between the resonance energy and the C-0 bond length. This correlation is accurately reproduced by multiple scattering $X\alpha$ calculations for the free CO molecule as a function of bond length, suggesting the possible determination of molecular bond lengths from the σ^* resonance energies obtained in EELS. Similar calculations are reported for N_2 and 0_2 in addition to CO.

1151 (DOE/CE/23810–3A) **Thermophysical properties: Quarterly report, 1 April 1992–30 June 1992.** Kayser, R.F. National Inst. of Standards and Technology (IMSE), Gaithersburg, MD (United States). Jul 1992. 52p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-91CE23810. Order Number DE93000493. Source: OSTI; NTIS; GPO Dep.

Numerous fluids have been identified as promising alternative refrigerants, but much of the information needed to predict their behavior as pure fluids and as components in mixtures does not exist. In particular, reliable thermophysical properties data and models are needed to predict the performance of the new refrigerants in heating and cooling equipment, and to design and optimize equipment to be reliable and energy efficient. The objective of this project is to provide highly accurate, selected thermophysical properties data for Refrigerants 32, 123, 124, and 125, and to use these data to fit simple and complex equations of state and detailed transport property models. The new data will fill gaps in the existing data sets and resolve the problems and uncertainties that exist in and between the data sets. This report describes the progress made during the second quarter of this fifteen-month project, which was initiated in late January, 1992.

1152 (DOE/ER/13290–8) **Chemistry of oxygenates on transition metal surfaces: Activation of C- H, C-C, and C-O bonds: Progress report, December 15, 1991.** Delaware Univ., Newark, DE (United States). [1991]. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-84ER13290. Order Number DE92040843. Source: OSTI; NTIS; GPO Dep.

Goal is to understand the requirements for and competition between activation of C-H, C-C, and C-O bonds in the synthesis and decomposition of oxygenates on transition metal surfaces. Efforts during the past year was devoted primarily to the role of activation of β-CH bonds in decarbonylation of higher oxygenates on surfaces of metals such as Rh and Pd; studies were completed of more than a dozen C_1-C_3 oxygenates on Rh(111), and progress was made with reagents for which β-CH scission is blocked. It is shown that alcohols and aldehydes do not react via a common pathway on on Rh(111). Ethanol and acetaldehyde are formed from CO + H_2 by parallel routes on Rh catalysts which do not contain interacting supports or oxide promoters; i.e., the two compounds result from CO insertion into different metal-hydrocarbon bonds. Aldehydes decarbonylate via α-CH scission to form acyl, followed by C-C scission to release an alkyl ligand; this ligand undergoes hydrogenation and dehydrogenation steps. Alcohols form surface alkoxides, but these do not dehydrogenate further to the aldehydes, they release CO + H_2 but no volatile hydrocarbon. These results indicate that β-CH scissors to form a surface oxametallacycle intermediate; supporting evidence is spresented for this intermediate. Chemistry of alcohols blocked to different extends at the β-position was also studied; complete blocking (CF_3CH_2OH) forces the reaction to follow the aldehyde-acyl path, while partial substitution at the β position (branched alcohols) favors the oxametallacycle pathway. (DLC)

1153 (DOE/ER/13463–9) **Novel macrocyclic carriers for proton-coupled liquid membrane transport: Progress report, December 1, 1991–November 30, 1992.** Lamb, J.D.; Bradshaw, J.S.; Izatt, R.M. Brigham Young Univ., Provo, UT (United States). Dept. of Chemistry. Jul 1992. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-86ER13463. Order Number DE93003160. Source: OSTI; NTIS; GPO Dep.

A number of new macrocyclic ligands was prepared for transport studies. The cryptands were prpepared (18-40% yield) by a new metal carbonate-catalyzed one-step method from 1 mole

oligoethyleneoxy diamine and 2 moles diahlide derivative of oligoethylene glycol. Bis-crown ethers were also isolated in 17-30% yields. Cage compounds were also prepared; they interact with various metal ions and protons. Back extraction and dual module hollow fiber membrane separation experiments were used to study the cation selectivity of new ligands, including crown thioethers. An isothermal flow calorimeter is being constructed for studies of macrocycle-cation reactions. 3 figs, 2 tabs.

1154 (DOE/ER/13626–6) **Morphological aspects of surface reactions: Progress report, September 1991–August 1992.** White, J.M. Texas Univ., Austin, TX (United States). Dept. of Chemistry. Aug 1992. 23p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG05-86ER13626. Order Number DE92040522. Source: OSTI; NTIS; GPO Dep.

This program involves the preparation and characterization (both structural and kinetic) of metal-based catalysts and adsorbates thereon. The substrates involve mainly Rh and Ag; oxides of Si, Al and Ti are used for supports for particles and thin metal films. Adsorbates include carbon oxides, halogenated hydrocarbons, benzene and alkalis. Particular attention is given to synthesis of hydrocarbon fragments by photochemical and electron-induced methods. Tunneling microscopy and spectroscopy are used to study the morphology and electronic structure of the metals. (DLC)

1155 (DOE/ER/13943–02) **Theoretical and experimental study of mixed solvent electrolytes: Final report, July 1, 1988–December 31, 1991.** Cummings, P.T.; O'Connell, J.P. Virginia Univ., Charlottesville, VA (United States). Dept. of Chemical Engineering. Jul 1991. 25p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG05-88ER13943. (UVA–527381/CHE91/102). Order Number DE93001847. Source: OSTI; NTIS; GPO Dep.

The goals of the research program have evolved into the following: Molecular simulation of phase equilibria in aqueous and mixed solvent electrolyte solutions; molecular simulation of solvation and structure in supercritical aqueous systems; extension of experimental database on mixed solvent electrolytes; analysis of the thermodynamic properties of mixed solvent electrolyte solutions and mixed electrolyte solutions using fiuctuation solution theory; development of analytic expressions for thermodynamic properties of mixed solvent electrolyte solutions using analytically solved integral equation approximations; and fundamental modeling of mixed solvent electrolytes using numerically solved integral equation approximation theories. We report and evaluate our progress during the period of the grant in light of these six goals in detail in this paper.

1156 (DOE/ER/14080–3) **Development of an experimental data base and theories for prediction of thermodynamic properties of aqueous electrolytes and nonelectrolytes of geochemical significance at supercritical temperatures and pressures: Annual performance report.** Wood, R.H. (Delaware Univ., Newark, DE (United States). Dept. of Chemistry and Biochemistry); Hnedkovsky, L.; Lin, Ching Lung; Shock, E.L. Delaware Univ., Newark, DE (United States). Dept. of Chemistry and Biochemistry. 24 Feb 1992. 20p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-89ER14080. Order Number DE92040856. Source: OSTI; NTIS; GPO Dep.

This project is divided into method experimental measurements, theoretical development, and geochemical applications. We have completed experimental volumetric measurements on aqueous solutions of CO_2 H_2S, CH_4, NH_3 and $B(OH)_3$ at 25 to 432°C and 280 and 350 bar. A vibrating tube densitometer that allows density measurements near bubble point and also measures the bubble pressure was developed and used to measure densities and bubble pressures of aqueous Co_2. Heat capacity measurements should be completed by the end of the grant period. Simulations of models for methane in water at temperatures to 1000°C are in progress. In order to facilitate these free energy calculations the possible errors associated with the calculations have been explored in two papers (Wood, 1991; Wood et al., 1991) and methods of controlling and estimating these errors have been developed. Applications of the new data to geochemical processes is now possible. Efforts have focussed on extracting equilibrium constants for carbonic acid dissociation at supercritical condition from published experiments on mineral equilibria in H_20-CO_2 fluids (Boehlke and Shock, 1990; and in prep.). As a result, estimates of pKa for carbonic acid are now available at temperatures from 300 to 750°C and pressures from 1 to 7 kilobars. They will be combined with $\bar{V}^\circ$ and $\bar{C}p^\circ$ data for CO^2(aq) to improve geochemical calculations.

1157 (DOE/ER/14161–2) **Spectroscopic investigation of the vibrational quasi-continuum arising from internal rotation of a methyl group: Progress report, September 15, 1991–September 14, 1992.** Hougen, J.T. National Inst. of Standards and Technology, Gaithersburg, MD (United States). Molecular Physics Div. [1992]. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AI05-90ER14161. Order Number DE93001389. Source: OSTI; NTIS; GPO Dep.

Acetaldehyde was studied. The investigation of the ground electronic state has three parts: the internal-rotor manifold, the traditional vibrational manifold, and interactions between internal rotation and ordinary vibrations. Progress is reported for each.

1158 (DOE/ER/45151–T1) **Microscopic physical and chemical properties of graphite intercalation compounds: Final report, August 1, 1984–July 31, 1985.** Eklund, P.C. Kentucky Univ., Lexington, KY (United States). Dept. of Physics and Astronomy. 24 Aug 1992. 59p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG05-84ER45151. Order Number DE93001701. Source: OSTI; NTIS; GPO Dep.

Optical spectroscopy (Raman, FTIR and Reflection) was used to study a variety of acceptor- and donor-type compounds synthesized to determine the microscopic models consistent with the spectrocsopic results. General finding is that the electrical conduction properties of these compounds can be understood on the basis that the intercalation of atomic and/or molecular species between the host graphite layers either raises or lowers the Fermi level (E_{Fi}) in a graphitic band structure. This movement of E_F is accomplished via a charge transfer of electrons from the intercalate layers to the graphitic layers (donor compounds), or vice versa (acceptor compounds). Furthermore, the band structure must be modified to take into account the layers of charge that occur as a result of the charge transfer. This charge layering introduces additional bands of states near E_F, which are discussed. Charge-transfer also induces a perturbation of the graphitic normal mode frequencies which can be understood as the result of a contraction (acceptor compounds) or expansion (donor compounds) of the intralayer C-C bonds. Ab-initio calculations support this view and are in reasonable agreement with experimental data.

1159 (DOE/PC/90292–T6) **Alternative formulations of regenerable flue gas cleanup catalysts: Progress report, December 1, 1991–February 29, 1992.** Mitchell, M.B.; White, M.G. During this quarter, we have investigated the impregnation of a high purity Goodfellow γ-alumina with magnesium acetylacetonate dehydrate [$Mg(acac)_2 \cdot 2H_2O$], and the loading as a function of impregnation solution concentration. We focus on the loading of complex as a function of initial amount of complex in solution and the stoichiometry of the supported metal complex. The goal is to obtain a monolayer film of the metal complex on the support.

1160 (IC–92/198) **Atomic size effects on local coordination and medium range order in molten trivalent metal chlorides.** Tatlipinar, H. (International Centre for Theoretical Physics, Trieste (Italy)); Akdeniz, Z.; Pastore, G.; Tosi, M.P. International Centre for Theoretical Physics, Trieste (Italy). Aug 1992. 25p. Order Number DE93605139. Source: OSTI; NTIS (US Sales Only); INIS.

Structural correlations in molten trivalent metal chlorides are evaluated as functions of the metal ion size R_M across the range from $LaCl_3$ (R_M approx. 1.4 A) to $AlCl_3$ (R_M approx. 0.8 A), using a charged soft-sphere model and the hypernetted chain approximation. Main attention is given to trends in the local liquid structure (partial radial distribution functions, coordination numbers and bond lengths) and in the intermediate range order (first sharp diffraction peak in the number-number and partial structure factors). The

trend towards fourfold local coordination of the metal ions, the stabilization of their first-neighbour chlorine cage and the growth of medium range order are found to proceed in parallel as the size of the metal ion is allowed to decrease at constant number density and temperature. A tendency to molecular-type local structure and liquid-vapour phase separation is found within the hypernetted chain scheme at small metal ion sizes corresponding to $AlCl_3$ and is emphasized by decreasing the number density of the fluid. The predicted molecular units are rather strongly distorted Al_2Cl_6 dimers, in agreement with observation. The calculated structural trends for other trichlorides are compared with diffraction and transport data. (author). 17 refs, 8 figs, 1 tab.

Thesis submitted to Iowa State University.

This work describes the theoretical analysis, experimental development, and application of an in situ spectroelectrochemical cell for measuring infrared reflection-absorption spectra (IRRAS) of monolayer-coated Au surfaces beneath a thin aqueous overlayer. The cell allows the interchange of sample and reference substrates, thereby facilitating IRRAS of long-chain alkanethiolates in the C-H stretching region without electrochemical or polarization-modulation methods. The same in situ cell is combined with electrochemical modulation to study monolayers self-assembled from 11-mercaptoundecyl ferrocenecarboxylate ($FcCOOC_{11}SH$) at gold and to correlate the monolayer structure and composition with the ferrocenyl redox chemistry. An electrochemically active monolayer of an alkanethiolate derivatized with a flavin, formed by self-assembly from ethanolic solutions of 11,11'-dithiobisundecanoic acid, bis[2-(7,8-dimethyl-10-isoalloxazino)ethyl] ester, is described. IRRAS of the film, which is a candidate for future in situ spectroscopic studies, are presented and compared with transmission spectra of bulk analogs.

1169 (IS-T–1620) **Distance analysis of Patterson calculations and molecular mechanics as aids in structure solution.** Day, C.L. Ames Lab., IA (United States). 9 Sep 1992. 142p. Two methods (SUPSYMM and MMXRAY) for crystal structures insoluble through normal crystallography have been developed. SUPSYMM needs only a list of Patterson superposition peaks as its starting point. Using distance analysis and vector projections, symmetry relations between the superposition peaks are identified

which are exploited to identify probable peak positions for least-squares refinement. MMXRAY solves large organometallic structures by using Patterson superposition and molecular mechanics. Patterson superposition techniques can usually locate at least the heavy atoms. Molecular mechanics is used to model the remaining organic parts of the structure. MMXRAY converts the modeled structure to the original crystallographic reference system. Two programs designed to teach the basics of both powder and single crystal X-ray diffraction methods to undergraduate physical chemistry students are presented in the Appendix. Several crystal structures solved through routine crystallographic routes are also discussed.

1170 (KAERI/RR–1073/91) **A study on the separation characteristics of tritiated water vapor adsorption-II.** Sung, Ki Woung (Korea Atomic Energy Research Inst., Daeduk (Korea, Republic of)); Kim, Yong Eak; Na, Jung Won; Kim, Kwang Rak; Ahn, Do Hee; Chung, Hoong Suck; Cho, Young Hyun; Park, Soong Woo; Kim, In Won. In order to meet a small tritiated heavy water leakage in the heavy water nuclear reactor building, it is required to increase the sorption efficiency of adsorbent and sorption performance of the present heavy water vapor recovery system. Accordingly, the equilibrium charcteristics of sorption of zeolite molecular sieve 13X and 4A were investigated, and the 4A was confirmed as a substitute of 13X. Furthermore, the pressure swing sorption mechanism was confirmed as a higher efficient substitute of the present temperature swing process, and the detailed design, operational condition and the detailed manufacturing method of it was suggested. (Author).

1171 (LBL–31675) **Investigations of hydrodenitrogenation of quinoline over molydenum nitride.** Lee, K.S.; Reimer, J.A.; Bell, A.T. Lawrence Berkeley Lab., CA (United States). Dec 1991. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00098. (CONF-920701–2: 10. international congress on catalysis, Budapest (Hungary), 19-24 Jul 1992). Order Number DE93000571. Source: OSTI; NTIS; GPO Dep.

An investigation has been carried out of the reaction pathway for the hydrodenitrogenation of quinoline over Mo_2N. Quinoline is found to undergo a rapid hydrogenation to form 1,2,3,4,-tetrahydroquinoline. This product then reacts more slowly to form 2-propylanaline, which in turn undergoes hydrogenolysis of the C-N bond in the saturated ring to form propylbenzene. No evidence is found for propylcyclohexane.

1172 (LBL–32408, pp. 259-262) **Analysis of forward and inverse problems in chemical dynamics and spectroscopy.** Rabitz, H. (Princeton Univ., NJ (United States)). Lawrence Berkeley Lab., CA (United States). [1992]. (CONF-9206180–Summs.: 14. combustion research meeting, Tahoe City, CA (United States), 14-17 Jun 1992). In *Fourteenth combustion research conference.* 347p. Order Number DE92017086. Source: OSTI; NTIS.

The goal of this research is to provide a better understanding of the relationship between structure in potential surfaces, and the behavior of resultant dynamical observables. This problem is being pursued from both the forward and inverse perspectives. In the case of forward analysis, one starts with a potential surface and proceeds to compute dynamical observables. In this case, the objective is to discern those parts of the potential surface that control significant dynamical events. In the case of inversion, the objective is to ultimately provide an algorithm for the stable inversion of quality laboratory data, to yield the underlying fundamental potential surfaces. The forward and inverse problems are intimately related, physically as well as operationally, though their common use of functional sensitivity analysis to map the forward and inverse observable $\Leftrightarrow$ potential relationships. The collinear $H + H_2$ exchange reaction was studied to explore how sensitivity information from one potential surface may be used to predict observables from a second surface. A detailed study of this type of this type was carried out for the laminar $CO\text{-}H_2\text{-}O_2$ flame under steady state conditions. The reactions of the hydroperoxy radical with hydrogen, oxygen, and hydroxy radicals were found to be extremely important at all temperatures in the fuel lean (40 torr) flame studied. A simulation of the full three-dimensional inversion for the He-Xe/C(0001) system was studied. Here, helium is being scattered from a xenon overlayer on graphite. The simulated inversion of ground state H_2 vibration-rotation spectral data was undertaken. The potential was recovered to high accuracy.

1173 (LBL–32473) **Spectroscopic and magnetic studies of tetravalent Pa and trivalent Th compounds.** Edelstein, N.M.; Kot, W.K. Lawrence Berkeley Lab., CA (United States). Jun 1992. 22p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00098. (CONF-920625–6: Conference on rare earths, Kyoto (Japan), 1-5 Jun 1992). Order Number DE92041214. Source: OSTI; NTIS; INIS; GPO Dep.

At the beginning of the actinide series, the 5f and 6d configurations are very close in energy. Consequently, both the 5f and 6d energy level splittings may be observed experimentally in Pa^{4+} and Th^{3+} compounds. The available magnetic and optical data on these systems are reviewed.

1174 (PNL-SA–21261) **Interactions between manganese oxides and multiple-ringed aromatic compounds.** Whelan, G. (Pacific Northwest Lab., Richland, WA (United States)); Sims, R.C. Pacific Northwest Lab., Richland, WA (United States). Aug 1992. 33p. Sponsored by USDOE, Washington, DC (United States); Geological Survey, Reston, VA (United States). DOE Contract AC06-76RL01830. Grant 14-08-0001-G1723. (CONF-9208152–1: ISSS working group meeting, Edmonton (Canada), 10-16 Aug 1992). Order Number DE92041342. Source: OSTI; NTIS; INIS; GPO Dep.

Objective is to determine whether Mn reductive dissolution can oxidize multiple-ringed aromatics, such as PAHs, in an oxic environment? Research indicated that certain PAHs (eg, dihydrodiols and diones that form free-radical intermediates) are susceptible to oxidation and polymerization. Over 14 days, 83, 76, 54, 70, and 20% of the Mn was reduced by 2,3-, 1,3-, and 1,4-naphthalenediol, quinizarin, and 1,4-naphthoquinone, respectively. 100, 100, and 65% of the first three PAHs were oxidized, respectively. Aromatics with diol functional groups were more easily oxidized than those with only dione groups. Relatively insoluble compounds like quinizarin can be oxidized; insoluble "humic-like" material precipitated, indicating a polymerization-humification process. Results suggest that electron transfer/organic release from the oxide surface is the rate-limiting step.

1175 (SAND–92-8623) **A theoretical study of the thermochemistry of molecules in the Si-C-Cl-H system.** Allendorf, M.D.; Melius, C.F. Sandia National Labs., Livermore, CA (United States). Oct 1992. 64p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DR00789. Order Number DE93002598. Source: OSTI; NTIS; GPO Dep.

Ab initio electronic structure calculations coupled with empirical corrections are used to obtain a self-consistent set of heats of formation for molecules in the series CH_nSiCl_m (n, m = 0–3) and for selected molecules in the series $(CH_3)_nSiH_mCl_p$, Heats of formation are also reported for the series $Cl_nSiSiCl_m$ (m,n = 0-3) and for $HC{\equiv}CSiCl_2H$ and $H_2C{=}CH(SiCl_2H)$. Gibbs free energies as a function of temperature and standard entropies are given for all molecules in the study. Heats of formation are used to evaluate potential pathways for the decomposition of Cl_3SiCH_3, a common silicon carbide chemical vapor deposition precursor. The analysis includes the calculation of the transition state for the 1,2-elimination of HCl from Cl_3SiCH_3.

1176 (SKB-TR–91-55) **Redox capacity of crystalline rocks. Laboratory studies under 100 bar oxygen gas pressure.** Pirhonen, V. (Technical Research Center of Finland, Esbo (Finland)); Pitkaenen, P. Swedish Nuclear Fuel and Waste Management Co., Stockholm (Sweden). Dec 1991. 61p. Order Number DE93603184. Source: OSTI; NTIS; INIS.

The excess amount of dissolved oxygen has been used as a reducible species in order to determine reducing ability (redox capacity) of crystalline rocks and minerals in an aqueous granite solution. Both crushed and whole rock samples were used. The oxygen pressure was set to 100 bar both to promote diffusion and accelerate the surface reactions. The redox capacity was obtained as a function of the decrease of Fe (II) in the solid phase. The decrease of ferrous iron near the reaction surface ranged from about

2% up to 39%. All reacted samples showed a decrease of between 5-30% in the ratio of $FeII/Fe_{total}$ within a reaction zone at the rock surface. The reaction depth varied from about 0.1 cm up to more than 2.5 cm in rocks that were artificially ruptured and in naturally fractured granitic rocks, respectively. The redox capacity calculated from the average decrease of iron in profile varied from about 18 to 620 mol_{FeII}/m^3 and 320 to 580 mol_{FeII}/m^3 for the ruptured and the natural fracture samples, respectively. (6 refs., 4 figs., 5 tabs., 8 apps.) (au).

1177 (SKN–57) **Stability of metallic copper in the near surface environment.** Amcoff, Oe. (Uppsala Univ. (Sweden)); Holenyi, K. National Board for Spent Nuclear Fuel, Stockholm (Sweden). Mar 1992. 82p. Order Number DE93603185. Source: OSTI; NTIS; INIS.

The present study was initiated by the National Board for Spent Nuclear Fuel (SKN). It may be regarded as a review of the state of the art of copper stability - copper mobility in a low temperature - near surface environment. In the discussion, we have emphasized geological - geochemical milieus that have a direct bearing on the problem of final storage of spent nuclear fuel in copper canisters. The literature review has concentrated on copper in connection with: a. low-temperature environments, and b. Stability-mobility, with particular emphasis on a chloride-rich, sulphur-rich milieu. The possible influence on the present processes of radiolysis and engineered barriers besides copper is not discussed in this report. In order to faciliate the discussion, a number of examples on copper mineral stabilities and copper solubility etc. are given below, based on thermodynamic calculations. These calculations are simplified to a certain degree and the discussion is based on differences in orders of magnitude rather than on exact figures. The thermodynamic foundation for the calculations is given in an appendix. Conclusions and recommendations are outlined in general terms in a separate report. (59 refs.) (au).

1178 (STRIPA-TR–92-23) **Theoretical investigations of grout seal longevity - Final report.** Alcorn, S. (RE/SPEC Inc., Albuquerque, NM (United States)); Coons, W.; Christian-Frear, T.; Wallace, M. Swedish Nuclear Fuel and Waste Management Co., Stockholm (Sweden). Apr 1992. 90p. Order Number DE93603186. Source: OSTI; NTIS; INIS.

Theoretical investigations into the longevity of repository seals have dealt primarily with the development of a methodology to evaluate interactions between portland cement-based grout and groundwater. Evaluation of chemical thermodynamic equilibria between grout and groundwater, and among grout, groundwater, and granitic host rock phases using the geochemical codes EQ3NR/EQ6 suggests that a fracture filled with grout and saturated with groundwater will tend to fill and 'tighten' with time. Results of these investigations suggest that cement grout seals will maintain an acceptable level of performance for tens of thousands to millions of years, provided the repository is sited where groundwater chemistry is compatible with the seals and hydrologic gradients are low. The results of the grout: groundwater: rock calculations suggest that buffering of the fracture seals chemical systems by the granite rock may be important in determining the long-term fate of grout seals and the resulting phase assemblage in the fracture. The similarity of the modelled reaction products to those observed in naturally filled fractures suggests that with time equilibrium will be approached and grouted fractures subject to low hydrologic gradients will continue to seal. If grout injected into fractures materially reduces groundwater flux, the approach to chemical equilibrium will likely be accelerated. In light of this, even very thin or imperfectly grouted fractures would tighten in suitable hydrogeologic environments. (29 refs.) (au).

1179 (WSRC-MS–92-332) **Adsorption of a binary gas mixture which laterally interacts on a random heterogeneous surface.** Ritter, J.A. Westinghouse Savannah River Co., Aiken, SC (United States). [1992]. 26p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. (CONF-921104–5: American Institute of Chemical Engineers annual meeting, Miami, FL (United States), 1-6 Nov 1992). Order Number DE93000706. Source: OSTI; NTIS; GPO Dep.

Analytical expressions for the adsorption of a binary gas mixture which laterally interacts on a heterogeneous surface are developed. The lateral interactions are of the Bragg-Williams type and the surface heterogeneity is modeled via a random distribution of sites described by a uniform distribution of Henry's Law constants. The parametric study shows that complex phase behavior can be predicted, including azeotropes and sigmoidal shaped X-Y diagrams. Also, this model may be useful for modeling and designing adsorption processes as it requires few iterations to simultaneously solve the implicit and coupled algebraic expressions.

Order Number DE92041313. Source: OSTI; NTIS; GPO Dep.

X-ray studies of Cr in Al oxide films have shown that 3- and 6-valent Cr may be present. 300 nm Al films were anodized, cathodized or exposed to $K_3Cr(CN)_6$, $NaMoO_4$, $KMnO_4$, or $NaVO_3$ solutions. Cathodized surfaces were then anodized in borate solution. X-ray absorption at glancing angle and fluorescence detection were used to study species incorporated in the oxide surface. The 3-valent Cr present was closely related to $Cr(OH)_3$. Absence of a pre-edge peak associated with the 6-valent Cr shows that conditions at the oxide surface did not produce chromates. $Cr(CN)_6^{3-}$ complex is not strongly absorbed on the surface, in contrast to chromates. The permanganate and vanadate solutions gave only 4-valent Mn and 5-valent V. The effective oxidation potential inside the oxide film is estimated. 11 refs., 2 figs., 2 tabs. (DLC)

1181 (LBL–32728) **Development and application of the quasi-potential transformation.** Pillay, B. Lawrence Berkeley Lab., CA (United States). Aug 1992. 82p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00098. Order Number DE93000580. Source: OSTI; NTIS; GPO Dep.

The quasi-potential transformation, based on the Kirchhoff transformation, reduces the equations governing mass-transfer in a steady-state, nonconvective electrolytic system into two independent parts. The geometry-specific part involves the solution of Laplace's equation subject to the relevant boundary conditions. The system-specific part involves the solution of a set of coupled first-order, nonlinear, ordinary differential equations. We develop a theoretical basis for the quasi-potential transformation using potential theory. The major assumption on which the quasi-potential transformation is based is that the concentrations can be written as single-valued functions of the electrostatic potential. We see how the system-specific part of the calculation is developed. Boundary conditions are outlined, and the geometry-specific calculations for the disk and hemisphere electrodes are developed. We combine the system-specific calculations for the binary and acidic copper sulfate solutions with these geometry-specific calculations to obtain complete concentration profiles, potential distributions, and current density distributions for these systems. We also investigate the effect of migration on limiting currents.

Work in our laboratory has focused on the influence of solvent motion on the rates and energetics of photochemical charge separation in glassy solids. The efficiencies of many nonadiabatic electron transfer reactions involving photochemical electron donors with relatively low excited state energies, such as porphyrins and chlorophylls, are poor in the solid state. Recent work has shown that placing a porphyrin-acceptor system in a glassy solid at low temperature significantly raises the energy of ks ion-pair state. This destabilization can be as much as 0.8 eV relative to the ion pair state energy in a polar liquid. This contrasts sharply with photosynthetic reaction centers, which maintain medium-independent electron transfer rates with relatively small free energies of charge separation. Using this information we have set out to design photochemical systems that produce long-lived radical ion pairs in glassy solids with high quantum efficiency. These systems maintain their efficiency when placed in other glassy matrices, such as polymers. An important consequence of this effort is the design of molecules that minimize the electronic interaction between the oxidized donor and reduced acceptor. This minimization can be attained by careful design of the spacer groups linking the donor and acceptor and by using more than a single electron transfer step to increase the distance between the separated charges as is done in natural photosynthesis.

1183 (DOE/ER/13227–T4) **Pulsed laser kinetic studies of liquids under high pressure: Progress report, November 25, 1991–September 18, 1992.** Eyring, E.M. Utah Univ., Salt Lake City, UT (United States). 22 Sep 1992. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-84ER13227. Order Number DE93000884. Source: OSTI; NTIS; GPO Dep.

A laser flash photolysis kinetic study of 2,2′-bipyridine bidentate chelating ligands with one claw in the first coordination sphere of a molybdenum carbonyl complex has been completed at pressures up to 150 MPa. The reaction mechanism for thermal ring closure is found from activation volumes to change from associative interchange to dissociative interchange as substituents on the 2,2′-bipyridine ligands become bulkier. In a similar study of more rigid, substituted phenanthroline bidentate ligands it was found that substituent bulkiness had little effect on the thermal ring closure mechanism. Stability constants for lithium ion complexes with crown ethers in a room temperature molten salt, fluorescence quantum yields for cresyl violet and several other dyes in solution, and the oxidation of alcohols by OsO_4 have also been investigated.

1184 (DOE/ER/13603–6) **Study of intermediates from transition metal excited-state electron-transfer reactions: [Annual] progress report, August 1, 1989–July 31, 1992.** Hoffman, M.Z. Boston Univ., MA (United States). Dept. of Chemistry. 31 Jul 1992. 19p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-86ER13603. Order Number DE93001681. Source: OSTI; NTIS; GPO Dep.

Conventional and fast-kinetics techniques of photochemistry, photophysics, radiation chemistry, and electrochemistry were used to study the intermediates involved in transition metal excited-state electron-transfer reactions. These intermediates were excited state of Ru(II) and Cr(III) photosensitizers, their reduced forms, and species formed in reactions of redox quenchers and electron-transfer agents. Of particular concern was the back electron-transfer reaction between the geminate pair formed in the redox quenching of the photosensitizers, and the dependence of its rate on solution medium and temperature in competition with transformation and cage escape processes. (DLC)

1185 (DOE/ER/13629–6) **Photophysics and photoredox processes at liquid-liquid interfaces: Progress report, April 1, 1990–September 1992.** Webber, S.E. Texas Univ., Austin, TX (United States). Dept. of Chemistry and Biochemistry. Sep 1992. 13p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG05-86ER13629. Order Number DE93001841. Source: OSTI; NTIS; GPO Dep.

This report is divided into four sections: (1) Recent work on polymers with covalently bound chromophores, primarily involving triplet state electron transfer quenching; (2) Pyrene and pyrene butyric acid adsorbed onto polystyrene latexes (microspheres); (3) Adsorption and micellization of amphiphilic block polymers with chromophores at the junction between the hydrophobic and hydrophilic part; (4) Adsorption of alternating polymers with grafted "combs" to improve adsorption onto a hydrophobic surface.

1186 (DOE/ER/13404–7) **The contribution of electronically excited states to the radiation chemistry of organic systems: Progress report, January 1, 1991–April 30, 1992.** Lipsky, S. Minnesota Univ., Minneapolis, MN (United States). Dept. of Chemistry. [1992]. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-85ER13404. Order Number DE92040465. Source: OSTI; NTIS; GPO Dep.

At low concentrations ($\leq 10^{-3}$M) of aromatic solutes in saturated. hydrocarbon solvents, very efficient transport of electronic energy from photo-excited solvent to aromatic is observed. Effects of temperature, dilution, and quenching additives are being studied. Two-photon pulsed laser excitation gives no evidence of long lived metastable states. The fluorescence quantum yields of saturated hydrocarbon liquids have been studied for excitation wavelengths from 200 to 120 nm. For many compounds, the quantum yields for fluorescence are observed to decline to a minimum value at, or near, previously reported ionization thresholds. At higher energies, the magnitude of the quantum yield for fluorescence begins to increase. Magnetic field effects on intensity of steady-state recombination fluorescence have been observed both for photo-generated and B^- generated, electron and positive ion geminate pairs in saturated hydrocarbon liquids. The comparison indicates an important contribution . to observed recombination fluorescence from multiple ion-pairs under radiation chemical conditions. For photo-excited aromatic solutes dissolved in saturated hydrocarbon liquids, no magnetic field effect could be observed until surprisingly large excess energies above the threshold for ionization were achieved. This suggests a much smaller average range for the thermalized electron than expected from photoconductivity.

1187 (FRCEA-TH–370) **Study of unstable valences of cadmium and samarium by pulse radiolysis. Influence of complexation by some synthetical ionophores.** Lerat-Parizot, O. CEA Centre d'Etudes Nucleaires de Saclay, 91 - Gif-sur-Yvette (France). Direction des Sciences de la Matiere; Paris-11 Univ., 91 - Orsay (France). 16 Jun 1992. 196p. (In French). Order Number DE93721138. Source: OSTI; NTIS (US Sales Only); INIS.

Instable valences of cations in solution are evidenced by pulse radiolysis, in spite of a lifetime often lower than a milli-second they participate to electron transfer reactions, owing to their redox potential. In this work are studied Cd^+ and Sm^{2+} obtained respectively by reduction of Cd^{2+} and Sm^{3+} by a solvated electron. The reactivity of Cd^+ in a cryptand and in a coronand is studied; it is a powerful reducing agent (redox potential -2V) going back to the stable valence by electron transfer to an acceptor. Transfer kinetics is studied by reduction of organic molecules, effect of solvents and ligands is also examined. For samarium the reduction kinetics by hydrated electrons is increased when the ion is in a cryptand in agreement with electrochemical observations, showing that the valence 2+ is stabilized in respect to the valence 3+ for lanthanides. The difference of behaviour between Cd^+ and Sm^{2+} is probably due to the fact that for Cd the transferred electron comes from the external layer and for Sm it is a f electron protected by the 5s and 5p orbitals.

1188 (BARC–1991/E/022) **Removal of cesium from low level waste solutions by copper hexacyanoferrate loaded resins.** Singh, I.J. (Bhabha Atomic Research Centre, Bombay (India). Process Engineering and Systems Div.); Ramaswamy, M. Bhabha Atomic Research Centre, Bombay (India). 1991. 18p. Order Number DE93605220. Source: OSTI; NTIS (US Sales Only); INIS.

Sorbents for the separation of radio cesium from aqueous solutions were synthesized by incorporating copper hexacyanoferrate

(II) in the matrix of anion exchange resins of Indian origin, viz. Indion-810 and Tulsion-A27MP. Their efficiency for the cesium removal was tested under both static and dynamic conditions. The resins were found to be highly selective for radio cesium from a variety of salt and acid solutions. In general, Tulsion-based resins showed more tolerance towards chemical load in the solutions than the other. Pilot column run with Indion-based loaded resin showed that it effectively removed all the cesium activity from few thousands of litres of mixed low level waste streams from reactors, fuel reprocessing plant and nuclear laboratories. (author). 24 refs., 2 figs., 3 tabs.

1189 (CEA-CONF–10978) **Extraction of actinides from chloride medium using pentaalkylpropanediamides.** Cuillerdier, C.; Musikas, C. CEA Centre d'Etudes de la Vallee du Rhone, 30 - Marcoule (France). Dept. des Procedes de Retraitement. 1991. 14p. (CONF-911049–: 7. symposium on separation science and technology for energy applications, Knoxville, TN (United States), 20-24 Oct 1991). Order Number DE93721040. Source: OSTI; NTIS (US Sales Only); INIS.

Pyrometallurgical processes for the purification of plutonium create waste solutions containing actinides, mainly americium, in chloride medium. Studies have been undertaken to study the extraction of actinides in chloride medium (hydrochloric acid mixed with concentrated salts such as LiCl, $CaCl_2$, $MgCl_2$, KCl) using pentaalkylpropanediamides as extractants. Plutonium (IV) is very easily extracted, Am (III) needs a salting out agent such as LiCl. Back extraction of trivalent cations is easy in HCl <5M. Plutonium(IV) and (VI) can be stripped by reduction either with ascorbic acid or hydroxylammonium salts in weak acid medium. Several diluents can be used (aromatic, chlorinated or even aliphatic) with addition of decanol to prevent third phase formation. In conclusion diamides can be used for various wastes declassification, they are potentially completely incinerable, and, as the synthesis has been optimized, they appear to be promising extractants.

1190 (CEAC-R–1-92) **Obtention of thin depositions by the vacuum evaporation technique.** Gonzalez Mateu, D. (Centro de Estudios Aplicados al Desarrollo Nuclear (CEADEN), La Habana (Cuba)); Labrada, A.; Voronin, A. Comision de Energia Atomica, La Habana (Cuba). 1991 9p. (In Spanish). Order Number DE93603199. Source: OSTI; NTIS (US Sales Only); INIS.

The vacuum evaporating technique used to prepare thin depositions, and the technical characteristics of the constructed installation are described. ^{235}U y ^{238}U nuclear target for the fission researches were obtained. Aluminium and gold self-supporting foils were obtained too.

1191 (FRCEA-TH–371) **Synthesis and reactivity of triscyclopentadienyl uranium (III) and (IV) complexes.** Berthet, J.C. CEA Centre d'Etudes Nucleaires de Saclay, 91 - Gif-sur-Yvette (France). Direction des Sciences de la Matiere; Paris-11 Univ., 91 - Orsay (France). 15 Jun 1992. 257p. (In French). Order Number DE93721137. Source: OSTI; NTIS (US Sales Only); INIS.

The reactions of $(RC_5H_4)_3U$ with R=trimethylsilylcyclopentadienyl or tertiobutylcyclopentadienyl are studied for the synthesis of new uranium organometallic compounds. Reactions with sodium hydride are first described uranium (III) anionic hydrides obtained are oxidized for synthesis of stable uranium (IV) organometallic hydrides. Stability of these compounds is discussed. Reactivity of these uranium (III) and (IV) hydrides are studied. Formation of new binuclear compounds with strong U-O and U-N bonds is examined and crystal structure are presented. Monocyclooctatetraenylic uranium complexes are also investigated.

1192 (IGC–126) **Radiochemistry programme : biennial progress report (1988 - 1989).** Indira Gandhi Centre for Atomic Research, Kalpakkam (India). 1991. 159p. Order Number DE93605214. Source: OSTI; NTIS (US Sales Only); INIS.

The Research and Development activities of the Radiochemistry Division of Indira Gandhi Centre for Atomic Research, Kalpakkam during the period 1988-89 are desribed in the form of summaries. The main thrust of R and D activities is on fast breeder reactor technology. The summarises are arranged under the headings : (1) Chemistry of Liquid Alkali Metals, (2) High Temperature Chemistry of Advanced Materials, (3) Chemistry of Nuclear Fuel Reprocessing, (4) Post-Irradiation analysis and Nuclear Chemistry, (5) Analytical Characterisation of Materials, (6) Analytical Services and (7) Instrumentation and Mechanical Services. At the end, a list of publications by scientists of the Division published during the report period is given. The list includes papers published in journals, papers presented at various symposia, conferences etc, and technical reports. (author). tabs., figs.

1193 (INFO–0364) **Properties of unattached polonium-218 in the propylene-nitrogen gas system.** Phillips, C.R. (Chemical Engineering Research Consultants Limited (Canada)). Atomic Energy Control Board, Ottawa, ON (Canada). Oct 1988. 25p. Project 4.123.1. Order Number DE93603197. Source: OSTI; NTIS (US Sales Only); INIS.

Electrostatic and diffusion properties of unattached polonium 218 were investigated in a propylene-nitrogen gas system. The diffusion coefficient of neutral unattached polonium 218 under various relative humidities was measured and was found to be lowered by humidity owing to the formation of clusters. The fraction of polonium 218 having a positive charge at a gas age of about 0.1 second was determined. The mobility of the charged polonium 218 was obtained independently by using a pulse width modulated ion mobility analyzer, which employed the time of flight method. The diffusion coefficient and mobility data obtained fitted the Einstein equation on the assumption that the polonium 218 ion has one positive charge. The neutralization rate constant of polonium 218 ions under various relative humidities and radon concentrations was investigated, and three neutralization mechanisms were observed. The neutralization rate constant is proportional to the 0.2 power of the radon concentration at all relative humidities, suggesting that the small ion recombination mechanism plays an important role. The charge transfer mechanism involving propylene and polonium hydroxide ions is responsible for lowering the power dependence of the neutralization rate constant on radon concentration from 0.5 (in nitrogen) to 0.2 (in propylene-nitrogen). The presence of the electron scavenging mechanism involving hydroxyl groups formed from water vapour radiolysis causes the neutralization rate constant to increase with relative humidity. (12 refs., 3 figs., 5 tabs.).

1196 (KAERI/RR–1029/91) **A study on ion separation through liquid membrane.** Kang, Young Ho (Korea Atomic Energy Research Inst., Daeduk (Korea, Republic of)); Kwon, Sun Kil; Joo, Jae Oh; Whang, Sung Chan; Kim, Jung Do; Ann, Hyun Suk. Korea Atomic Energy Research Inst., Daeduk (Korea, Republic of). Dec 1991. 61p. (In Korean). Order Number DE93605215. Source: OSTI; NTIS (US Sales Only); INIS.

The flux of uranyl nitrate across cellulose acetate was determined using TOPO as a carrier. TOPO particles were physically entrapped in the membrane, which prepared by phase inversion method. The dominating factors were the amount of plasticizer, CTA-TOPO ratio in the membrane, uranium concentration in the feed solution, acidity and the solution temperature. And the transport phenomena of uranyl nitrate across this membrane were microscopically analysed by SEM. The increase of the membrane stability was observed when TOPO was used as a carrier. Another new technology to economically reduce the low-level liquid waste through the membrane is tested in a laboratory scale. (Author).

1197 (KAERI/RR–1091/91) **Production of cyclotron radionuclides.** Lee, Jong Doo (Korea Atomic Energy Research Inst., Daeduk (Korea, Republic of)); Jeon, Kwon Soo; Yang, Seong Dae; Seo, Yang Sup; Chae, Jong Seo; Yoon, Yong Ki; Park, Hyun; Koo, Young Yoon. Korea Atomic Energy Research Inst., Daeduk (Korea, Republic of). Feb 1992. 21p. (In Korean). Order Number DE93605221. Source: OSTI; NTIS (US Sales Only); INIS.

In the project, 563mCi of Ga-67 and 45mCi of Tl-201 were supplied, the mass production method of Ga-67 was established by using enriched Zn-68 target material and 449mCi of I-123 was produced for the biological application. For the promotion of RI sale, the legal basis was arranged and the supply system was reorganized. For the efficient use of the cyclotron, the MC-50 cyclotron was opened to outside users and three basic research projects were carried out. The technical supports and radionuclides analysis were done during the execution of the research projects. And, the target cooling system and RI handling techniques accompanying for radioisotope production were improved. (Author).

1198 (KAERI/RR–1102/91) **Studies on the preparation of labelled compounds for γ-scintigraphy use.** Park, Kyung Bae (Korea Atomic Energy Research Inst., Daeduk (Korea, Republic of)); Kim, Jae Rok; Awh, Ok Doo; Sin, Byung Cheul; Park, Woong Woo; Han, Kwang Hee. Korea Atomic Energy Research Inst., Daeduk (Korea, Republic of). Mar 1992. 45p. (In Korean). Order Number DE93605222. Source: OSTI; NTIS (US Sales Only); INIS.

1. ^{165}Dy-HMA for treating rheumatoid arthritis 1) Irradiation of 12 mg $^{164}Dy_2O_3$ showing specific activity (SA)of $2x10^{13}$ n/cm^{2}s for 4 h gave $^{165}Dy_2O_3$ showing SA≈480 mCi/mg and radionuclidic purity >99.9%. 2) ^{165}Dy-HMA was prepared in yield of 80-85% from $^{165}DyCl_3$ solution made by dissolving $^{165}Dy_2O_3$ with HCl and adjusting pH to 3.0, and then followed by the treatment with aq NaOH solution. 3) Serial filtration using polycarbonate filter (1-10μm) of ^{165}Dy-HMA suspension in saline after treatment with sonificator exhibited majority of particles in the 3-8μm range. 4) Even though the ^{165}Dy-HMA suspension in saline was left to stand for 24 h at room temperature, there was no significant change in particle size resulting in high stability of ^{165}Dy-HMA. 2. Study on the 99mTc labelling of bioactive material 1) The labelling of antibody [F(ab')$_2$] coupled to DTPA with Na99mTcO$_4$ in the presence of Na dithionite(μg) gave labelling yield of 40% determined by ITLC-SG. 2) The labelling of 500μl of antibody solution in phosphate buffer(0.2M, pH 7.4, 1.5mg antibody/ml) with $Na^{131}I$(3-5mCi) in the presence of chloramine-T(0.14mg) for 30 min at room temperature exibited labelling yield of 60-70%, radiochemical purity of 97%, specific activity of 1.2-3.5 mCi/mg, respectively, determined by ITLC-SG. 3) Results obtained from the animal experiment in rabbit to study the specificity and sensitivity of ^{131}I labelled antibody exhibited hot uptake until 72 h in the case of tuberculous infection, with the highest target/background ratio(2.52) at 24 h after injection of ^{131}I-F(ab')$_2$ 4) In the case of rabbit infected with syphilitic orchitis, it exhibited the highest target/background ratio(3.51) at 2 h after injection and showed fast decrease.

1199 (ANL/CP–77468) **Incineration of toluene and chlorobenzene in a laboratory incinerator.** Mao, Z.; Mcintosh, M.J.; Demirgian, J.C. Argonne National Lab., IL (United States). [1992]. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-9209160–12: International symposium on energy, environment and information management, Argonne, IL (United States), 15-18 Sep 1992). Order Number DE92041089. Source: OSTI; NTIS; INIS; GPO Dep.

This paper reports experimental results on the incineration of toluene and chlorobenzene in a small laboratory incinerator. Temperature of the incinerator, excess air ratio and mean residence time were varied to simulate both complete and incomplete combustion conditions. The flue gas was monitored on line using Fourier transform infrared (FTIR) spectroscopy coupling with a heated long path cell (LPC). Methane, toluene, benzene, chlorobenzene, hydrogen chloride and carbon monoxide in the flue gas were simultaneously analyzed. Experimental results indicate that benzene is a major product of incomplete combustion (PIC) besides carbon monoxide in the incineration of toluene and chlorobenzene, and is very sensitive to combustion conditions. This suggests that benzene is a target analyle to be monitored in full-scale incinerators.

1200 (DOE/ER/13878–4) **[Homogeneous-heterogeneous combustion: Thermal and chemical coupling]: [Annual report] research in progress.** Minnesota Univ., Minneapolis, MN (United States). Jan 1992. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-88ER13878. Order Number DE93002881. Source: OSTI; NTIS; GPO Dep.

This is a program to characterize fundamental issues and practical applications of homogeneous-heterogeneous reactions. Fundamental studies of reactions at low pressures and of boundary layer characterization give microscopic information on the processes. Ignition and extinction studies over simple geometries give basic bifurcation behavior with which to characterize multiple steady states and their stabilities and hopefully to identify the types of behavior which may occur. Use of catalytic monoliths will permit examination of the chemical and thermal performance of one of the most important types of geometries in which both types of reaction can occur. Modeling will tie all of these aspects together by showing how individual components interact, Predicting performance of monoliths, and providing the framework for translating these ideas into technological contexts.

42 ENGINEERING

1201 (DOE/ER/13572–3) **Linear oscillations of a drop in uniform alternating electric fields: [Annual report, 1989].** Yang, Wenrui; Carleson, T.E. Idaho Univ., Moscow, ID (United States). Dept. of Chemical Engineering. Oct 1990. 24p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG07-86ER13572. (CONF-901155–8: American Institute of Chemical Engineers (AIChE) fall annual meeting, Chicago, IL (United States), 11-16 Nov 1990). Order Number DE92040895. Source: OSTI; NTIS; GPO Dep.

Oscillations of a conducting drop immersed in a dielectric fluid in an alternating electric field has been modelled in order to understand the enhancement of the transport processes by the electric field. Numerical solutions for oscillation amplitude, velocity distribution, resonant frequency and streamlines were obtained. The effects of viscosity and density on the resonant frequency and the velocity distribution were investigated. It was found that the resonant frequency of viscous fluids was always smaller than the free oscillation frequency of the same droplet. The predicted scanning frequency response curve and the streamlines agree well with the experimental observations.

1202 (CONF-9202137–1) **Mobile manipulator configuration optimization using evolutionary programming.** McDonnell, J.R. (Naval Command, Control and Ocean Surveillance Center, San Diego, CA (United States)); Andersen, B.L.; Page, W.C.; Pin, F.G. Oak Ridge National Lab., TN (United States). [1992]. 13p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From 1. annual conference on evolutionary programming; La Jolla, CA (United States); 21-22 Feb 1992. Order Number DE92041307. Source: OSTI; NTIS; GPO Dep.

Multi-degree-of-freedom manipulators are becoming commonplace on mobile platforms. Full autonomy of mobile manipulator robotic systems will depend on the ability to resolve the inherent kinematic redundancy in task commutation. This work investigates the application of an evolutionary search strategy for determining near-optimal mobile manipulator configurations. Joint torques, obstacle avoidance and manipulability are incorporated in a multi-criteria optimization formulation. A variety of aspects of the evolutionary programming paradigm are addressed via empirical studies on a two degree-of-freedom (DOF) manipulator. These studies investigate full configuration vector versus partial configuration vector mutation as well as mutation strategies which incorporate cost and iteration number. The results of this study are then applied to a planar three DOF manipulator mounted on a single DOF mobile base. Experiments indicate that the configuration optimization problem is amenable to a variety of mutation strategies.

1203 (CONF-920905–19) **A revision of the Cask Designers Guide for the '90s.** Shappert, L.B.; Green, V.M. Oak Ridge National Lab., TN (United States). [1992]. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From 10. international symposium on the packaging and transportation of radioactive materials: PATRAM '92; Yokohama (Japan); 13-18 Sep 1992. Order Number DE92041254. Source: OSTI; NTIS; INIS; GPO Dep.

The report A Guide for the Design Fabrication, and Operation of Shipping Casks for Nuclear Applications, ORNL-NSIC-68, commonly called the Cask Designers Guide, is being revised at the request of the Transportation and Packaging Safety Division of the Department of Energy (DOE). The new document will be called the Packaging Handbook. The Cask Designers Guide was published in 1970 during the period when many radioactive materials packagings were being developed and many technical studies applicable to these packagings were being performed. Since that period, many improvements in packaging design have appeared, designers have improved their calculational techniques, and much effort has gone into applying Quality Assurance (QA) principles to cask development Materials, and their limitations, have surfaced as a very important consideration in the licensing process. While the Packaging Handbook considers all Type B packages, most of the authors' experience lies in the technical areas found in the licensing of spent nuclear fuel (SNF) packagings and this is reflected in the document.

1204 (CONF-920905–20) **Drop testing of the Westinghouse fresh nuclear fuel package.** Shappert, L.B. (Oak Ridge National Lab., TN (United States)); Sanders, C.F. Oak Ridge National Lab., TN (United States). [1992]. 9p. Sponsored by Nuclear Regulatory Commission, Washington, DC (United States). DOE Contract AC05-84OR21400. From 10. international symposium on the packaging and transportation of radioactive materials: PATRAM '92; Yokohama (Japan); 13-18 Sep 1992. Order Number DE92041255. Source: OSTI; NTIS; INIS; GPO Dep.

In recent years, the Westinghouse Columbia Fuel Fabrication Facility has been faced with increasing pressure from utilities that wished to take the fuel in their nuclear power plants to higher burnups. To help accommodate this trend, Westinghouse has determined that it needs the ability to increase the enrichment of the fresh fuel it delivers to its customers. One critical step in this process is to certify a new (Type A, fissile) fresh fuel package design that has the capability to transport fuel with a higher enrichment than was previously available. A prototype package was tested in support of the Safety Analysis Report of the Packaging. This paper provides detailed information on those tests and their results.

1205 (CONF-9210168–1) **Sensor-based whole-arm obstacle avoidance for unstructured environments.** Wintenberg, A.L.; Butler, P.L.; Babcock, S.M.; Ericson, M.N.; Armstrong, G.A.; Britton, C.L. Jr.; Hamel, W.R. Oak Ridge National Lab., TN (United States). [1992]. 25p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From 1992 American Nuclear Society (ANS) international conference; Chicago, IL (United States); 15-20 Oct 1992. Order Number DE92041265. Source: OSTI; NTIS; INIS; GPO Dep.

Whole-arm obstacle avoidance is needed for a variety of robotic applications in the Environmental Restoration and Waste Management (ER&WM) Program. Typical industrial applications of robotics involve well-defined workspaces, allowing a predetermined knowledge of collision-free paths for manipulator motion. However, many hazardous environments are unstructured or poorly defined, providing a significant potential for collisions between manipulators and the environment. In order to allow applications of robotics in such situations, a sensing system is under development which will provide protection against collisions. Specifics of this system including system architecture and projected implementation are described.

1206 (DPW–5411) **Charging crane tests: Minutes of meeting.** Carleton, J.T. Du Pont de Nemours (E.I.) and Co., Wilmington, DE (United States). 16 May 1952. 2p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-76SR00001. (SR/H–225). Order Number DE93001458. Source: OSTI; NTIS (US Sales Only); GPO Dep.

A meeting was held on May 6, 1952 to discuss tests to be carried out on the charging crane assembly in the Brooklyn shop of the American Machine and Foundry Co. (JL)

1207 (DPW–5520) **Project 8980: Savannah River Plant, 200 Area, 221 Building: Excerpts from Hanford reports, September to December 1951, TBP, UO_3 and Redox plants.** Moore, P.R. Du Pont de Nemours (E.I.) and Co., Wilmington, DE (United States). Explosives Dept. 2 Jun 1952. 13p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-76SR00001. (SR/H–236). Order Number DE93001913. Source: OSTI; NTIS (US Sales Only); GPO Dep.

We report herewith for your information certain items abstracted from the monthly reports of Hanford Works in regard to problems encountered during recent construction and start-up of new facilities. This report is dated June 2, 1952. (JL)

1208 (ETDE-IT–92-80) **Calculation of impulse current distributions and magnetic fields in lightning protection structures: Computer program laboratory validation.** Cortina, R.; Porrino, A. Ente Nazionale per l'Energia Elettrica, Milan (Italy). Centro di Ricerca Elettrica. 1991. 6p. Order Number DE93729441. Source: OSTI; NTIS (US Sales Only).

A circuital model and an ad-hoc computer program were set up to evaluate electromagnetic interference in the vicinity of protective structures struck by lightning. This program permits the evaluation of the impulsive magnetic fields by calculating the impulse current distribution in the different parts of such structures. It allows also the evaluation of the electromagnetic interference induced on susceptible victim circuits to which electric equipment may be connected. To validate the approach, a series of impulse tests were performed in the laboratory on conductive structures conceived to highlight the features of the program and to put into evidence the dependence of the impulse current distributions on some particular phenomena that need simplified modelling, e.g., the effect of induced or return currents through the ground.

1209 (EUR–14363) **Practical decommissioning experience with nuclear installations in the European Community.** Skupinski, E. (Commission of the European Communities, Brussels (Belgium)). Commission of the European Communities, Luxembourg (Luxembourg). 1992. 207p. (CONF-9109441–: 2. Seminar on practical decommissioning experience with nuclear installations in the European Community, Sellafield (United Kingdom), 25-26 Sep 1991). Source: OSTI; NTIS (US Sales Only); INIS.

Initiated by the Commission of the European Communities (CEC), this seminar was jointly organized by the AEA, BNFL and the CEC at Windermere and the sites of Windscale/Sellafield, where the former Windscale advanced gas-cooled reactor and the Windscale piles are currently being dismantled. The meeting aimed at gathering a limited number of European experts for the presentation and discussion of operations, results and conclusions on techniques and procedures currently applied in the dismantling of large scale nuclear installations in the European Community.

1210 (EUR–14363, pp. 95-110) **Recent decommissioning experience in BNFL.** Buck, S. (British Nuclear Fuels plc, Sellafield (United Kingdom)); Challinor, S.F. Commission of the European Communities, Luxembourg (Luxembourg). 1992. (CONF-9109441–: 2. Seminar on practical decommissioning experience with nuclear installations in the European Community, Sellafield (United Kingdom), 25-26 Sep 1991). In *Practical decommissioning experience with nuclear installations in the European Community.* 207p. Order Number DE93721081. Source: OSTI; NTIS (US Sales Only); INIS.

BNFL is now engaged in a long term programme to decommission surplus radioactive facilities. Certain projects have been deliberately selected to provide experience in decommissioning specific types of facilities whilst all have proven invaluable training grounds in decommissioning techniques and organisation. Four projects are included here, selected for the lessons and experience they have provided. These are the original Sellafield Fuel Storage Pond, a mixed oxide (Pu+U) fuel plant, redundant plutonium facilities within the main Magnox reprocessing plant, and the Capenhurst Gaseous Diffusion Uranium enrichment plant.

1214 (LA-UR–92-1981) **Impact modeling with Smooth Particle Hydrodynamics.** Stellingwerf, R.F.; Wingate, C.A. Los Alamos National Lab., NM (United States). [1992]. 14p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-921221–2: High velocity impact symposium, Austin, TX (United States), Dec 1992). Order Number DE92017506. Source: OSTI; NTIS; GPO Dep.

Smooth Particle Hydrodynamics (SPH) is a new computational technique uniquely suited to computation of hypervelocity impact phenomena. This paper reviews the characteristics, philosophy, and a bit of the derivation of the method. As illustrations of the technique, several test case computations and several application computations are shown.

1215 (LA-UR–92-2961) **Development of methodology for certification of Type B shipping containers using analytical and testing techniques.** Sharp, R.R.; Varley, D.T. Los Alamos National Lab., NM (United States). [1992]. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-920905–27: 10. international symposium on the packaging and transportation of radioactive materials: PATRAM '92, Yokohama (Japan), 13-18 Sep 1992). Order Number DE93000689. Source: OSTI; NTIS; INIS; GPO Dep.

The Analysis and Testing Group (WX-11) of the Design Engineering Division at Los Alamos National Laboratory (LANL) is developing methodology for designing and providing a basis for certification of Type B shipping containers. This methodology will include design, analysis, testing, fabrication, procurement, and obtaining certification of the Type B containers, allowing usage in support of the United States Department of Energy programs. While all aspects of the packaging development are included in this methodology, this paper focuses on the use of analysis and testing techniques for enhancing the design and providing a basis for certification. This methodology is based on concurrent engineering principles. Multidisciplinary teams within LANL are responsible for the design and certification of specific Type B Radioactive Material Shipping Containers. These teams include personnel with the various backgrounds and areas of expertise required to support the design, testing, analysis and certification tasks. To demonstrate that a package can pass all the performance requirements, the design needs to be characterized as completely as possible. Understanding package responses to the various environments and how these responses influence the effectiveness of the packaging requires expertise in several disciplines. In addition to characterizing the shipping container designs, these multidisciplinary teams should be able to provide insight into improving new package designs.

1216 (LA-UR–92-3074) **Modification of earth-satellite orbits using medium-energy pulsed lasers.** Phipps, C.R. Los Alamos National Lab., NM (United States). [1992]. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-920959–2: 9. international symposium on gas flow and chemical lasers, Heraklion (Greece), 21-25 Sep 1992) Order Number DE93000858. Source: OSTI; NTIS; GPO Dep.

Laser Impulse Space Propulsion (LISP) has become an attractive concept, due to recent advances in gas laser technology, high-speed segmented mirrors and improved coeffici-ents for momentum coupling to targets in pulsed laser ablation. There are numerous specialized applications of the basic concept to space science-ranging from far-future and high capital cost to the immediate and inexpensive, such as: LEO-LISP (launch of massive objects into low-Earth-Orbit at dramatically improved cost-per-kg relative to present practice); LEGO-LISP (LEO to geosynchronous transfers); LO-LISP) (periodic re-boost of decaying LEO orbits) and LISK (geosynchronous satellite station-keeping). It is unlikely that one type of laser will be best for all scenarios. In this paper, we will focus on the last two applications.

1217 (LA-UR–92-3182) **Part mounting revisited.** Hannah, P.R.; Garcia, F.P.; Stewart, D.D. Los Alamos National Lab., NM (United States). [1992]. 13p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-9210104–4: 7. annual conference of the American Society for Precision Engineering (ASPE), Orlando, FL (United States), 18-23 Oct 1992). Order Number DE93000871. Source: OSTI; NTIS; GPO Dep.

Having been involved with single point diamond turning since the 1960's; I share with others of my age, a unique perspective of the craft. I am amazed at how the fundamentals seem to be forgotten or misplaced, and need to be re emphasized and re learned. Each new precision machine operator not only needs to re learn (many

times the hard way), these fundamentals, but seems to inherit all the folklore; good and bad, from his predecessor. Let me explain. I spend some of my time as a consultant to the shops' division at the Los Alamos National Laboratory, at which there are five precision turning machines divided between two buildings. The main shop area houses an old friction way (hydrodynamic) turning Machine. The base of this turning machine is made from the base of an old Moore measuring machine. The air bearing spindle, a "Red Head" was made by the Heald Machine Tool Co. With the addition of an Allen-Bradley Numerical control system, this machine has become a work horse, used primarily to make smooth flat surfaces in the fly-cutting mode. Recently, I became involved in the evaluation and repair of the machine as it no longer produced smooth surfaces. Smooth surfaces are not the point of this narrative, accurate geometry however is.

1218 (ORNL/TM–12163) **Preparing EBS messages.** Vogt, B.M., Sorensen, J.H. Oak Ridge National Lab., TN (United States). Sep 1992. 34p. Sponsored by Federal Emergency Management Agency, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE93000835. Source: OSTI; NTIS; GPO Dep.

Warning messages transmitted to populations at risk from an accidental release of chemical agent must be carefully designed to maximize appropriate responses from affected publics. This guide develops an approach for preparing Emergency Broadcast System (EBS) messages for the Chemical Stockpile Emergency Preparedness Program (CSEPP). Sample messages illustrate the application of this approach. While the sample messages do not cover every emergency situation, the texts are generic in that accident and location specific factors can be incorporated into the final message developed by local emergency planners. Thus they provide a starting point, not an end product, for emergency planners.

1219 (ORNL/TM–12165) **Input relegation control for gross motion of a kinematically redundant manipulator.** Unseren, M.A. Oak Ridge National Lab., TN (United States). Oct 1992. 40p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE93002735. Source: OSTI; NTIS; GPO Dep.

This report proposes a method for resolving the kinematic redundancy of a serial link manipulator moving in a three-dimensional workspace. The underspecified problem of solving for the joint velocities based on the classical kinematic velocity model is transformed into a well-specified problem. This is accomplished by augmenting the original model with additional equations which relate a new vector variable quantifying the redundant degrees of freedom (DOF) to the joint velocities. The resulting augmented system yields a well specified solution for the joint velocities. Methods for selecting the redundant DOF quantifying variable and the transformation matrix relating it to the joint velocities are presented so as to obtain a minimum Euclidean norm solution for the joint velocities. The approach is also applied to the problem of resolving the kinematic redundancy at the acceleration level. Upon resolving the kinematic redundancy, a rigid body dynamical model governing the gross motion of the manipulator is derived. A control architecture is suggested which according to the model, decouples the Cartesian space DOF and the redundant DOF.

1220 (PNL–8330) **Pacific Northwest Laboratory FY 1993 Site Maintenance Plan for maintenance of DOE nonnuclear facilities.** Bright, J.D. Pacific Northwest Lab., Richland, WA (United States). 28 Sep 1992. 101p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE93000841. Source: OSTI; NTIS; GPO Dep.

This Site Maintenance Plan has been developed for Pacific Northwest Laboratory's (PNL) Nonnuclear Facilities. It is based on requirements specified by US Department of Energy (DOE) Order 4330.4A, Chapter I, Change No. 4. The objective of this maintenance plan is to provide baseline information for compliance to the DOE Order 4330.4A, to identify needed improvements, and to document the planned maintenance budget for Fiscal Year (FY) 1993 and to estimate maintenance budgets for FY 1994 and FY 1995 for all PNL facilities. Using the results of the self-assessment, PNL has selected 12 of the 36 elements of the Maintenance Program defined by DOE Order 4330.4A, Chapter I, for improvement. The elements selected for improvement are: Facility Condition Inspections; Work Request (Order) System; Formal Job Planning and Estimating; Work Performance (Time) Standards; Priority System; Maintenance Procedures and Other Work-Related Documents; Scheduling System; Post Maintenance Testing; Backlog Work Control; Equipment Repair History and Vendor Information; Work Sampling; and Identification and Control. Based upon a graded approach and current funding, those elements considered most important have been selected as goals for earliest compliance. Commitment dates for these elements have been established for compliance. The remaining elements of noncompliance will be targeted for implementation during later budget periods.

1221 (PNL-SA–20751) **Power beaming providing a space power infrastructure.** Bamberger, J.A.; Coomes, E.P. Pacific Northwest Lab., Richland, WA (United States). Aug 1992. 7p. Sponsored by Department of Defense, Washington, DC (United States). DOE Contract AC06-76RL01830. (CONF-920801–26: 27. intersociety energy conversion engineering conference, San Diego, CA (United States), 3-7 Aug 1992). Order Number DE93000850. Source: OSTI; NTIS; GPO Dep.

This study, based on two levels of technology, applies the power beaming concept to four planned satellite constellations. The analysis shows that with currently available technology, power beaming can provide mass savings to constellations in orbits ranging from low earth orbit to geosynchronous orbit. Two constellations, space surveillance and tracking system and space based radar, can be supported with current technology. The other two constellations, space-based laser array and boost surveillance and tracking system, will require power and transmission system improvements before their breakeven specific mass is achieved. A doubling of SP-100 conversion efficiency from 10 to 20/% would meet or exceed breakeven for these constellations.

1222 (SAND–91-2255C) **Comparison of 10 CFR 71 normal conditions with bounding US "hot day" extremes.** Brown, N.N. (Sandia National Labs., Albuquerque, NM (United States)); Gianoulakis, S.E.; Lake, W.H. Sandia National Labs., Albuquerque, NM (United States). [1991]. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. (CONF-920631–47: American Society of Mechanical Engineers pressure vessel and piping conference, New Orleans, LA (United States), 21-25 Jun 1992). Order Number DE92040976. Source: OSTI; NTIS; INIS; GPO Dep.

Simple thermal models representing surface and near-surface conditions of spent fuel casks are developed to assess the behavior of such cask regions to normal hot day conditions of 10 CFR 71 and bounding hot day extreme environments within the continental US. In general, it is found that the relatively simple regulatory conditions for hot day environments are reasonable predictors of bounding cask responses to actual hot day extremes. For cask configurations whose outer regions can be described as thin plates with adiabatic backfaces, designers need to assure adequate thermal design margins for temperature-sensitive surface components.

1223 (SAND–91-2602C) **Intermodal transfer of spent fuel.** Neuhauser, K.S. (Sandia National Labs., Albuquerque, NM (United States)); Weiner, R.F. Sandia National Labs., Albuquerque, NM (United States). [1991]. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. (TTC–1120;CONF-920905–29: 10. international symposium on the packaging and transportation of radioactive materials: PATRAM '92, Yokohama (Japan), 13-18 Sep 1992). Order Number DE93000720. Source: OSTI; NTIS; INIS; GPO Dep.

As a result of the international standardization of containerized cargo handling in ports around the world, maritime shipment handling is particularly uniform. Thus, handier exposure parameters will be relatively constant for ship-truck and ship-rail transfers at ports throughout the world. Inspectors' doses are expected to vary because of jurisdictional considerations. The results of this study should be applicable to truck-to-rail transfers. A study of the movement of spent fuel casks through ports, including the loading and unloading of containers from cargo vessels, afforded an opportunity to estimate the radiation doses to those individuals handling the spent fuels with doses to the public along subsequent transportation routes of the fuel. A number of states require redundant

inspections and for escorts over long distances on highways; thus handlers, inspectors, escort personnel, and others who are not normally classified as radiation workers may sustain doses high enough to warrant concern about occupational safety. This paper addresses the question of radiation safety for these workers. Data were obtained during, observation of the offloading of reactor spent fuel (research reactor spent fuel, in this instance) which included estimates of exposure times and distances for handlers, inspectors and other workers during offloading and overnight storage. Exposure times and distance were also for other workers, including crane operators, scale operators, security personnel and truck drivers. RADTRAN calculational models and parameter values then facilitated estimation of the dose to workers during incident-free ship-to-truck transfer of spent fuel.

1224 (SAND–91-2666C) **Results of the Sandia National Laboratories MOSAIK cask drop test program.** Sorenson, K.; Salzbrenner, R.; Wellman, G.; Bobbe, J. Sandia National Labs., Albuquerque, NM (United States). [1991]. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. (CONF-920905–25: 10. international symposium on the packaging and transportation of radioactive materials: PATRAM '92, Yokohama (Japan), 13-18 Sep 1992). Order Number DE92041161. Source: OSTI; NTIS; GPO Dep.

There has been a significant international effort over the past ten years to qualify structural materials for construction of radioactive material (RAM) transportation casks. As total life cycle cost analyses argue the necessity for more efficient casks, new candidate structural materials are evaluated relative to the historically accepted austenitic stainless steels. New candidate cask containment materials include ferritic steels, ductile iron, depleted uranium, and titanium. Another material, borated stainless steel is being considered for structural cask internals because of its neutron absorption properties. The mechanical performance of the borated stainless steels is a function of the boron content and metallurgical processing conditions. A separate paper in this symposium (Stephens et al. 1992) deals with the properties of a range of borated stainless steels. A major technical issue involved with the qualification of afl these candidate materials is that they may, under certain combinations of mechanical and environmental loading, fail in a brittle fashion. Such a failure would of course not be acceptable for a RAM transport cask involved in an accident. The cask designer must assure cask owners, regulators as well as the general public that the cask will not undergo brittle fracture for all regulatory loading conditions. This paper summarizes the drop tests that were conducted using the MOSAIK casks to verify the fracture mechanics cask design approach and to demonstrate that ductile iron could be subjected to severe loading conditions without failing in a brittle manner.

1225 (SAND–91-2669C) **Burnup credit issues in transportation and storage.** Brady, M.C. (Sandia National Labs., Albuquerque, NM (United States)); Sanders, T.L.; Seager, K.D.; Lake, W.H. Sandia National Labs., Albuquerque, NM (United States). [1992]. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. (CONF-920905–35: 10. international symposium on the packaging and transportation of radioactive materials: PATRAM '92, Yokohama (Japan), 13-18 Sep 1992). Order Number DE93000744. Source: OSTI; NTIS; INIS; GPO Dep.

Reliance on the reduced reactivity of spent fuel for criticality control during transportation and storage is referred to as burnup credit. This concept has attracted international interest and is being actively pursued in the United States in the development of a new generation of transport casks. An overview of the US experience in developing a methodology to implement burnup credit in an integrated approach to transport cask design is presented in this paper. Specifically, technical issues related to the analysis, validation and implementation of burnup credit are identified and discussed.

1226 (SAND–91-2687C) **Transportation package design using numerical optimization.** Harding, D.C.; Witkowski, W.R. Sandia National Labs., Albuquerque, NM (United States). [1991]. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. (CONF-920905–11: 10. international symposium on the packaging and transportation of radioactive materials: PATRAM '92, Yokohama (Japan), 13-18 Sep 1992). Order Number DE92041147. Source: OSTI; NTIS; INIS; GPO Dep.

The purpose of this overview is twofold: first, to outline the theory and basic elements of numerical optimization; and second, to show how numerical optimization can be applied to the transportation packaging industry and used to increase efficiency and safety of radioactive and hazardous material transportation packages. A more extensive review of numerical optimization and its applications to radioactive material transportation package design was performed previously by the authors (Witkowski and Harding 1992). A proof-of-concept Type B package design is also presented as a simplified example of potential improvements achievable using numerical optimization in the design process.

1227 (SAND–92-1288C) **Diagnostic behavior of the Wire Arc Plasma spray process.** Kowalsky, K.A. (Flame-Spray Industries, Inc., Stony Brook, NY (United States)); Marantz, D.R.; Neiser, R.A.; Smith, M.F. Sandia National Labs., Albuquerque, NM (United States). [1992]. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. (CONF-9206135–7: 1992 international thermal spray conference, Orlando, FL (United States), 1-5 Jun 1992). Order Number DE93000717. Source: OSTI; NTIS; GPO Dep.

Laser two-focus (L2F) velocimetry has been used to measure particle velocities in the Wire Arc Plasma spray process. Particle velocities were measured for aluminum, stainless steel, and copper feedstock with wire diameters of 1.6 mm and 0.9 mm. The Wire Arc Plasma gun was operated in both a single-gas mode, using air, and in a two-gas mode, using a mixture of argon/35% hydrogen as the primary plasma gas with pure argon as the secondary gas. The results indicate that maximum particle velocities are as high as 180 m/s for aluminum sprayed using air and 130 m/s using the argon/hydrogen mixture. The results also show that arc current and wire feed rate have little effect on particle velocity; however, particle velocities increase significantly with decreasing wire diameter and with decreasing density of the feedstock material.

1228 (SAND–92-1471C) **STACE: Source Term Analyses for Containment Evaluations of transport casks.** Seager, K.D. (Sandia National Labs., Albuquerque, NM (United States)); Gianoulakis, S.E.; Barrett, P.R.; Rashid, Y.R.; Reardon, P.C. Sandia National Labs., Albuquerque, NM (United States). [1992]. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. (CONF-920905–18: 10. international symposium on the packaging and transportation of radioactive materials: PATRAM '92, Yokohama (Japan), 13-18 Sep 1992). Order Number DE92041150. Source: OSTI; NTIS; INIS; GPO Dep.

Following the guidance of ANSI N14.5, the STACE methodology provides a technically defensible means for estimating maximum permissible leakage rates. These containment criteria attempt to reflect the true radiological hazard by performing a detailed examination of the spent fuel, CRUD, and residual contamination contributions to the releasable source term. The evaluation of the spent fuel contribution to the source term has been modeled fairly accurately using the STACE methodology. The structural model predicts the cask drop load history, the mechanical response of the fuel assembly, and the probability of cladding breach. These data are then used to predict the amount of fission gas, volatile species, and fuel fines that are releasable from the cask. There are some areas where data are sparse or lacking (e.g., the quantity and size distribution of fuel rod breaches) in which experimental validation is planned. The CRUD spallation fraction is the major area where no quantitative data has been found; therefore, this also requires experimental validation. In the interim, STACE conservatively assumes a 100% spallation fraction for computing the releasable activity. The source term methodology also conservatively assumes that there is 1 Ci of residual contamination available for release in the transport cask. However, residual contamination is still by far the smallest contributor to the source term activity.

1229 (UCRL-JC–109423) **Two-dimensional computer calculation of high-power microwave bandwidth broadening by air breakdown in a rectangular waveguide.** Mayhall, D.J.; Yee, J.H. Lawrence Livermore National Lab., CA (United States). Jun 1992. 3p. Sponsored by USDOE, Washington, DC (United States).

DOE Contract W-7405-ENG-48. (CONF-920638–1: 19. Institute of Electrical and Electronic Engineers (IEEE) international conference on plasma science, Tampa, FL (United States), 1-3 Jun 1992). Order Number DE92041083. Source: OSTI; NTIS; GPO Dep.

Extended abstract.

1230 (Y/EN–4593) **Test procedure for removal and handling of test specimens: Hollow clay tile wall test program: Revision 1.** Jones, W.D.; Hornyak, G.J. Oak Ridge Y-12 Plant, TN (United States). Jan 1992. 84p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OS21400. (HCTP–3-R1). Order Number DE92041222. Source: OSTI; NTIS; GPO Dep.

This document describes the techniques for removal and handling of five types of Hollow Clay Tile Wall (HCTW) specimens. The handling fixture required for removal of each wall specimen as shown on the procedure for that specimen is supplied by energy systems. Fixture drawing numbers are listed.

1231 (Y/EN–4729) **Inter-story drift effects on the in-plane capacity of infilled frames.** Flanagan, R.D. (Martin Marietta Energy Systems, Inc., Oak Ridge, TN (United States)); Bennett, R.M. Oak Ridge Y-12 Plant, TN (United States). 4 Aug 1992. 14p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OS21400. (CONF-9210169–1: 3. international masonry conference, London (United Kingdom), 24-31 Oct 1992). Order Number DE92041273. Source: OSTI; NTIS; GPO Dep.

The effect of out-of-plane inter-story drift on the in-plane capacity of unreinforced hollow clay tile infilled frames was evaluated by testing three large-scale specimens. Two of the specimens were first subjected to cyclic out-of-plane displacements imposed either at the top or at midheight of the infill. Little relative movement was observed between the tile infill and the bounding frame. Both specimens were then loaded in-plane to failure. The results were compared to a third identical specimen that was only loaded in-plane to failure. In-plane strength and stiffness degradation resulting from the out-of-plane drift loading was minimal. The testing is part of a comprehensive research program unreinforced masonry infill behavior that is currently investigating underway at the US Department of Energy's oak Ridge Y-12 Plant.

1232 (ANL–92/12) **Boiling heat transfer of refrigerant R-113 in a small-diameter, horizontal tube.** Wambsganss, M.W. (Argonne National Lab., IL (United States)); Jendrzejczyk, J.A.; Tran, T.N.; France, D.M. Argonne National Lab., IL (United States). Jan 1992. 39p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. Order Number DE93002351. Source: OSTI; NTIS; GPO Dep.

Results of a study of boiling heat transfer from refrigerant R-113 in a small-diameter (2.92-mm) tube are reported. Local heat transfer coefficients over a range of heat fluxes, mass fluxes, and equilibrium mass qualities were measured. The measured coefficients were used to evaluate eight different heat transfer correlations, some of which have been developed specifically for refrigerants. High heat fluxes and low flow rates are inherent in small channels, and this combination results in high boiling numbers. The high boiling number of the collected data shows that the nucleation mechanism was dominant. As a result, the two-phase correlations that predicted this dominance also predicted the data best if they also properly modeled the physical parameters. The correlations of Lazarek and Black and of Shah, as modified in this study, predicted the data very well. It is also shown that a simple form, suggested by Stephan and Abdelsalam for nucleate boiling, correlates the data equally well. This study is part of a research program in multiphase flow and heat transfer, with the overall objective of developing validated design correlations and predictive methods that will facilitate the design and optimization of compact heat exchangers for use with environmentally acceptable alternatives for chlorofluorocarbon (CFC) refrigerants and refrigerant mixtures.

1233 (DOE/ER/12820–2) **Siphon breaker design requirements: Progress report.** Neill, D.T.; Stephens, A.G. Idaho State Univ., Pocatello, ID (United States). Coll. of Engineering. [1990]. 16p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG07-88ER12820. Order Number DE93000675. Source: OSTI; NTIS; GPO Dep.

This project was intended to provide experimental data on siphon flow effects. The system was to be modeled with the RELAP code and the predicted and measured performances compared. The experimental system consists of a 500-gallon upper tank, a 4-inch downcomer pipe, a lower catch tank, a return pump and associated piping. The downcomer pipe is made of 4-inch clear acrylic pipe so the flow patterns could be observed and video taped during the test runs.

1234 (DOE/ER/12933–3) **Film boiling from spheres in single- and two-phase flow.** Liu, C.; Theofanous, T.G.; Yuen, W.W. California Univ., Santa Barbara, CA (United States). Dept. of Chemical and Nuclear Engineering. [1992]. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-90ER12933. (CONF-920804–24: American Society of Mechanical Engineers national heat transfer conference and exposition, San Diego, CA (United States), 9-12 Aug 1992). Order Number DE93000887. Source: OSTI; NTIS; INIS; GPO Dep.

Experimental data on film boiling heat transfer from single, inductively heated, spheres in single- and two-phase flow (saturated water and steam, respectively) are presented. In the single-phase-flow experiments water velocities ranged from 0.1 to 2.0 m/s; in the two-phase-flow experiments superficial water and steam velocities covered 0.1 to 0.6 m/s and 4 to 10 m/s, respectively. All experiments were run at atmospheric pressure and with sphere temperatures from 900C down to quenching. Limited interpretations of the single-phase- flow data are possible, but the two-phase-flow data are new and unique.

1235 (DOE/ER/13032–T2) **Development of an electrical impedance computed tomographic two-phase flows analyzer: Progress report for the period 1 October 1990–31 May 1992.** Jones, O.C. Rensselaer Polytechnic Inst., Troy, NY (United States). Dept. of Nuclear Engineering and Engineering Physics. 31 Mar 1992. 85p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AT06-82ER13032. Order Number DE92040527. Source: OSTI; NTIS; GPO Dep.

Description of interfacial structure and evolution, as well as the gradients which control transfer of mass, momentum, and energy at these phase boundaries is a critical challenge for the future of two-phase flow analysis. Indeed, measurement and prediction of phase boundary structure and gradients is the key element impeding development of true predictive capability for systems involving flows of liquid and vapor or gas mixtures. This report summarizes the current status of research being undertaken for the development of an electrical impedance method which can then be used for computed tomographic reconstruction of the flow field. The concept is relatively straight forward. A volume of a liquid-vapor flow is excited electrically through means of boundary electrodes. the response is measured and the internal distribution of electrical properties is determined which best matches the measured response. This is termed an "inverse problem" since it is directly inverse to the "forward problem" where the field properties and boundary conditions are known and the electrical field is computed. Since both electrical resistivity and permittivity of water and vapor are significantly different in each fluid, development of this method having sufficient rapidity will allow interfacial structure and evolution to be determined for two-phase flows. Methods for solution to this nonlinear problem are iterative in nature. A property distribution is assumed, response to the applied excitation is calculated and compared with the measured response, and calculations in the original distribution are undertaken which push the calculations in the direction of the measurements. We attempt to minimize the mean-square error between the computations and the measurements on the boundary by suitable adjustment of the internal distribution of resistivity and permittivity.

Experiments were performed on horizontal air-water bubbly two-phase flow, axial flow, stratified wavy flow, and annular flow. Theoretical studies were also undertaken on interfacial parameters for a horizontal two-phase flow. (DLC)

1237 (DOE/OR/00033–T485) **Identification of significant process variables for a flow-through supercritical water oxidation reactor.** Rossi, R.E. (Cornell Univ., Ithaca, NY (United States)). Oak Ridge Inst. for Science and Education, TN (United States); Cornell Univ., Ithaca, NY (United States). May 1992. 138p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-76OR00033. Order Number DE92041033. Source: OSTI; NTIS; INIS; GPO Dep.

The effects of four process variables on the destruction efficiency of a flow-through supercritical water oxidation reactor were investigated. These process variables included: (1) reactor throughput (GPH), (2) concentration of the surrogate waste (% acetone), (3) maximum reactor tube-wall temperature (OC), and (4) applied stoichiometric oxygen. The analysis was conducted utilizing two-level factorial experiments, steepest ascent methods, and central composite designs. This experimental protocol assures efficient experimentation and allows for an empirical response surface model of the system to be developed. This experimentation identified a significant positive effect for stoichiometric oxygen applied and temperature variations between 400 to 500°C. The increase in destruction efficiency due to stoichiometric 0_2 provides strong evidence that supercritical water oxidations are catalyzed by excess oxygen, and the strong temperature effect is a result of large increases in the kinetic rates for this temperature range. However, increasing temperature between 550 to 650°C does not provide substantial increases in destruction efficiency. In addition, destruction efficiency is significantly unproved by increasing the Reynolds number and residence time. The destruction efficiency of the reactor is also dependent upon the initial concentration of surrogate waste. This concentration dependence may indicate first-order supercritical CO kinetics is inadequate for describing all waste types and reactor configurations. Alternatively, it may indicate reactant mixing, caused by local turbulence at the oxidation fronts of these higher concentration waste streams, results in higher destruction efficiencies.

1238 (DOE/PC/79903–T18) **Optical properties of fly ash: Quarterly report, 1 Apr 1988–30 June 1988.** Self, S.A. Stanford Univ., CA (United States). High Temperature Gasdynamics Lab. Jul 1988. 30p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-87PC79903. Order Number DE93001871. Source: OSTI; NTIS; GPO Dep.

This task is planned to provide the basic optical properties data in a comprehensive and conveniently usable form. The optical constants (i.e., the components of the complex refractive index m = n - ik) of samples of synthetic slags of controlled compositions will be measured using established techniques involving transmission and surface reflectance methods. The wavelength range will extend from the visible to 12 μm and the temperature range will extend to 2000K. Initially, the optical constants of the basic calcium-aluminosilicate host glass will be determined for the composition range defined by Task 1. Subsequently, by adding infrared-active mineral oxide constituents in controlled amounts, one at a time, the modifications to m(Λ, T) produced by such constituents will be quantitatively determined. The particular constituents (and their range of mass fractions) to be examined will be determined by those disclosed by Task 1, taking account of knowledge of the optical activity at relevant wavelengths of such additions from the literature of glass technology. Specific constituents to be examined will include Fe_2O_3, taking especial account of its valence state (Fe^{2+}/Fe^{3+} ratio), and of TiO_2. The contribution of the OH radical to the optical properties will be evaluated and quantified if significant. The experimental data on m(Λ,T) as a function of composition, over the range relevant to coal ashes, will be reduced to generate simple correlation formulae. The latter will constitute the data base necessary to calculate the radiative properties of bulk slags and ash dispersions required for understanding and computing radiative transfer in coal combustion systems.

1239 (DOE/PC/91297–4) **A computational model for coal transport and combustion: Quarterly technical progress report, June 1, 1992–August 31, 1992.** Ahmadi, G. Order Number DE93000722. Source: OSTI; NTIS; GPO Dep.

Further progress has been made in formulation of the thermodynamically consistent, rate dependent model for turbulent two-phase flows. The thermodynamically admissible constitutive equations were derived, and the case of a simple shear flow was studied. The kinetic model for rapid flows of granular materials, which includes frictional losses, was used for studying gravity flow down an inclined chute. Some typical velocity profiles were obtained and the results were compared with the data of Savage. The effect of interparticle friction was also studied. Progress has been made in developing a computational model for rapid granular and two-phase flows in complex geometries. A discrete element numerical scheme was used for granular flow analysis. A predictor-corrector numerical procedure was developed for analyzing two-phase flows. Progress has been made in the construction of the experimental simple shear flow device. The design of the device was improved and its main body was assembled.

1240 (DTH-AFM–91-04) **Heat transfer research in Denmark.** Scheel Larsen, P. Danmarks Tekniske Hoejskole, Lyngby (Denmark). Afd. for Fluid Mekanik. Aug 1991. 21p. (CONF-9108222–1: 1. Baltic heat transfer conference, Goeteborg (Sweden), 26-28 Aug 1991). Order Number DE93721475. Source: OSTI; NTIS.

An overview is given of research activities in the field of heat transfer in Denmark, occasionally including mass transfer. The summary does not claim to be complete, most entries being from the university community. The survey is organized by institution, giving a statement of general activities followed by specific samples. (au) (31 refs.).

Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Obninsk (Russian Federation). Fiziko-Ehnergeticheskij Inst. 1989. 26p. (In Russian). Order Number DE93605662. Source: OSTI; NTIS (US Sales Only); INIS.

Dependences for the calculation of critical heat fluxes over the whole two-phase flow existence range in case of water supply to the tube inlet, the water being underheated to saturation temperature, are presented. The choice of the dependences, boundaries of their application is made on the basis of modern concepts of heat transfer crisis mechanism and flow conditions of the two-phase mixture. The choice of the coefficients was made with regard to processing a large amount of experimental information, accumulated in the centre of thermal physics data. 13 refs.; 7 figs.; 1 tab.

1253 (KAERI/RR–1046/91) **The thermal-hydraulic characteristics of the nuclear reactor core during accidents: Air-water flooding in multirod channels.** Cha, Jong Hee (Korea Atomic Energy Research Inst., Daeduk (Korea, Republic of)); Jeong, Moon Ki; Won, Soon Yeon; Jeon, Hyung Kil. Korea Atomic Energy Research Inst., Daeduk (Korea, Republic of). Jan 1992. 168p. (In Korean). Order Number DE93605663. Source: OSTI; NTIS (US Sales Only); INIS.

The flooding phenomena in multirod channels were investigated experimentally. The effects of spacer grids on flooding were investigated. And the mixing vane effects on flooding were investigated also. Four types of spacer grids (SSG, WSVSG, IVSG, IWSG) and blockages were used in experiment. The spacer grid decreased the critical air flow rate for flooding in compared with the case of bare rods. But the mixing vane increased air flow rate compared with SSG, IVSG had the largest mixing effects. (Author).

1254 (KAERI/RR–1062/91) **Development of test technique for thermal properties of nuclear fuels.** Kang, Young Hwan (Korea Atomic Energy Research Inst., Daeduk (Korea, Republic of)); Ryu, Woo Seog; Park, Jong Man; Choo, Kee Nam; Park, Sei Jin; Park, Jee Yoen. A sound understanding of the thermal conductivity of nuclear materials is essential both successful prediction of fuel performance such as centerline temperature, temperature gradient of fuels and behaviors of fission gas release and to evaluation of heat transfer of fuel cladding and steam generator tube to heat exchanger media. Thus, in this study apparatuses and techniques for measuring thermal conductivity are surveved and set up, and thermal conductivity of nuclear materials is produced. The results will be applied to measuring thermal conductivity for developing nuclear materials of system components as well as fuels for advanced reactors. The data-base of thermal conductivity will be a basis for improving the domestic design code of fuels and for utilizing domestic nuclear materials. (Author).

1255 (KFK–5010) **FLUTAN input specifications.** Borgwaldt, H.; Baumann, W.; Willerding, G. Kernforschungszentrum Karlsruhe GmbH (Germany). Inst. fuer Neutronenphysik und Reaktortechnik; Kernforschungszentrum Karlsruhe GmbH (Germany). Projekt Nukleare Sicherheitsforschung. May 1991. 74p. Order Number DE93720172. Source: OSTI; NTIS (US Sales Only); INIS.

FLUTAN is a highly vectorized computer code for 3-D fluiddynamic and thermal-hydraulic analyses in cartesian and cylinder coordinates. It is related to the family of COMMIX codes originally developed at Argonne National Laboratory, USA. To a large extent, FLUTAN relies on basic concepts and structures imported from COMMIX-1B and COMMIX-2 which were made available to KfK in the frame of cooperation contracts in the fast reactor safety field. While on the one hand not all features of the original COMMIX versions have been implemented in FLUTAN, the code on the other hand includes some essential innovative options like CRESOR solution algorithm, general 3-dimensional rebalacing scheme for solving the pressure equation, and LECUSSO-QUICK-FRAM techniques suitable for reducing 'numerical diffusion' in both the enthalphy and momentum equations. This report provides users with detailed input instructions, presents formulations of the various model options, and explains by means of comprehensive sample input, how to use the code. (orig.).

1256 (NEI-NO–281) **Transient simulation of 2-3D stratified and intermittent two-phase flows.** Moe, R. Oslo Univ. (Norway). Matematisk Inst. 1992 65p. Order Number DE93721637. Source: OSTI; NTIS.

The thesis consists of two papers related to different aspects of two-and three-dimensional (2-3D) simulations of separated and intermittent flows. The first paper presents the physical basis, numerical method and solution algorithm of a proposed 2-3D transient two-fluid model. The general two-fluid equations have been applied, and closure laws for wall shear stress and interfacial momentum transfer with necessary assumptions and simplifications are discussed. A single pressure field, the local velocities and the specific masses including the volumetric fraction of the two phases are solved numerically by a semi-implicit finite difference scheme. The paper also includes detailed testing, and comparisons with other models. In the second paper the derived model has been applied to verification on two-phase flow problems. Different types of interfacial friction models for stratified and intermittent flows, including an interfacial tracking scheme, have also been investigated. The model has been applied to predict Taylor bubble propagation in horizontal and inclined channels. The results have been compared to experimental data and analytical solutions. Also phenomena like slug initiations and bubble turning in downward inclined channel flow have been simulated. 35 refs., 36 figs., 3 tabs.

1257 (NEI-NO–285) **Numerical simulation of stratified flows with different k-ϵ turbulence models.** Dagestad, S. Trondheim Univ. (Norway). Norges Tekniske Hoegskole. 1991 196p. Order Number DE93721665. Source: OSTI; NTIS; INIS.

The thesis comprises the numerical simulation of stratified flows with different k-ϵ models. When using the k-ϵ model, two equations are solved to describe the turbulence. The k-equation represents the turbulent kinetic energy of the turbulence and the ϵ-equation is the turbulent dissipation. Different k-ϵ models predict stratified flows differently. The standard k-ϵ model leads to higher turbulent mixing than the low-Reynolds model does. For lower Froude numbers, F_0, this effect becomes enhanced. Buoyancy extension of the k-ϵ model also leads to less vertical mixing in cases with strong stratification. When the stratification increases, buoyancy-extension becomes larger influence. The turbulent Prandtl number effects have large impact on the transport of heat and the development of the flow. Two different formulae which express the turbulent Prandtl effects have been tested. For unstably stratified flows, the rapid mixing and three-dimensionality of the flow can in fact be computed using a k-ϵ model when buoyancy-extended is employed. The turbulent heat transfer and thus turbulent production in unstable stratified flows depends strongly upon the turbulent Prandtl number effect. The main conclusions are: Stable stratified flows should be computed with a buoyancy-extended low-Reynolds k-ϵ model; Unstable stratified flows should be computed with a buoyancy-extended standard k-ϵ model; The turbulent Prandtl number effects should be included in the computations; Buoyancy-extension has lead to more correct description of the physics for all of the investigated flows. 78 refs., 128 figs., 17 tabs.

1258 (SAND–92-0694) **SAFSIM input manual: A computer program for the engineering simulation of flow systems.** Dobranich, D. Sandia National Labs., Albuquerque, NM (United States). Sep 1992. 129p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. Order Number DE93002738. Source: OSTI; NTIS; GPO Dep.

SAFSIM (System Analysis Flow SIMulator) is a FORTRAN computer program to simulate the integrated performance of systems involving fluid mechanics, heat transfer, and reactor dynamics. SAFSIM provides sufficient versatility to allow the engineering simulation of almost any system, from a backyard sprinkler system to a clustered nuclear reactor propulsion system. In addition to versatility, speed and robustness are primary goals of SAFSIM. SAFSIM contains three basic physics modules: (1) a one-dimensional finite element fluid mechanics module with multiple flow network capability; (2) a one-dimensional finite element structure heat transfer module with multiple convection and radiation exchange surface capability; and (3) a point reactor dynamics module with reactivity feedback and decay heat capability. SAFSIM can be used for gas (compressible) or liquid (incompressible) single-phase flow systems with primary emphasis on gases (or supercritical fluids). This document contains a description of all the information required to create an input file for SAFSIM execution.

1259 (WSRC-MS–91-416) **Downward flow of water with entrained air in a nonuniformaly heated subdivided annulus.** Johnston, B.S.; May, C.P. Westinghouse Savannah River Co., Aiken, SC (United States). [1992]. 41p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. (CONF-920804–25: American Society of Mechanical Engineers national heat transfer conference and exposition, San Diego, CA (United States), 9-12 Aug 1992). Order Number DE93000593. Source: OSTI; NTIS; INIS; GPO Dep.

This paper describes an experimental study in which water was fed to a vertical annulus, entraining air in downward flow. The annulus was subdivided by longitudinal fins into four subchannels and was heated with an azimuthally varying heat flux. A bypass was provided to simulate flow in parallel channels. For steady liquid flow, inlet temperature, and pressure boundary conditions, the power was increased until critical heat flux was reached. Overheating characteristics were grouped according to the prevailing flow pattern. In annular flows ($j_L < 0.3$ m/s) overheating of the whole test section occurs when steam production causes countercurrent

flooding. In intermittent flows ($0.3 < j_L < 0.9$ m/s) the overheating is confined to a portion of the hot subchannel. The mechanism is postulated to be stagnation of a large bubble. In bubble flows ($0.9 \text{ m/s} < j_L$) overheating occurs by diverting inlet flow to the bypass and again involves the whole test section. Except at the very lowest flow rates, critical heat flux occurs when the effluent liquid temperature is below saturation.

1260 (CEA-CONF–11029) **Simulations of ultrasonic examination using focused beams properties.** Calmon, P.; Gondard, C.; Lobjois, D. CEA Centre d'Etudes de Saclay, 91 - Gif-sur-Yvette (France). Dept. de Technologie des Materiaux. 1992. 6p. (CONF-920463–: 11. international conference and exhibits on NDE in the nuclear and pressure vessel industries, Albuquerque, NM (United States), 29 Apr - 3 may 1992). Order Number DE93721149. Source: OSTI; NTIS (US Sales Only); INIS.

A simulation software based on a simplified model has been developed by the C.E.A. in order to predict the results of ultrasonic examinations. The algorithm account for the response of a crack close to the outer surface of a block examined with a focusing probe. It is based on a model described in this paper. This model allows to explain the main features observed on the echodynamic curves. Comparisons between experimental and simulated results show a quite good agreement.

1261 (CEA-CONF–11030) **Improvement of ultrasonic examination using the Spartacus system.** Benoist, P. (CEA Centre d'Etudes de Saclay, 91 - Gif-sur-Yvette (France). Dept. de Technologie des Materiaux); Chapuis, N.; Cartier, F.; Pincemaille, G.; Guenon, Y. CEA Centre d'Etudes de Saclay, 91 - Gif-sur-Yvette (France). Dept. de Technologie des Materiaux. 1992. 5p. (CONF-920463–: 11. international conference and exhibits on NDE in the nuclear and pressure vessel industries, Albuquerque, NM (United States), 29 Apr - 3 may 1992). Order Number DE93721150. Source: OSTI; NTIS (US Sales Only); INIS.

Improved computer technology and technical advances in data analysis have significantly modified the methods employed to perform ultrasonic inspections. The SPARTACUS system developed by the CEA (French Atomic Agency) in an example of this progress. The nerve center of the system is a graphic workstation. The system permits full digitization of waveform while retaining high data acquisition rates of conventional system. In addition, it enables ultra fast analysis with comprehensive interactive imaging including signal processing (filtering, correlation, deconvolution...), image processing, spectrum analysis, automatic edition of report, 3D presentation. This system is now use during In-Service Inspection with MIS (In-Service Inspection Machine). Some examples of applications are shown: improvement in sizing capabilities, examination of austenitic weldments; thickness measurement (tube applications...), automatic detection.

1262 (CEA-CONF–11031) **Improvements of the tubes ut inspection using a rotating probe and data processing.** Gondard, C. (CEA Centre d'Etudes de Saclay, 91 - Gif-sur-Yvette (France). Dept. de Technologie des Materiaux); Roy, O. CEA Centre d'Etudes de Saclay, 91 - Gif-sur-Yvette (France). Dept. de Technologie des Materiaux. 1992. 4p. (CONF-920463–: 11. international conference and exhibits on NDE in the nuclear and pressure vessel industries, Albuquerque, NM (United States), 29 Apr - 3 may 1992). Order Number DE93721151. Source: OSTI; NTIS (US Sales Only); INIS.

An ultrasonic method has been developed to test straight or bend steam generator tubes in power plant. A new type of rotating probes for cracks and wall thickness measurements have been built up and successfully tested. The data acquisition and processing system SPARTACUS is used. It allows high frequency digitalization and powerful signal processing using automatic reporting. The actual performances were tested on natural and artificial defects under representative operating conditions.

1263 (INIS-BR–2936) **Ultrasonic testing X gammagraphy.** Mello Campos, A.M. de (Companhia de Saneamento Basico do Estado de Sao Paulo (SABESP), Sao Paulo, SP (Brazil)). Instituto de Engenharia Nuclear (IEN), Rio de Janeiro, RJ (Brazil). 1989 16p. (In Portuguese). (CONF-8911264–: 9. Brazilian seminar of non destructive testing, Sao Paulo (Brazil), 5-8 Nov 1989). Order Number DE93603789. Source: OSTI; NTIS (US Sales Only); INIS.

The experience of 10 years for substituting gammagraphy tests by ultrasonic tests is related. A comparative evaluation of data obtained from both techniques applied to welded butt joints is presented. (author).

Simulated U-bend of row-1 steam generator tubings have been fabricated with draw bending technique. Eddy current signals from artificial defects on the tubings using MRPC (Motorized Rotating Pancake Coil) have been analyzed. S/N ratio of at least more than 1.5 has been obtained and the optimum frequency has been determined as 100kHz. In order to develop the EMAT (Electro-Magnetic Acoustic Transducer) equivalent circuit has been characterized and design para-meters have been determined. Elongated spiral shape EMAT's for the S-H wave generation and high energy pulse generation device made of serial capacitors and SCR have been fabricated. A computer program for reconstruction of signal amplitudes using SAFT (Synthetic Aperture Focusing Technique) algorithm has been developed. The results of data processing with SAFT method have shown greatly improved S/N ratio. (Author).

1265 (ORNL/ATD–64) **Hydrostatic pressure testing of graphite/epoxy cylinder C6-1.** Blake, H.W.; Starbuck, J.M. Oak Ridge National Lab., TN (United States). Applied Technology Div. Jul 1992. 127p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE93000427. Source: OSTI; NTIS; GPO Dep.

This report details the design, fabrication, and testing of IM6 graphite cylinder C6-1, which achieved a record pressure in hydrotest without failure. Included are the details of the cylinder construction, the design calculations for stress and buckling, and the cylinder failure predictions. Also provided are the design details of the metal end closures including the design calculations for the linear tapered end plugs. Finally, the test data and observations from the hydrotest are summarized. This work is performed under the Oak Ridge National Laboratory, Laboratory Directed Research and Development Program. The project is funded by the Director as a three-year project.

1266 (SA-FOU–91-01) **A procedure for safety assessment of components with cracks - Handbook.** Bergman, M.; Brickstad, B.; Dahlberg, L.; Nilsson, F.; Sattari-Far, I. Swedish Plant Inspectorate, Stockholm (Sweden). Dec 1991. 89p. Order Number DE93603790. Source: OSTI; NTIS; INIS.

A procedure for assessment of components with cracks or crack like defects is described in this handbook. The procedure can be used to decide if a certain defect can cause fracture of a component or otherwise be judged detrimental to the safety of the component. It is assumed in the method that the shape and the size of the considered defect are defined. The defect can be an actually existing one or a hypothetical one in connection with damage tolerance assessments. The procedure can be used to estimate: a; The load carrying capacity of the component with consideration of the assumed defect, or b; The maximal crack size that does not cause fracture for the assumed loading conditions. The assessments described under a and b can be performed with or without consideration of safety margins. A system for safety margins is outlined. For application to components in nuclear power facilities numerical values of the safety factors are given. The method that is utilized in this procedure is based on the R6-method, developed at CEGB. The basic assumption is that fracture initiated by a crack can be described by the variables K_R and L_R.

K_R is the ratio between the elastically calculated stress intensity factor and the fracture toughness of the material. L_R is the ratio between applied load and the plastic limit load of the structure. The method can in principal be used for all metallic materials where the material properties σ_Y and K_{cr} can be defined. It is, however, more extensively verified only for steel alloys. The method is not intended for use at so high temperatures that creep deformation is of importance. A computer program written in FORTRAN 77 has been developed which is capable of performing the calculations described in this document.

1267 **Sealing system for a sealed bearing assembly used in earth drilling.** Wenzel, K.H.; Foote, D. 11 Jul 1992. Filed date 8 Jan 1991. Canada Patent patent application 2033779. 24p. Source: Micromedia Ltd., Technical Information Centre, 165 Hotel de Ville, Place du Portage, Phase 2, Hull, Quebec, Canada J8X 3X2. Prices: PC $6.00 CAN; MF $4.00 CAN.

An improved sealing system for a sealed bearing assembly used in downhole motor systems for earth drilling is disclosed. The bearing assembly has a first tubular member, and a second tubular member telescopically received in the first member. The second member has an interior passage through which drilling fluids pass under pressure from on-surface pumps. A clearance space is provided between the first and second tubular members defining a lubricant-filled bearing chamber. The improvement of the invention is in the seal at a pump end of the bearing chamber which consists of a first floating piston, a second floating piston spaced from the first, and a fixed seal intermediate the first and second floating pistons. A first chamber filled with lubricant is provided between the first floating piston and the fixed seal. A second chamber is provided between the fixed seal and the second floating piston. The chamber has a passage to a location external of the first tubular member. The differential in pressure between the first and second chambers is sealed by the fixed seal. The system of the invention provides a means for balancing, insofar as possible, the pressures exerted upon individual seals while providing backup seals in the event of seal failure, thereby prolonging the useful life of the bearing assemblies. 3 figs.

1268 (NEI-NO–277) **Methods for design and analysis of flexible risers.** Soedahl, N. Trondheim Univ. (Norway). Norges Tekniske Hoegskole. 1991 214p. Order Number DE93721627. Source: OSTI; NTIS.

The main purpose of this work is to improve existing methods for practical design and analysis of flexible pipes used as fully dynamic risers in floating production systems and contribute to a better understanding of the static and dynamic behavior of flexible risers. The design analysis today are often carried out by stochastic time domain simulations for a given short-term environmental condition by use of the finite element method. The responses of flexible risers are known to be non-Gaussian due to the non-linearities introduced by the hydrodynamic loading and the stiffness properties of the pipe. Rather long simulations will therefore be needed to give a proper statistical response description. An efficient method for including bending stiffeners in the design analyses is presented by splitting the complete system into a local quasi-static response model for the bending stiffener analysed by a shooting technique and a global response model to account for the global dynamic behavior. Several case studies have been carried out to verify the accuracy and computational benefit of the proposed approach. A major part of this study has been concerned with extreme value estimation of non-Gaussian respones by fitting a proposed distribution model to a simulated sample of response maxima or response extremes by use of moment-based estimators. The validity of the proposed methods for extreme value estimation and quantification of statistical uncertainties has been investigated by a case study of a steep wave configuration. It is concluded that the derived expressions give a good description of the statistical uncertainty for extreme values estimated by use of the Weibull and the Weibull-tail distributions. 80 refs., 78 figs., 12 tabs.

1269 **Protective system against icebergs or floating objects.** Mogridge, G.R.; Funke, E.R. 13 Jun 1992. Filed date 12 Dec 1990. Canada Patent patent application 2032096. 13p. Source: Micromedia Ltd., Technical Information Centre, 165 Hotel de Ville, Place du Portage, Phase 2, Hull, Quebec, Canada J8X 3X2. Prices: PC $6.00 CAN; MF $4.00 CAN.

An offshore area such as an oil production platform and associated submarine or floating installations can be protected from drifting icebergs by the use of a system that absorbs the kinetic energy of the object by submerging a buoyant member or members attached to mooring lines anchored to the sea bed in a particular arrangement as described. The system of the invention comprises at least one buoyant member providing a predetermined upward buoyant force upon submergence; and a mooring line attached to each buoyant member and anchored to the sea bed at a position spaced away from the area to be protected. The mooring line has a length sufficient to allow contact of the floating object with the buoyant member or mooring line, and having a length limited to provide travel constraints on the travel path of the buoyant member such that lateral displacement of the line effects downward travel of the buoyant member. The values of the buoyancy force upon submergence and available submergence distance of the buoyant member upon collision with the floating object are selected such that the product of the force and distance equals a value corresponding to a selected portion of the kinetic energy of a predetermined floating object against which protection is desired. 3 figs.

1270 (BARC–1992/E/005) **Computer control of pulsed tunable dye lasers.** Thattey, S.S. (Bhabha Atomic Research Centre, Bombay (India). Multidisciplinary Research Section); Dongare, A.S.; Suri, B.M.; Nair, L.G. Bhabha Atomic Research Centre, Bombay (India). 1992. 25p. Order Number DE93605896. Source: OSTI; NTIS (US Sales Only); INIS.

Pulsed tunable dye lasers are being used extensively for spectroscopic and photo-chemical experiments, and a system for acquisition and spectral analysis of a volume of data generated will be quite useful. The development of a system for wavelength tuning and control of tunable dye lasers and an acquisition system for spectral data generated in experiments with these lasers are described. With this system, it is possible to control the tuning of three lasers, and acquire data in four channels, simultaneously. It is possible to arrive at the desired dye laser wavelength with a reproducibility of $\pm$ 0.012 cm^{-1}, which is within the absorption width (atomic interaction) caused by pulsed dye lasers of linewidth 0.08 cm^{-1}. The spectroscopic data generated can be analyzed for spectral identification within absolute accuracy $\pm$ 0.012 cm^{-1}. (author). 6 refs., 11 figs.

1271 (CEA-CONF–10977) **A two-frequency Wiggler for a better control of a free-electron-laser dynamics.** Iracane, D.; Bamas, P. CEA Centre d'Etudes de Bruyeres-le-Chatel, 91 (France). 1991. 12p. (CONF-9108118–49: 13. international free-electron laser (FEL) conference, Santa Fe, NM (United States), 25-30 Aug 1991). Order Number DE93721371. Source: OSTI; NTIS (US Sales Only).

In the paper is studied the physics of a free electron laser (FEL) based on a two-frequency undulator (TFU) which induces large non linear effects, especially on the spectral dynamics. These effects are analyzed in an extended formalism where the spontaneous emission, the low-gain regime and the strong-field saturation regime are studied. Numerical simulations show that the optimized

TFU generates a laser field having both a large extraction efficiency and a narrow spectrum.

1272 (DOE/ET/29239–T1) **A basic study of the aging process in solid dielectric cables, Part 1: First annual report, September 29, 1977–October 31, 1978.** Derringer, G.C.; Epstein, M.M.; Gaines, G.B.; Luttinger, M.; McGinniss, V.D.; Thomas, R.E. Battelle Columbus Labs., OH (United States). Nov 1979. 132p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC01-77ET29239. Order Number DE92019747. Source: OSTI; NTIS; GPO Dep.

The Department of Energy, Electrical Energy Systems Division, has initiated a 4-year study concerned with the aging of extruded power transmission cables. The program has two principal objectives: (1) develop a basic understanding of the physical mechanisms of dielectric aging and failures, and (2) develop a nondestructive, accelerated test for predicting the service life of these cables. The program is devoted exclusively to the most widely used solid dielectrics, viz. low density polyethylene, crosslinked polyethylene, and ethylene propylene rubber. For purposes of this program, it is assumed that the cable will be isolated from the external environment during service. The program consists of four sequential tasks, the first two of which are completed. The results of these first two tasks are described in this report. The report also contains an overview of preliminary plans for the third task, a comprehensive experimental program.

1275 (NEI-NO–284) **Development and control of a resonant dc-link converter for multiple motor drives.** Petterteig, A. Trondheim Univ. (Norway). Norges Tekniske Hoegskole. 1992 217p. Order Number DE93721664. Source: OSTI; NTIS.

This thesis consists of two main parts. In the first part the general resonant dc-link theory, control concepts, and different converter types are presented. The proposed resonant dc-link concept of this work is introduced, as well as its control and some reasons for choosing it. The idea is to use one passively clamped oscillating link with several converters connected. A power circuit simulation program is used for analyzing three passively clamped converters. Finally, the realization of one resonant dc-link converter, and measurements done in the laboratory are described. The second part of the thesis introduces the Insulated Gate Bipolar Transistor (IGBT), which is an important component in this work. The IGBT is a relatively new power transistor. It has found its application field in the voltage range above 300 V dc and the current range above 50 A. 47 refs., 126 figs., 16 tabs.

1276 (SAND–92-0462C) **The use of the charge-induced voltage alteration technique to analyze precursors to dielectric breakdown.** Barton, D.L.; Cole, E.I. Jr. Sandia National Labs., Albuquerque, NM (United States). [1992]. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. (CONF-920971–1: Microelectronic processing, San Jose, CA (United States), 21-25 Sep 1992). Order Number DE92040960. Source: OSTI; NTIS; GPO Dep.

Charge-Induced Voltage Alteration (CIVA) is a new scanning electron microscopy technique to rapidly localize open conductors on integrated circuits (ICs). CIVA uses a constant current source to power the IC under test and produces an image by monitoring the variation in voltage supplied to the IC as a function of electron beam position. This concept of observing supply voltage changes as in CIVA has been applied to Tunneling Current Microscopy (TCM). TCM has been used to localize oxide defects in biased, large area MOS capacitors before oxide breakdown by measuring the fluctuations in current with electron beam position. These changes are normally on the order of 10 nA. Conventional current amplifiers normally limit the applied voltage thereby reducing the operational range of the TCM technique unless special circuit modifications are employed. By using a constant current source and monitoring the voltage changes across the capacitor being analyzed, there are no voltage limitations. Signal magnitudes on the order of 5 mV have been recorded from capacitor defects using the CIVA setup. A detailed description of the CIVA acquisition system used for TCM and a comparison with conventional TCM are provided. Images of oxide defects before breakdown are presented to show that, while the two approaches are comparable wid each has its own strengths and weaknesses, the CIVA approach is a superior technique for precursor localization.

1277 (SAND–92-0650C) **Integrated test and package methods for integrated photonics.** Carson, R.F.; Kravitz, S.H.; Hietala, V.M.; Harff, N.E.; Armendariz, M.G.; Vawter, G.A. Sandia National Labs., Albuquerque, NM (United States). [1992]. 13p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. (CONF-9209184–4: The International Society for Optical Engineering (SPIE) meeting, Boston, MA (United States), 8-11 Sep 1992). Order Number DE93000748. Source: OSTI; NTIS; GPO Dep.

Arrangements of discrete photonic waveguide devices are currently being integrated to form circuits. These Photonic Integrated Circuits (PICS) require test methods that are adaptable as circuit size and complexity grows. Here, we describe tests used to characterize a GaAs/GaAlAs waveguide-based PIC being developed for phase-shift control in phased-array antenna applications. The various elements of the PIC include digital and analog waveguide modulators, light-guide splitters and combiners, turning mirrors, and input-output polarization-maintaining single-mode optical fibers. These basic elements are combined to perform higher-order functions such as optical frequency translation (single side-band suppressed carrier modulation), and phase shifting on multiple optical taps. Tests used to characterize the elements include optical loss, guided-wave modal characteristics, antireflection coating effectiveness, electro-optical (phase) modulation efficiency, electrical frequency response, and optical frequency translation. These tests are integrated with the fiber attachment and RF packaging sequence to construct working device prototypes. They are currently being applied to discrete components of the circuit, and will be adapted as the various parts are integrated.

1278 (SAND–92-1171C) **Photoconductive semiconductor switches for high power radiation.** Loubriel, G.M. (Sandia National Labs., Albuquerque, NM (United States)); Zutavern, F.J.; Denison, G.J.; Helgeson, W.D.; McLaughlin, D.L.; O'Malley, M.W.; Demarest, J.A. Sandia National Labs., Albuquerque, NM (United States). [1992]. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. (CONF-9210166–1: 4. international conference on ultra-wideband, short-pulse electromagnetics, Brooklyn, NY (United States), 8-10 Oct 1992). Order Number DE92040968. Source: OSTI; NTIS; GPO Dep.

In this paper we present the results of experiments on Si and GaAs Photoconductive Semiconductor Switches (PCSS). Our goal is to improve their performance for high power electromagnetic pulse generation. For Si, we show ways to alter carrier lifetime

achieve higher repetition rates, improvements in switch lifetimes to over 10^7 pulses at high field, and methods that reduce or eliminate thermal runaway and heating. For GaAs, the effects of focused trigger radiation was studied and a further reduction (by a factor of 100) in the required light energy was observed. The gain in these switches is now about 100,000 electrons generated per absorbed or trigger photon. It was further demonstrated that light can be piped through fiber optics to trigger multiple current filaments in GaAs. These results show the ability to control the location of the current filaments.

1279 (SAND–92-1793C) **High efficiency UHF oscillator for portable battery-powered applications.** Wessendorf, K.O. Sandia National Labs., Albuquerque, NM (United States). [1992]. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. (CONF-9209232–1: 14. piezoelectric devices conference, Kansas City, MO (United States), 15-17 Sep 1992). Order Number DE92040961. Source: OSTI; NTIS; GPO Dep.

There is a growing demand for high-frequency circuit designs which are capable of being used in portable battery-powered applications. This type of environment typically requires circuits designed for small size and minimum dc current draw. A transponder design at Sandia National Laboratories required a 430 MHz oscillator (crystal controlled) which could run off a 3 V lithium battery and have an output power of approximately 0 dbm and draw the least possible dc current (less than 4 mA was desired). Physically the oscillator height has to be less than 0.1 in^2 and occupy less than 1 in^2 surface area. Another requirement, for the first engineering prototype, was that the oscillator be made out of inexpensive, standard parts. The design was integrated onto a circuit board with the associated transponder circuitry. This paper describes a technique to make a high-efficiency 430 HHz oscillator which demonstrates efficiencies in the 10% to 12% range for an output of approximately 0 dbm. Data will show the frequency spectrum of the oscillator waveform and the performance of the oscillator over temperature and power supply voltage. To meet the requirements and make the design as simple as possible a 107.5 MHz (R_m < 70 ohms) Statek AT-Strip resonator was chosen. This resonator was chosen because of its small size, surface mountability, and good electrical performance. This resonator was used at series resonance in an oscillator multiplier circuit which would provide a (4X) multiplication in an efficient manner. The oscillator (first stage) is a Butler Oscillator-Multiplier (2X) which is direct coupled to a buffer transistor (second stage) and harmonic generating (2X) transistor which share bias current. The final design delivers 1 dbm at 3 V with 3.33 mA current draw. All harmonics and subharmonics are > 20 db down from the desired frequency.

1280 (SAND–92-1877C) **Revised nomenclature for defects at or near the Si/SiO_2 interface.** Fleetwood, D.M. Sandia National Labs., Albuquerque, NM (United States). [1992]. 3p. (CONF-921226–3: 1992 Institute of Electrical and Electronic Engineers (IEEE) semiconductor interface specialists conference, San Diego, CA (United States), 9-13 Dec 1992). Order Number DE92040975. Source: OSTI; NTIS; GPO Dep.

A revised nomenclature for defects in MOS devices is described which clearly distinguishes the language used to describe the physical location of defects from that used to describe their electrical response. "Oxide traps" are simply defects in the SiO_2 layer, and "interface traps" are defects at the Si/SiO_2 interface; nothing is presumed about how either communicates with the underlying Si. "Fixed states" are defined electrically as trap levels that do not communicate with the Si on the time scale, but "switching states" can exchange charge with the Si. Fixed states presumably are oxide traps, but switching states can either be interface traps or near-interfacial oxide traps that can communicate with the Si, i.e. "border traps." Thus the term "traps" is reserved for defect location, and the term "states" for electrical response. This defect picture is used to provide new insight into the response of MOS capacitors with 45-nm radiation-hardened oxides to electrical stress and annealing; capacitance-voltage and thermally-stimulated-current measurements are used. 2 figs, 14 refs. (DLC)

1281 (SAND–92-1920C) **Effect of oxide thickness on interface-trap buildup rates.** Shaneyfelt, M.R.; Schwank, J.R.; Fleetwood, D.M.; Winokur, P.S. Sandia National Labs., Albuquerque, NM (United States). [1992]. 3p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. (CONF-921226–1: 1992 Institute of Electrical and Electronic Engineers (IEEE) semiconductor interface specialists conference, San Diego, CA (United States), 9-13 Dec 1992). Order Number DE92040981. Source: OSTI; NTIS; GPO Dep.

The time dependence of radiation-induced interface-trap charge buildup for MOS transistors of varying gate-oxide thickness was investigated in order to clarify how the location of hydrogen in the SiO_2 contributes to N_{it} buildup. Radiation-induced interface-trap buildup in wet and dry gate oxides is compared for irradiations and anneals at constant positive bias and for negative-bias irradiations followed by positive-bias anneals. Implications of these results for different models of interface-trap buildup are discussed. 2 figs, 9 refs. (DLC)

1282 (UCRL-JC–111062) **Time stability of Monte Carlo device simulation: [Extended abstract].** Rambo, P.W.; Denavit, J. Lawrence Livermore National Lab., CA (United States). 29 Jun 1992. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-921204–1: International electron devices meeting, San Francisco, CA (United States), 6-9 Dec 1992). Order Number DE92019375. Source: OSTI; NTIS; GPO Dep.

We present stability analysis applicable to several algorithms used for solid state simulation including an algorithm described by Hackney. An approximate expression for the growth rate, valid for $\omega_p\Delta t<1$ and $\nu_c/\omega_p<1$, is given, by $\gamma\Delta t\approx(\omega_p\Delta t)^2/4-(\nu_c\Delta t)/2$ where ν_c is the momentum transfer collision rate. In the absence of collisions, the interesting result is found that instability occurs for all values of $\omega_p\Delta t$. In practice, collisions allow stable simulation provided $\omega_p\Delta t$ is sufficiently small.

1283 **Method of increasing the efficiency of an electrical generator (combination SIis/E-SIis).** Szabo, L.I. To Electro Erg Ltd. (Hungary). 16 Jul 1992. Filed date 15 Jan 1991. Canada Patent patent application 2034163. 34p. Source: Micromedia Ltd., Technical Information Centre, 165 Hotel de Ville, Place du Portage, Phase 2, Hull, Quebec, Canada J8X 3X2. Prices: PC $6.00 CAN; MF $4.00 CAN.

A method is disclosed for increasing the efficiency of an electrical generator of the type that generates real output power by a change of the reluctance of the magnetic flux path. The method comprises providing the following components, features, and characteristics of the generator according to a specified formula. The number of turns (N1) of excitation coils of an excitation circuit around the magnetic flux path, the number of turns (N2) of load coils around the magnetic flux path, the number of poles (p) of the reluctance-changing part, the rpm (n) of the reluctance-changing part, the average reluctance of the magnetic flux path (Ra), and the amplitude of change (Rc) of the reluctance of the magnetic flux path are provided in a combination so as to reduce the relative effect of a load (RL ohms) in the load coil according to the equation $[(N1/N2)lex]/[(1/Ra)+(jRL/wN2^2)]$ where $w=2\pi np/60$ and lex is the excitation current. Further aspects of the invention reside in providing methods and means of reducing the effect of the alternating current which is superimposed on the excitation coil, and in providing an electrical generator without a rotor or other moving part of the magnetic flux path of the generator by which the reluctance is changed. 10 figs.

1284 **Method of increasing the efficiency of an electrical generator (SLIS).** Szabo, L.I. To Electro Erg Ltd. (Hungary). 22 Jun 1992. Filed date 21 Dec 1990. Canada Patent patent application 2033013. 18p. Source: Micromedia Ltd., Technical Information Centre, 165 Hotel de Ville, Place du Portage, Phase 2, Hull, Quebec, Canada J8X 3X2. 1285 (ANL/CP–77442) **Design and modeling of superconducting RFQ structures.** Delayen, J.R.; Kennedy, W.L. Argonne National Lab., IL (United States). [1992]. 3p. Sponsored by USDOE, Washington, DC (United States); Department of Defense, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-9208109–65: 16. international LINAC conference, Ottawa (Canada), 23-28 Aug 1992). Order Number DE93000511. Source: OSTI; NTIS; GPO Dep.

Tests of the first superconducting RFQ structure indicated that high surface electric fields could be sustained in a quadrupole geometry. However, the geometry used in those tests was not appropriate for an accelerating structure and the area sustaining the high electric field was too small to assume that such fields could be achieved in actual RFQ structures. We have initiated a program to analyze and model a variety of geometries suitable for superconducting RFQ structures. We are also designing a niobium RFQ "sparker" to experimentally measure the surface electric fields that can be achieved on large areas in an actual RFQ structure.

1287 (KAERI/RR–1081/91) **A study on the proton beam irradiation effect in zircaloy using cyclotron.** Han, Jung Ho (Korea Atomic Energy Research Inst., Daeduk (Korea, Republic of)); Rheem, Karp Soon; Kim, Young Suk; No, Gae Ho; Jeong, Yong Hwan; Park, Ji Yun; Lee, Duk Hyun; Park, Gi Sung. Korea Atomic Energy Research Inst., Daeduk (Korea, Republic of). Feb 1992. 88p. (In Korean). Order Number DE93605683. Source: OSTI; NTIS (US Sales Only); INIS.

The purpose of this study is to analyze the characteristics of ion beam irradiated zircaloy. The comparison of the characteristic between neutron and ion beam irradiation, and the investigation of the phase transformation mechanism in precipitate of zircaloy are also included for the evaluation of fuel cladding integrity. The results obtained from this study are as follows : (1) Basic studies were performed on the characteristics and correlation between neutron and charged particle irradiation. Amorphization of precipitates under the different types of irradiation was characterized. (2) The microstructural evalution of the unirradiated and proton beam irradiated zircaloy-4 sheet was analyzed. (3) Optimization of proton beam irradiation condition for zircaloy was established by TRIM code. (Author).

1288 (LBL–32734) **Electron beam transport for the LBL IR-FEL.** Staples, J.; Edighoffer, J.; Kim, Kwang-Je. Lawrence Berkeley Lab., CA (United States). Jul 1992. 3p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00098. (CONF-9208109–55: 16. international LINAC conference, Ottawa (Canada), 23-28 Aug 1992). Order Number DE93000572. Source: OSTI; NTIS; GPO Dep.

The infrared flee-electron laser (IR-FEL) proposed by LBL as part of the Combustion Dynamics Research Laboratory (CDRL) consists of a multiple-pass accelerator with superconducting cavities supplying a 55 MeV 12 mA beam to an undulator within a 24-meter optical cavity. Future options include deceleration through the same cavities for energy recovery and reducing the power in the beam dump. The electron transport system from the injector through the cavities and undulator must satisfy conditions of high order achromaticity, isochronicity, unity first-order transport matrix around the recirculation loop, variable betatron match into the undulator, ease of operation and economical implementation. This paper presents a workable solution that satisfies these requirements.

The Argonne Wakefield Accelerator (AWA) is an experiment designed to test various ideas related to wakefield technology. Construction is now underway for a 100 nC electron beam in December of 1992. This report updates this progress.

1290 (BNL–47856) **Summary of the linac based radiation sources working group.** Ben-Zvi, I.; Corbett, J.; Johnson, E.; Kim, K.J.; Sheffield, R. Brookhaven National Lab., Upton, NY (United States). [1992]. 22p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016. (CONF-9202111–7: 4. generation light sources workshop, Stanford, CA (United States), 24-27 Feb 1992). Order Number DE92041316. Source: OSTI; NTIS; GPO Dep.

Technological advances have occurred in the past few years that have made linac based Free-Electron Lasers (FEL) promising candidates for the generation of short wavelength radiation. Although the FELs use undulators or wigglers, they produce stimulated radiation rather than the spontaneous emission found in insertion devices on the second and third generation sources of today. This stimulated emission process endows the FEL with properties presenting unique opportunities in many fields of science. Among these characteristics are: coherence, spectral brightness, peak power,high average power. Additional scope for experimental growth is provided by the flexible pulse structure of linac based sources, making possible developments in high resolution timing experiments. Invited presentations to the working group on linac based radiation sources covered various key subjects, aiming at establishing the ground work for various machine designs. Design issues of FEL light sources were worked out in a few sessions, including sub-group sessions. We have also discussed the question of R&D necessary for the development of high quality FEL light sources. A high priority was placed on laser photocathode rf gun development, emittance preservation and FEL mechanism studies. This report describes the technological foundation for high brightness beams, the design of FELs using these beams and recommendations for research and development in FEL physics.

1291 (BNL–47857) **A proposed experiment for beam conditioning.** Ben-Zvi, I. (Brookhaven National Lab., Upton, NY (United States)); Yu, L.H.; Govil, R.; Sessler, A.M. Brookhaven National Lab., Upton, NY (United States). [1992]. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016. (CONF-9208142–4: 14. international free electron laser conference, Kobe (Japan), 23-28 Aug 1992). Order Number DE92041315. Source: OSTI; NTIS; INIS; GPO Dep.

An experiment on beam conditioning (1) is proposed for the Accelerator Test Facility (ATF) at Brookhaven National Laboratory. The proposed demonstration will employ the already approved Harmonic Generation FEL (2) experiment (HGFEL) at the facility. The HGFEL experiment will use a 30 MeV electron beam from the ATF and a seed laser to produce a 3.4 micron radiation from a

superconducting wiggler with a 1.8 cm period. In the proposed experiment, the beam energy is reduced to 17 MeV, and only the second wiggler of the HGFEL is employed. Resonance is made at 10.6 microns. The demonstration involves spoiling the emittance to drastically reduce the output power. A beam conditioning section introduces momentum variations correlated with betatron amplitude. This correlation will correct the deleterious effects of the artificially introduced emittance increase thus providing a clear demonstration of the conditioner.

1292 (BNL–47909) **Operation of the Brookhaven National Laboratory Accelerator Test Facility.** Batchelor, K.; Ben-Zvi, I.; Botke, I.; Chou, T.S.; Fernow, R.; Fischer, J.; Fisher, A.; Gallardo, J.; Ingold, G.; Malone, R.; Palmer, R.; Parsa, Z.; Pogorelsky, I.; Rogers, J.; Sheehan, J.; Srinivasan-Rao, T.; Tsang, T.; Ulc, S.; van Steenbergen, A.; Wang,Brookhaven National Lab., Upton, NY (United States). [1992]. 3p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016. (CONF-9208109–56: 16. international LINAC conference, Ottawa (Canada), 23-28 Aug 1992). Order Number DE93000372. Source: OSTI; NTIS; INIS; GPO Dep.

Early operation of the 50 MeV high brightness electron linac of the Accelerator Test Facility is described along with experimental data. This facility is designed to study new linear acceleration techniques and new radiation sources based on linacs in combination with free electron lasers. The accelerator utilizes a photo-excited, metal cathode, radio frequency electron gun followed by two travelling wave accelerating sections and an Experimental Hall for the study program.

1293 (CEA-LNS-GT–92-05) **The future machine with electrons of 15-30 GeV.** Tkatchenko, A. Laboratoire National Saturne, Centre d'Etudes de Saclay, 91 - Gif-sur-Yvette (France). 1992. 8p. (In French). (CONF-9205256–: 6th SATURNE days, Mont Sainte-Odile (France), 18-22 May 1992). Order Number DE93720980. Source: OSTI; NTIS (US Sales Only); INIS.

This article presents the project of european linear accelerator with a continuous beam of high energy electrons for the Nuclear Physics researches. Based on a superconducting linear accelerator crossed several times, this machine will be able to produce beams of 15 GeV in a first time, then 30 GeV, by increasing of accelerator cavity field without modifying the beam circulation system.

1294 (CRN-VIV–96) **Vivitron - Progress report 1990.** Strasbourg-1 Univ., 67 (France). Centre de Recherches Nucleaires. 1991. 57p. (In French). Order Number DE93721000. Source: OSTI; NTIS (US Sales Only); INIS.

The 1990 activity report of the Strasbourg Nuclear Research, concerning the Vivitron project, is presented. After having mounted all the Van de Graaff elements of the Vivitron needed for the generator tests, the tank was closed in July 1990. It was then put under vacuum, leaks were searched for and repaired. Voltage tests started in December and a voltage of 17.6 MV was reached in February. Modifications on the charging system and to improvement of the column protection against sparks are necessary before the voltage tests can be carried on. Great progress has been made in the setting up of the new Vivitron injector and analysing magnet. In this report are included the description of project different development steps, the Vivitron budget and the list of publications, congress contributions and internal reports. 18 figs.

1295 (DOE/ER/40669–2) **Inverse Free Electron Laser beat-wave accelerator research: Annual progress report.** Marshall, T.C.; Bhattacharjee, A. Columbia Univ., New York, NY (United States). Aug 1992. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-91ER40669. Order Number DE93002770. Source: OSTI; NTIS; INIS; GPO Dep.

In the past twelve-month period, we have completed our experimental study of the inverse-FEL autoaccelerator. The IFEL accelerates electrons by stimulated absorption of a laser pulse passing along an electron beam in an undulator; the autoaccelerator is a configuration we have developed at Columbia to test the principle of resonant absorption and acceleration. This report discusses the progress of this research.

1296 (KAERI/RR–1074/91) **Studies on the improvement of irradiation process.** Kim, Ki Yup (Korea Atomic Energy Research Inst., Daeduk (Korea, Republic of)); Pyun, Hyung Chick; Yoon, Byung Mok; Nho, Young Chang; Lee, Young Keun; Park, Soon Chul; Na, Bong Joo; Yoo, Young Soo. Korea Atomic Energy Research Inst., Daeduk (Korea, Republic of). Jan 1991. 94p. (In Korean). Order Number DE93605685. Source: OSTI; NTIS (US Sales Only); INIS.

On the basis of analysis and examination for efficient maintenance and operation of the facility, the method of improving irradiation process was discussed so that we may extend the applicability of irradiation technique to various materials and accelerate nation-wide propagation of radiation processing technology. Preparations have been made for transfer, installation, and operation of the irradiation facilities in radiation application building which will be completed at the headquarter site by the end of 1992. The qualification testing apparatus for nuclear power station cables was conceptually designed to investigate the degradation behavior of the cables under a simulated LOCA(Loss of Coolant Accident) environments. (Author).

1297 (LA-UR–92-2968) **Superconducting RFQ development at Los Alamos.** Wangler, T.P.; Cimabue, A.; Merson, J.; Mills, R.S.; Wood, R.; Young, L. Los Alamos National Lab., NM (United States). [1992]. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-9208109–53: 16. international LINAC conference, Ottawa (Canada), 23-28 Aug 1992). Order Number DE93000688. Source: OSTI; NTIS; GPO Dep.

We are investigating the performance capabilities of a niobium, superconducting, radiofrequency-quadrupole (RFQ) accelerator for high- field continuous-wave operation, to provide greater acceleration and stronger focusing of low-velocity ion beams. We present the results of our RFQ beam-dynamics studies, which test new design methods for increasing the beam transmission, our cavity-design calculations, and some mechanical-design aspects of a short, superconducting RFQ 4-vane prototype structure that will be tested at high fields during the coming year.

1298 (LA-UR–92-3215) **Photocathode electron linac for AFEL.** Wood, R.L.; Young, L.M.; Aikin, D.J.; Clark, W.L.; DePaula, R.F.; Gladwell, C.; Ledford, J.E.; Martinez, F.A.; Stovall, J.E. Los Alamos National Lab., NM (United States). [1992]. 20p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-921116–2: 12. international conference on the application of accelerators in research and industry, Denton, TX (United States), 2-5 Nov 1992). Order Number DE93000875. Source: OSTI; NTIS; INIS; GPO Dep.

A compact, high brightness accelerator was designed and fabricated by Los Alamos National Laboratory for use in the Advanced Free Electron Laser facility. A brazed copper, 1300 MHz, 20 MeV structure is suspended within a thermally insulating vacuum vessel. Integral cooling passages allow introduction of cooling water for normal operation, or liquid nitrogen for cryogenic operation. Its exceptional beam quality is expected to enhance the performance of the FEL experiments planned for the AFEL facility.

1299 (LBL–32250) **Asymmetric PHI factories: A proposed experiment and its technical feasibility.** Eberhard, P.; Chattopadhyay, S. Lawrence Berkeley Lab., CA (United States). Jul 1992. 3p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00098. (ESG–178;CONF-920706–35: International conference on high energy accelerators, Hamburg (Germany), 20-24 Jul 1992). Order Number DE93000579. Source: OSTI; NTIS; INIS; GPO Dep.

We discuss an experiments nd the technical feasibility of the required asymmetric ϕ-factory to test nonlocal quantum mechanics in kaon systems.

1300 (LBL-PUB–3104) **ALS beamlines for independent investigators: A summary of the capabilities and characteristics of beamlines at the ALS.** Lawrence Berkeley Lab., CA (United States). Aug 1992. 52p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00098. Order Number DE93000629. Source: OSTI; NTIS; INIS; GPO Dep.

There are two mods of conducting research at the ALS: To work as a member of a participating research team (PRT). To work as a member of a participating research team (PRT); to work as an independent investigator; PRTs are responsible for building beamlines, end stations, and, in some cases, insertion devices. Thus, PRT members have privileged access to the ALS. Independent investigators will use beamline facilities made available by PRTs. The purpose of this handbook is to describe these facilities.

1301 (SSCL–582) **Kinematic analysis of Six Strut Support System for super collider components.** Weaver, C.D. (San Diego State Univ., CA (United States). Dept. of Mechanical Engineering). Superconducting Super Collider Lab., Dallas, TX (United States). Aug 1992. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC35-89ER40486. Order Number DE93002183. Source: OSTI; NTIS; INIS; GPO Dep.

The Superconducting Super Collider will contain two proton beams accelerated to successively higher energies through a series of four boosters. Synchronized r-f wave bursts energize the protons, while thousands of magnets guide and focus their path. For proper operation, each magnet must be aligned to tolerances on the order of 0.1 mm; hence, the support structure upon which these magnets will be located must be capable of providing small movements in all six degrees of freedom. The "Minimally Constrained Six Strut System" is being considered for this task; the struts are adjustable in length by differential threads. This paper discusses magnet alignment, gives a mathematical desciption of the problem, and discusses the rotation of the body vector. A computer program was developed. A sensitivity analysis is given. (DLC)

1302 (AECL–10302) **Beam centring in the Chalk River superconducting cyclotron.** Bigham, C.B.; Ormrod, J.H. Atomic Energy of Canada Ltd., Chalk River, ON (Canada). Chalk River Nuclear Labs. Nov 1990. 55p. Order Number DE93603776. Source: OSTI; NTIS (US Sales Only); INIS.

Beams accelerated in the Chalk River superconducting cyclotron can have trajectories throughout the accelerated region that are decentred. This decentring can be causes by incorrect parameters at injection, asymmetrical accelerating voltages or a first harmonic component in the midplane induction. These caused are discussed in detail and methods to correct the trajectories are described. Examples of turn patterns decentred by magnetic first harmonics are given, as well as the techniques used to improve the centring. (38 figs., 4 tabs., 9 refs.).

1303 (AECL–10583) **The acceleration of particles by relativistic electron plasma waves driven by the optical mixing of laser light in a plasma.** Ebrahim, N.A.; Douglas, S.R. Atomic Energy of Canada Ltd., Chalk River, ON (Canada). Chalk River Nuclear Labs. Mar 1992. 66p. Order Number DE93603777. Source: OSTI; NTIS (US Sales Only); INIS.

Electron acceleration by relativistic large-amplitude electron plasma waves is studied by theory and particle simulations. The maximum acceleration that can be obtained from this process depends on many different factors. This report presents a study of how these various factors impact on the acceleration mechanism. Although particular reference is made to the laser plasma beat-wave concept, the study is equally relevant to the acceleration of particles in the plasma wakefield accelerator and the laser wakefield accelerator.

1304 (ANL/CP–77399) **Transverse phase-space evolution in non-stationary charged particle beams.** Bohn, C.L. Argonne National Lab., IL (United States). [1992]. 4p. Sponsored by USDOE, Washington, DC (United States); Department of Defense, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-9208109–59: 16. international LINAC conference, Ottawa (Canada), 23-28 Aug 1992). Order Number DE93000618. Source: OSTI; NTIS; INIS; GPO Dep.

The transverse dynamics of a nonrelativistic, mismatched, one-dimensional sheet beam propagating through a continuous, linear focusing channel is investigated. The investigation is based on the Fokker-Planck equation in which the relaxation rate and diffusion coefficient are calculated from a simple model of turbulence resulting from charge redistribution.

1305 (ANL/CP–77445) **Influence of a distribution of deflecting-mode frequencies on the transient dynamics of cumulative beam breakup.** Bohn, C.L.; Delayen, J.R. Argonne National Lab., IL (United States). [1992]. 3p. Sponsored by USDOE, Washington, DC (United States); Department of Defense, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-9208109–57: 16. international LINAC conference, Ottawa (Canada), 23-28 Aug 1992). Order Number DE93000616. Source: OSTI; NTIS; INIS; GPO Dep.

A distribution of deflecting-mode frequencies in the constituent cavities of a linear accelerator can lead to Q-independent damping of cumulative beam breakup. A probability density for the deflecting-mode frequencies generates an effective transverse wake function. The effective wake function can be used to calculate the transient dynamics of cumulative beam breakup within the framework of a continuum approximation provided the transverse beam displacement changes little over the correlation length of the deflecting-mode frequencies as the beam moves down the linac. We adopt this approach to show that the damping induced by the effective wake function causes the rate of approach to the steady state to depend strongly on the operative probability density for the deflecting-mode frequencies.

1306 (ANL/CP–77446) **Investigation of alternating-phase focusing for superconducting linacs.** Sagalovsky, L.; Delayen, J.R. Argonne National Lab., IL (United States). [1992]. 4p. Sponsored by Department of Defense, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-9208109–60: 16. international LINAC conference, Ottawa (Canada), 23-28 Aug 1992). Order Number DE93000507. Source: OSTI; NTIS; INIS; GPO Dep.

The paper describes a new model of alternating-phase focusing (APF) dynamics applicable to ion linacs with short independently controlled superconducting cavities. The equations of motion are derived for a cylindrically symmetric electric field represented by a traveling wave with continuous periodic phase modulation. solutions are obtained and analyzed for both the linear and nonlinear particle motion. Problems of linear stability and overall longitudinal acceptance are solved using standard mathematical techniques for periodic systems; analytical results are obtained. It is shown that the main beam dynamical aspects of APF are adequately described by four parameters: equilibrium synchronous phase, phase modulation amplitude, length of APF period, and incremental energy gain. The model can be applied to study the feasibility of realizing APF in a low-β section of a proton linac.

1307 (BNL–47601) **Correcting field harmonics after design in superconducting magnets.** Gupta, R.C. Brookhaven National Lab., Upton, NY (United States). [1992]. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016. (CONF-920331–55: International industrial symposium on the super collider, New Orleans, LA (United States), 4-6 Mar 1992). Order Number DE92041311. Source: OSTI; NTIS; INIS; GPO Dep.

For a variety of reasons the actual field harmonics, as measured, in the superconducting magnets come out to be somewhat different than what were intended at the time of design. In this paper we shall discuss the schemes which can be used to correct them in the magnets. We shall discuss them for both the allowed and non-allowed harmonics. Since the deviation in field harmonics from their design value is mainly related to the mechanical properties of the coil cross section, in order for a scheme to work as planned, the mechanical configuration of the coil should not be changed significantly while this correction is being implemented.

1308 (BNL–47948) **Polarized protons at RHIC.** Makdisi, Y. Brookhaven National Lab., Upton, NY (United States). [1992]. 13p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016. (CONF-9201107–3: Adriatico research conference on polarization dynamics in nuclear and particle physics, Trieste (Italy), 7-10 Jan 1992). Order Number DE93001432. Source: OSTI; NTIS; INIS; GPO Dep.

The approval for construction of the Relativistic Heavy Ion Collider (RHIC) provides a potential opportunity to collide polarized proton beams at energies up to 500 GeV in the center of mass and high luminosities approaching $2 \times 10^{32}/cm^2/sec$. This capability is enhanced by the fact that the AGS has already accelerated polarized protons and relies on the newly completed Accumulator/Booster for providing the required polarized proton intensity and a system of spin rotators (Siberian snakes) to retain the polarization. The RHIC Spin Collaboration was formed and submitted a Letter of Intent to construct this polarized collider capability and utilize its physics opportunities. In this presentation, I will discuss the plans to upgrade the AGS, the proposed layout of the RHIC siberian snakes, and timetables. The physics focus is the measurement of the spin dependent parton distributions with such accessible probes including high p(t) jets, direct photons, and Drell Yan. The attainable sensitivities and the progress that has been reached in defining the detector requirements will be outlined.

1309 (BNL–47969) **End effects and orbit correction in the wiggler for the ATF harmonic generation FEL.** Zhang, X.; Ben-Zvi, I.; Ingold, G.; Krinsky, S.; Yu, L.H. Brookhaven National Lab., Upton, NY (United States). [1992]. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016. Order Number DE93001656. Source: OSTI; NTIS; INIS; GPO Dep.

In this paper, we consider the superconducting wiggler magnet under construction for the High Gain Harmonic Generation experiment (HGHG) at the Accelerator Test Facility (ATF) at BNL. We analyze the effects due to the ends of the wiggler and discuss their correction. In addition, the localized field produced by a trim coil for horizontal beam steering is investigated.

1310 (CEA-LNS-GT-ME–92-03) **Quadrupole error effects in the Arcs.** Nghiem, P. Laboratoire National Saturne, Centre d'Etudes de Saclay, 91 - Gif-sur-Yvette (France). Jan 1992. 8p. Order Number DE93720982. Source: OSTI; NTIS (US Sales Only); INIS.

The purpose of this study is to calculate the R_{56} term of the arcs in order to obtain an integer or a half integer number of phase oscillation for the longitudinal motion in a race-track machine. Considerations concerning cancellation of linac fluctuations in phase or in energy are also presented. Finally, a numerical simulation including effect of non linearities illustrates the differences between the different contemplated cases.

1311 (CEA-LNS-GT-ME–92-05) **Focusing in the LINAC (Phase 1).** Meot, F. Laboratoire National Saturne, Centre d'Etudes de Saclay, 91 - Gif-sur-Yvette (France). Feb 1992. 67p. Order Number DE93720983. Source: OSTI; NTIS (US Sales Only); INIS.

The periodic focusing is provided by a series of 5 a 20 m-long FODO cells (60 in the 1200 m versions), made of 0.3 m long quadrupoles spaced by 9.7 m long straight sections (in which the cavities are installed). The periodic β functions are matched for a 120 degrees phase advance for the first pass through the LINAC. On the second and third passes, the β functions are tuned by varying their initial values at the entrance of the LINAC. Five different versions of the focusing on phase 1 (15 GeV) are presented. The aim is to appreciate the evolution of the β functions and the geometrical acceptance of the LINAC, depending on such parameters as the injection energy, and the arrangement of the cavity free straight sections in the 1200 m long versions. The characteristics of these versions are also presented.

1312 (CEA-LNS-GT-ME–92-06) **Beam transport magnets for the 3-pass race-track machine.** Nghiem, P.; Tkatchenko, A. Laboratoire National Saturne, Centre d'Etudes de Saclay, 91 - Gif-sur-Yvette (France). Mar 1992. 7p. Order Number DE93720985. Source: OSTI; NTIS (US Sales Only); INIS.

The machine is composed of 5 different subsystems: - The linac in which transverse focusing is provided by a periodic structure of FODO cells. - The spreader which separates beams having different energies at the exit of the linac. - The arcs which deflect the beams by 180 deg. - The long straight sections composed of FODO cells which transport the beams from one arc to the next and contain a set of path-length adjustment dipoles (doglegs). - The recombiner which recombines beams of different energies at the linac entrance. A total of 181 main dipoles, 493 quadrupoles, 96 sextupoles and 600 corrector dipoles is necessary to transport the beam through these subsystems. In this paper, the required characteristics of these beam transport magnets are presented.

1313 (CEA-LNS-GT-ME–92-07) **Longitudinal motion in a recirculating machine.** Leleux, G.; Nghiem, P. Laboratoire National Saturne, Centre d'Etudes de Saclay, 91 - Gif-sur-Yvette (France). Mar 1992. 8p. Order Number DE93720984. Source: OSTI; NTIS (US Sales Only); INIS.

The purpose of this study is to calculate the R_{56} term of the arcs in order to obtain an integer or a half integer number of phase oscillation for the longitudinal motion in a race-track machine. Considerations concerning cancellation of linac fluctuations in phase or in energy are also presented. Finally, a numerical simulation including effect of non linearities illustrates the differences between the different contemplated cases.

1314 (CEA-LNS-GT-ME–92-09) **Energy spread, transverse emittance and beam dimensions in the 3-pass race-track machine.** Leleux, G.; Nghiem, P.; Tkatchenko, A. Laboratoire National Saturne, Centre d'Etudes de Saclay, 91 - Gif-sur-Yvette (France). Mar 1992. 31p. Order Number DE93720981. Source: OSTI; NTIS (US Sales Only); INIS.

Energy spread and transverse emittance are calculated in each subsystem (linac, arc, etc... see figure 1) of the 3-pass race-track machine. Knowing optical functions, beam dimensions are estimated. Numerical results are presented for both isochronous and non isochronous cases, in the two following phases: - phase 1 - input energy 500 MeV, output energy 15500 MeV. - Phase 2 - input energy 1000 MeV, output energy 31000 MeV.

1315 (FNAL/C–92/219) **Accelerator physics analysis with an integrated toolkit.** Holt, J.A.; Michelotti, L.; Satogata, T. Fermi National Accelerator Lab., Batavia, IL (United States). Aug 1992. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH03000. (CONF-920706–36: International conference on high energy accelerators, Hamburg (Germany), 20-24 Jul 1992). Order Number DE93000763. Source: OSTI; NTIS; INIS; GPO Dep.

Work is in progress on an integrated software toolkit for linear and nonlinear accelerator design, analysis, and simulation. As a first application, "beamline" and "MXYZPTLK" (differential algebra) class libraries, were used with an X Windows graphics library to build an user-friendly, interactive phase space tracker which, additionally, finds periodic orbits. This program was used to analyse a theoretical lattice which contains octupoles and decapoles to find the 20th order, stable and unstable periodic orbits and to explore the local phase space structure.

1316 (IYaF–91-85) **Microsecond ribbon relativistic electron beam in a plane undulator and generation of microwave radiation.** Arzhannikov, A.V.; Sinitskij, S.L.; Yushkov, M.V. AN SSSR, Novosibirsk (Russian Federation). Inst. Yadernoj Fiziki. 1991. 17p. (In Russian). Order Number DE93605693. Source: OSTI; NTIS (US Sales Only); INIS.

Results of the experiments on transport of the microsecond ribbon REB with some kiloampers current in the plane magnetic undulator at the longitudinal guiding magnetic field were described. Influence of the guiding magnetic field strength on the passing of the beam in the 1 meter undulator and generation of microwave radiation was studied in the experiments. 2 refs.

1317 (IYaF–91-86) **Beam emittance preservation in linear collider VLEPP.** Shil'tsev, V.D. AN SSSR, Novosibirsk (Russian Federation). Inst. Yadernoj Fiziki. 1991. 32p. (In Russian). Order Number DE93605694. Source: OSTI; NTIS (US Sales Only); INIS.

Ways and conditions of obtaining low transverse phase volumes of linear supercollider VLEPP beams are considered. Significance of main factors that can lead to beam emittance growth are estimated. Dynamic techniques of decreasing the emittance growth and methods of collider alignment are investigated. 24 refs.; 7 figs.; 5 tabs.

1318 (JINR-R–9-91-55) **A method for particle tracking through nonlinear fields in synchrotrons.** Shchepunov, V.A. Joint Inst. for Nuclear Research, Dubna (Russian Federation). Lab.

of High Energy. 1991. 14p. (In Russian). Order Number DE93605697. Source: OSTI; NTIS (US Sales Only); INIS.

A method for the single particle tracking in the 4-dimensional transverse phase space of synchrotrons is considered. The method is based on the numerical construction of the approximately symplectic transformations for phase coordinates. At first coordinates and Jacobi matrices are calculated by means of numerical integration of the equations of motion for some corner points of the 4-dimensional cubic cell in the phase. On this base 4-degree interpolation polynomials transformating coordinates in the approximately symplectic way inside the cell are constructed. Accuracy for the numerical integration method is evaluated through nonsymplecticity measure calculation. The dipole magnets of the JINR nuclotron are used as an example of such evaluations. The method will be useful for the long term tracking studies in the nonlinear fields of synchrotrons and storage rings. 6 refs.; 3 tabs.

1319 (JINR-R–9-91-476) **A stand for measuring the magnetic field of the isochronous cyclotron.** Alenitskij, Yu.G.; Belyaev, A.P.; Chesnov, A.F.; Chesnova, S.I. Joint Inst. for Nuclear Research, Dubna (Russian Federation). Lab. of Nuclear Problems. 1991. 6p. (In Russian). Order Number DE93605695. Source: OSTI; NTIS (US Sales Only); INIS.

A complex of equipment and software for investigation on a model of the magnetic field of isochronous cyclotron U-120I is described. A packet of programs provides the on-line control of the measuring system and the processing of measurement results of the magnetic field. 6 refs.; 3 figs.

1320 (JINR-R–9-91-494) **The resistive instability damper system for the first stage of the UNK accelerator with IIR-filter in feedback.** Zhabitskij, V.M. (Joint Inst. for Nuclear Research, Dubna (Russian Federation)); Korenev, I.L.; Yudin, L.A. Joint Inst. for Nuclear Research, Dubna (Russian Federation). 1991. 11p. (In Russian). Order Number DE93605696. Source: OSTI; NTIS (US Sales Only); INIS.

The resistive instability damper system for the coasting beam in the accelerator is discussed. The system for each of two directions of beam transverse coherent oscillations includes two pairs of pick-up electrodes and damping kickers connected by delayed negative feedback. It has been shown that damping regime can be achieved for one and the same pick-up and kicker location independently on imQ. 8 refs.; 4 figs.

1321 (LAL–92-20) **Optics analysis of Final Focus Test Beam with the help of methods based on Lie algebra.** Roy, G. Paris-11 Univ., 91 - Orsay (France). Lab. de l'Accelerateur Lineaire. Apr 1992. 135p. (In French). Order Number DE93721027. Source: OSTI; NTIS (US Sales Only); INIS.

The Final Focus Test Beam being built at SLAC is a test bed for future linear collider final focus systems. The parameters and the optics of the FFTB are presented in chapter one. The mathematical tools for this thesis which are based on Lie algebras are then reviewed in chapter two. One relies particularly on the Lie transformations together with the similarity transformation and the Campbell-Baler-Haussdorff theorem for the manipulation of Hamiltonians. Chapter three presents the application of these methods to magnetic optics in accelerators; the separation of linear and nonlinear effects and the building of the total Hamiltonian of the line from the thin-lens formulation. Chapter four analytically establishes a catalog of aberrations, up to order five in the Hamiltonians, at the FFTB. The emphasis is put on the methods of analysis. It is shown that the system has a significant fifth-order aberration and that no higher-order aberration appears. Finally chapter six presents some stability tolerances - alignment strength and multipole content - for the FFTB. In the conclusion the present situation of these methods, as well as possible computer codes using them, are reviewed.

1322 (LAL-RT–92-09) **A magnet lattice for a tau-charm factory suitable for both standard scheme and monochromatization scheme.** Beloshitsky, P. (Paris-11 Univ., 91 - Orsay (France). Lab. de l'Accelerateur Lineaire). Paris-11 Univ., 91 - Orsay (France). Lab. de l'Accelerateur Lineaire. Jun 1992. 17p. Order Number DE93721702. Source: OSTI; NTIS (US Sales Only); INIS.

A versatile magnet lattice for a tau-charm factory is considered in this report. The main feature of this lattice is the possibility to use it for both standard flat beam scheme and beam monochromatization scheme. The detailed description of the lattice is given. The restrictions following the compatibility of both schemes are discussed.

1323 (LA-UR–92-2768) **Effect of transients on the beam in the Superconducting Supercollider Coupled-Cavity Linac.** Young, L.M.; Nath, S. Los Alamos National Lab., NM (United States). [1992]. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-9208109–61: 16. international LINAC conference, Ottawa (Canada), 23-28 Aug 1992). Order Number DE93000790. Source: OSTI; NTIS; INIS; GPO Dep.

Each module of the Superconducting Super Collider (SSC) Coupled-Cavity Linac (CCL) consists of eight tanks (10 accelerating cells each) coupled with bridge couplers. The radio frequency (rf) power drive is in the center of the module at the bridge coupler between the fourth and fifth tanks. In this simulation of the beam dynamics, the rf power is turned on 10 μs before the beam is turned on. This time lapse allows the fields to build up and stabilize before they are required by the beam. When the beam is turned on, the beam loading causes the fields to change. This transient state of the fields together with their effect on the beam is presented. A model has been developed to calculate field distribution throughout the module as a function of time. Beam dynamics simulations were run with the results of this model at several times during the beam pulse. An estimate of the effect of the transients is given by the results of these simulations.

1324 (LBL–31848) **Impedance-based analysis and study of phase sensitivity in slow-wave two-beam accelerators.** Wurtele, J.S. (Massachusetts Inst. of Tech., Cambridge, MA (United States)); Whittum, D.H.; Sessler, A.M. Lawrence Berkeley Lab., CA (United States). Jun 1992. 13p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00098. (ESG–168;CONF-9206194–13: 3. international conference on advances in fusion and processing of glass, New Orleans, LA (United States), 10-12 Jun 1992). Order Number DE93000565. Source: OSTI; NTIS; INIS; GPO Dep.

This paper presents a new formalism which makes the analysis and understanding of both the relativistic klystron (RK) and the standing-wave free-electron laser (SWFEL) two-beam accelerator (TBA) available to a wide audience of accelerator physicists. A "coupling impedance" for both the RK and SWFEWL is introduced, which can include realistic cavity features, such as beam and vacuum ports, in a simple manner. The RK and SWFEL macroparticle equations, which govern the energy and phase evolution of successive bunches in the beam, are of identical form, differing only by multiplicative factors. Expressions are derived for the phase and amplitude sensitivities of the TBA schemes to errors (shot-to-shot jitter) in current and energy. The analysis allows, for the first time, relative comparisons of the RK and the SWFEL TBAs.

1325 (LBL–32222-Exc.) **Conditioner for a helically transported electron beam.** Wang, C. Lawrence Berkeley Lab., CA (United States). May 1992. 17p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00098. (ESG–182;CONF-9206193–11: Advanced accelerator concepts workshop, Port Jefferson, NY (United States), 14-20 Jun 1992). Order Number DE92041169. Source: OSTI; NTIS; INIS; GPO Dep.

The kinetic theory is developed to investigate a conditioner for a helically imported electron beam. Linear expressions for axial velocity spread are derived. Numerical simulation is used to check the theoretical results and examine nonlinear aspects of the conditioning process. The results show that in the linear regime the action of the beam conditioner on a pulsed beam mainly depends on the phase at which the beam enters the conditioner and depends only slightly on the operating wavelength. In the nonlinear regime, however, the action of the conditioner strongly depends on the operating wavelength and only slightly upon the entrance phase. For a properly chosen operating wavelength, a little less than the electron's relativistic cyclotron wavelength, the conditioner can decrease the axial velocity spread of a pulsed beam down to less than one-third of its initial value.

1326 (LBL–32516) **Bench-marking beam-beam simulations using coherent quadrupole effects.** Krishnagopal, S.; Chin,

Y.H. Lawrence Berkeley Lab., CA (United States). Jun 1992. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00098. (ESG–201;ABC–73;CONF-9204126–11: B factories: state of the art in accelerators, detectors, and physics, Stanford, CA (United States), 6-10 Apr 1992). Order Number DE92041168. Source: OSTI; NTIS; INIS; GPO Dep.

Computer simulations are used extensively in the study of the beam-beam interaction. The proliferation of such codes raises the important question of their reliability, and motivates the development of a dependable set of bench-marks. We argue that rather than detailed quantitative comparisons, the ability of different codes to predict the same qualitative physics should be used as a criterion for such bench-marks. We use the striking phenomenon of coherent quadrupole oscillations as one such bench-mark, and demonstrate that our codes do indeed observe this behaviour. We also suggest some other tests that could be used as bench-marks.

1327 (LBL–32561) **Beam-beam issues in asymmetric colliders.** Furman, M.A. Lawrence Berkeley Lab., CA (United States). Jul 1992. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00098. (ESG–205;CONF-9204126–13: B factories: state of the art in accelerators, detectors, and physics; Spring meeting of the American Physical Society, Stanford, CA (United States); Washington, DC (United States), 6-10 Apr 1992; 20-24 apr 1992; CONF-920405–2 Order Number DE93000573. Source: OSTI; NTIS; INIS; GPO Dep.

We discuss generic beam-beam issues for proposed asymmetric e^+- e^- colliders. We illustrate the issues by choosing, as examples, the proposals by Cornell University (CESR-B), KEK, and SLAC/LBL/LLNL (PEP-II).

1328 (LBL–32580) **Common analysis of the relativistic klystron and the standing-wave free-electron laser two-beam accelerator.** Wurtele, J.S. (Massachusetts Inst. of Tech., Cambridge, MA (United States)); Whittum, D.H.; Sessler, A.M. Lawrence Berkeley Lab., CA (United States). Jul 1992. 3p. Sponsored by USDOE, Washington, DC (United States); National Science Foundation, Washington, DC (United States); Japan Society for the Promotion of Science, Tokyo (Japan); National Lab. for High Energy Physics, Tsukuba, Ibaraki (Japan). DOE Contract AC03-76SF00098 ;FG02-91ER40648. (ESG–208;CONF-920706–37: International conference on high energy accelerators, Hamburg (Germany), 20-24 Jul 1992). Order Number DE92041205. Source: OSTI; NTIS; INIS; GPO Dep.

This paper summarizes a new formalism which makes the analysis and understanding of both the relativistic klystron (RK) and the standing-wave free-electron laser (SWFEL) two-beam accelerator (TBA) available to a wide audience of accelerator physicists. A "coupling impedance" for both the RK and SWFEL is introduced, which can include realistic cavity features, such as beam and vacuum ports, in a simple manner. The RK and SWFEL macroparticle equations, which govern the energy and phase evolution of successive bunches in the beam, are of identical form, differing only by multiplicative factors. The analysis allows, for the first time, a relative comparison of the RF and SWFEL TBAs.

1329 (LBL–32581) **An investigation of coherent quadrupole beam–beam effects.** Krishnagopal, S. (Lawrence Berkeley Lab., CA (United States)); Siemann, R.H. Lawrence Berkeley Lab., CA (United States). Jul 1992. 3p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00098 ;AC03-76SF00515. (ESG–207;SLAC-PUB–5869;CONF-920706–34: International conference on high energy accelerators, Hamburg (Germany), 20-24 Jul 1992). Order Number DE92041191. Source: OSTI; NTIS; INIS; GPO Dep.

We use a new simulation technique that allows us to calculate the beam-beam kick from non-Gaussian beams, to discriminate between the predications of two different theoretical models. Our results are in agreement with one of these models. We employ the simulation to better understand the nature of the coherent effects, and to explore their dependence on damping. We discuss the drawbacks in the other model and suggest improvements.

1330 (SLAC–397) **Analysis of the optics of the Final Focus Test Beam using Lie algebra based techniques.** Roy, G.J. Stanford Linear Accelerator Center, Menlo Park, CA (United States). Sep 1992. 135p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00515. Order Number DE93002220. Source: OSTI; NTIS; INIS; GPO Dep.

This report discusses the analysis of the beam optics of the final focus test beam at the Stanford Linear Collider using Lie algebra. (LSP).

1331 (SLAC-PUB–5914) **Beamstrahlung and the QED, QCD backgrounds in linear colliders.** Chen, P. Stanford Linear Accelerator Center, Menlo Park, CA (United States). Sep 1992. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00515. (CONF-9203159–8: 9. international workshop on photon-photon collisions, San Diego, CA (United States), 22-26 Mar 1992). Order Number DE93001821. Source: OSTI; NTIS; INIS; GPO Dep.

The intense radiation, called beamstrahlung, during the collision of e^+e^- beams in a linear collider, is reviewed, with attention to the influence of beam-beam disruption on the beamstrahlung spectrum. We then discuss the various detector backgrounds induced by these hard beamstrahlung photons, as well as the Weiszacker-Williams photon, through various QED and QCD processes, namely the coherent and incoherent e^+e^- pair creation and the hadron production and minijet yields.

1332 (SLAC-PUB–5920) **Using Lie Algebra methods to analytically study non-perturbative effects in beam lines.** Irwin, J. Stanford Linear Accelerator Center, Menlo Park, CA (United States). Jul 1992. 3p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00515. (CONF-920706–38: International conference on high energy accelerators, Hamburg (Germany), 20-24 Jul 1992). Order Number DE93001823. Source: OSTI; NTIS; INIS; GPO Dep.

Non-perturbative effects can arise in beam lines from strong chromatic and nonlinear elements or from large lattice errors. We present a general approach using Lie algebra methods which provides analytic treatment of beam lines with strong elements or large errors. In addition to affording insight into lattice design and performance, these techniques can answer a broad spectrum of tolerance questions without use of numerical simulations. We give several detailed examples.

1333 (SSCL-Preprint–137) **An approximate invariant using Lie algebra.** Garavaglia, T. Superconducting Super Collider Lab., Dallas, TX (United States). Aug 1992. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC35-89ER40486. (CONF-920837–7: 26. international conference on high energy physics, Dallas, TX (United States), 6-12 Aug 1992). Order Number DE93000564. Source: OSTI; NTIS; INIS; GPO Dep.

An approximate invariant is found for sextupole transverse dynamics. It is represented in terms of the elements of a Lie algebra associated with a sextupole contribution to the time-dependent Hamiltonian for transverse dynamics.

1334 (SSCL-Preprint–138-Rev.1) **Reliability of numerical solutions of a diffusion equation modeling rf noise-induced dilution in particle beams: Revision 1.** Shih, H.J. (Superconducting Super Collider Lab., Dallas, TX (United States)); Schiesser, W.; Ellison, J. Superconducting Super Collider Lab., Dallas, TX (United States). Oct 1992. 16p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC35-89ER40486. (CONF-9206185–10-Rev.1: 7. International Association of Mathematics and Computer Simulation (IMACS) international conference on computer methods for partial differential equations, New Brunswick, NJ (United States), 22-24 Jun 1992). Order Number DE93000837. Source: OSTI; NTIS; INIS; GPO Dep.

The dilution process in particle beams caused by noise in the rf accelerating system has been modeled using a diffusion equation. Particle tracking can also be undertaken to determine the effects of rf noise, through it is much more computationally extensive than integrating the diffusion equation. In this paper we present the integration results using the Method of Lines (MOL) for certain important classes of noise. We will describe the numerical algorithms in detail, including those that are made to remove anomalous solutions. Reliability of the numerical results will be checked using both

finite-difference and finite-element (Galerkin) methods in discretization and applying the same algorithms to the cases of linear and quadratic diffusion coefficients where exact solutions are known.

1335 (ANL/CP–75928) **Upgraded phase control system for superconducting low-velocity accelerating structures.** Added, N. (Sao Paulo Univ., SP (Brazil). Dept. de Fisica Nuclear); Clifft, B.E.; Shepard, K.W. Argonne National Lab., IL (United States). [1992]. 3p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-9208109–48: 16. international LINAC conference, Ottawa (Canada), 23-28 Aug 1992). Order Number DE92041125. Source: OSTI; NTIS; INIS; GPO Dep.

Microphonic-induced fluctuations in the RF eigenfrequency of superconducting (SC) slow-wave structures must be compensated by a fast-tuning system in order to control the RF phase. The tuning system must handle a reactive power proportional to the product of the frequency range and the RF energy content of the Rf cavity. The fast tuner for the SC resonators in the ATLAS heavy-ion linac is a voltage-controlled reactance based on an array of PIN diodes operating immersed in liquid nitrogen. This paper discusses recent upgrades to the ATLAS fast tuner which can now provide as much as 30 KVA of reactive tuning capability with a real RF power loss of less than 300 watts. The design was guided by numerical modeling of all elements of the device. Also discussed is the RF coupler which can couple 30 KW from 77 K tuner to a 42 K resonant cavity with less than 2 W of RF loss into 4.2 K.

1336 (ANL/CP–75930) **Design for a superconducting niobium RFQ structure.** Shepard, K.W.; Kennedy, W.L.; Sagalovsky, L. Argonne National Lab., IL (United States). [1992]. 3p. Sponsored by Department of Defense, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-9208109–49: 16. international LINAC conference, Ottawa (Canada), 23-28 Aug 1992). Order Number DE92041126. Source: OSTI; NTIS; INIS; GPO Dep.

This paper reports a design for a niobium superconducting RFQ operating at 192 Mhz. The structure is of the rod and post type, novel in that each of four rods is supported by two posts oriented radially with respect to the beam axis. Although the geometry has four-fold rotation symmetry, the dipole-quadrupole mode splitting is large, giving good mechanical tolerances. The simplicity of the geometry enables designing for good mechanical stability while minimizing tooling cost for fabrication with niobium. Results of MAFIA numerical modeling, measurements on a copper model, and plans for a beam test are discussed.

1337 (ANL/CP–76108) **Time-resolved electron-beam characterizations with optical transition radiation.** Lumpkin, A.H. (Argonne National Lab., IL (United States)); Wilke, M.D. Argonne National Lab., IL (United States). [1992]. 21p. Sponsored by USDOE, Washington, DC (United States); Department of Defense, Washington, DC (United States). DOE Contract W-31109-ENG-38 ;W-7405-ENG-36. (CONF-9208142–3: 14. international free electron laser conference, Kobe (Japan), 23-28 Aug 1992). Order Number DE92041122. Source: OSTI; NTIS; INIS; GPO Dep.

Time-resolved characterizations of electron beams using optical transition radiation (OTR) as a prompt conversion mechanism have recently been extended on the Los Alamos Free-electron Laser (FEL) facility 40-MeV linac. Two key timescales for rf-linac driven FELs are the micropulse (10 ps) and the macropulse (5 μs to 1 ms). In the past we have used gated, intensified cameras to select a single or few micropulses (25 to 400 ns gate width) out of the pulse train to evaluate submacropulse effects. Recently, we have obtained some of the first measurements of micropulse bunch length (7 to 10 ps) and submacropulse spatial position and profile using OTR and a Hamamatsu streak camera. Additionally, micropulse elongation effects and head-to-tail transverse kicks are reported as a function of charge.

1338 (ANL/CP–76539) **Target thinning using a Saddle Field Ion Source.** Thomas, G.E.; Greene, J.P. Argonne National Lab., IL (United States). [1992]. 15p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-920933–2: 16. world conference of the International Nuclear Target Development Society: nuclear target preparation, Legnaro (Italy), 21-25 Sep 1992). Order Number DE93000613. Source: OSTI; NTIS; INIS; GPO Dep.

A system is described for thinning films using a Saddle Field Ion source to produce targets which are difficult to make by other means. The method used, the beam profile, and characteristics of the various targets thinned are given.

1339 (ANL/CP–77003) **Thermal analysis of the crotch absorber in APS.** Sheng, I.C.; Howell, J. Argonne National Lab., IL (United States). [1992]. 14p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-920792–36: Society of Photo-Optical Instrumentation Engineers (SPIE) international symposium on optical applied science and engineering, San Diego, CA (United States), 19-24 Jul 1992). Order Number DE93000612. Source: OSTI; NTIS; INIS; GPO Dep.

A crotch absorber design for use in the Advanced Photon source (APS) has been proposed and analyzed. the absorber is placed downstream of sectors S2 and S4 in the curved storage ring chamber and will be subjected to a peak power of 120 W/mm^2 per 100mA synchrotron radiation. A beryllium ring is brazed on the GlidCop cooling cylinder in order to diffuse the concentrated bending magnet heating. One concentric water channel and two annular return water channels are arranged in the GlidCop cylinder to enhance the cooling. A Bodner-Partom thermoviscoplastic constitutive equation and a modified Manson-Coffin fatigue relation are proposed to simulate the cyclic thermal loading, as well as to predict the thermal fatigue life of the crotch absorber. Results of temperature and stress using finite element computations are displayed and series of e-beam welder tests and microstructure measurements are reported.

1340 (ANL/CP–77256) **High heat load synchrotron optics.** Mills, D.M. Argonne National Lab., IL (United States). Aug 1992. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-920792–35: Society of Photo-Optical Instrumentation Engineers (SPIE) international symposium on optical applied science and engineering, San Diego, CA (United States), 19-24 Jul 1992). Order Number DE93000602. Source: OSTI; NTIS; INIS; GPO Dep.

Third generation synchrotron radiation sources currently being constructed worldwide will produce x-ray beams of unparalleled power and power density these high heat fluxes coupled with the stringent dimensional requirements of the x-ray optical components pose a prodigious challenge to designers of x-ray optical elements, specifically x-ray mirrors and crystal monochromators. Although certain established techniques for the cooling of high heat flux components can be directly applied to this problem, the thermal management of high heat load x-ray optical components has several unusual aspects that may ultimately lead to unique solutions. This manuscript attempts to summarize the various approaches currently being applied to this undertaking and to point out the areas of research that require further development.

1341 (ANL/CP–77444) **Phase and amplitude stabilization of beam-loaded superconducting resonators.** Delayen, J.R. Argonne National Lab., IL (United States). [1992]. 3p. Sponsored by USDOE, Washington, DC (United States); Department of Defense, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-9208109–58: 16. international LINAC conference, Ottawa (Canada), 23-28 Aug 1992). Order Number DE93000617. Source: OSTI; NTIS; INIS; GPO Dep.

A model has been developed to analyze the static and dynamic behavior of superconducting accelerating cavities operated in self-excited loops in the presence of phase and amplitude feedback, ponderomotive effects, and beam loading. This is an extension of an earlier analysis of the stabilization of superconducting cavities which has been the basis of the control system of several superconducting accelerators but did not include beam loading. Conditions have been derived to ensure static and dynamic stability in the presence of ponderomotive effects (coupling between the mechanical and electromagnetic modes of the cavity through the radiation pressure). Expressions for the effect of fluctuations of

cavity frequency and beam amplitude and phase on the cavity-field amplitude and phase and beam-energy gain have been obtained.

1342 (ANL/HEP-CP–92-72) **A high resolution, single bunch, beam profile monitor.** Norem, J. Argonne National Lab., IL (United States). 26 Aug 1992. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-9206193–9: Advanced accelerator concepts workshop, Port Jefferson, NY (United States), 14-20 Jun 1992). Order Number DE92041127. Source: OSTI; NTIS; INIS; GPO Dep.

Efficient linear colliders require very small beam spots to produce high luminosities with reasonable input power, which limits the number of electrons which can be accelerated to high energies. The small beams, in turn, require high precision and stability in all accelerator components. Producing, monitoring and maintaining beams of the required quality has been, and will continue to be, difficult. A beam monitoring system which could be used to measure beam profile, size and stability at the final focus of a beamline or collider has been developed and is described here. The system uses nonimaging bremsstrahlung optics. The immediate use for this system would be examining the final focus spot at the SLAC/FFTB. The primary alternatives to this technique are those proposed by P. Chen /J. Buon, which analyses the energy and angular distributions of ion recoils to determine the aspect ratio of the electron bunch, and a method proposed by Shintake, which measures intensity variation of compton backscattered photons as the beam is moved across a pattern of standing waves produced by a laser.

1343 (BNL–46833-Rev.) **Behavior of TPC's in a high particle flux environment.** Etkin, A. (Brookhaven National Lab., Upton, NY (United States)); Eiseman, S.E.; Foley, K.J.; Hackenburg, R.W.; Longacre, R.S.; Love, W.A.; Morris, T.W.; Platner, E.D.; Saulys, A.C.; Lindenbaum, S.J.; Chan, C.S.; Kramer, M.A.; Zhao, K.H.; Zhu, Y.; Hallman,.Brookhaven National Lab., Upton, NY (United States). 8 Jul 1992. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016 ;AC02-83ER40107 ;AS05-81ER40032 ;AC02-76ER03274. (CONF-911106–62-Rev.: 1991 Institute of Electrical and Electronic Engineers (IEEE) nuclear science symposium and medical imaging conference, Santa Fe, NM (United States), 2-9 Nov 1991). Order Number DE92041276. Source: OSTI; NTIS; INIS; GPO Dep.

TPC's (Time Projection Chamber) used in E-810 at the AGS (Alternating Gradient Synchrotron) were exposed to fluxes equivalent to more than 10^7 minimum ionizing particles per second to find if such high fluxes cause gain changes or distortions of the electric field. Initial results of these and other tests are presented and the consequences for the RHIC (Relativistic Heavy Ion collider) TPC-based experiments are discussed.

1344 (BNL–47348) **Pressure measurements in the AGS Booster ultra-high vacuum system.** Gabusi, J.; Geller, J.; Hseuh, H.C.; Mapes, M.; Stattel, P. Brookhaven National Lab., Upton, NY (United States). [1992]. 16p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016. (CONF-9210161–4: 12. international vacuum congress; 8. international conference on solid surfaces, Hague (Netherlands); Hague (Netherlands), 12-16 Oct 1992; 12-16 oct 1992; CONF-9210162–3). Order Number DE93000378. Source: OSTI; NTIS; INIS; GPO Dep.

An average pressure of mid 10^{-11} Torr has been achieved and maintained in the AGS Booster ring vacuum system during its first year of operation. This ultra-high vacuum system is monitored through remote controlled Bayard-Alpert Gauges (BAGs). The characteristics of the pressure measurements with BAGs over the long cable lengths (up to 200 m) and under various accelerator operating conditions will be described. Two types of noise in the pressure readouts have been identified; the electromagnetic interference (EMI) associated with the acceleration cycles of the Booster and the environment noise associated with the temperature of the collector cables. The magnitude of the noise pickup depends on the routing of the collector cables and reaches the equivalent pressure of low 10^{-9} Torr.

1345 (BNL–47453) **BNL volume H^- source research.** Alessi, J.G.; McCafferty, D.; Prelec, K. Brookhaven National Lab., Upton, NY (United States). [1992]. 3p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016. (CONF-9208109–54: 16. international LINAC conference, Ottawa (Canada), 23-28 Aug 1992). Order Number DE93000375. Source: OSTI; NTIS; INIS; GPO Dep.

At BNL, work is in progress on the development of a volume production H^- ion source having a toroidally shaped plasma generation region and a conical filter field. With the original, 20 cm diameter source, up to 50 mA of H^- was measured at a current density of 25 mA/cm^2 in pulsed operation. In first results with a version of this source scaled down to 9.7 cm diameter, up to 25 mA of H^- at a current density of 50 mA/cm^2 has been obtained. In both sources the extracted electron current is typically 3–10 times the H^- current.

1346 (BNL–47621) **Recent status of superconductors for accelerator magnets.** Greene, A.F. Brookhaven National Lab., Upton, NY (United States). [1992]. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016. (CONF-9206281–2: ICFA workshop on AC superconductivity, Tsukuba (Japan), 23-25 Jun 1992). Order Number DE92041310. Source: OSTI; NTIS; INIS; GPO Dep.

A survey is given of superconductor wire and cable which has been or will be used for construction of dipole magnets for all of the large European and US superconducting accelerator rings. Included is a simplified view of the construction methods and operating requirements of an accelerator dipole magnet, with emphasis on required superconductor performance. The methods of fabricating Nb-Ti superconductors are described, including the critical parameters and materials requirements. The superconductor performance requirements are summarized in an effort to relate why these are important to accelerator designers. Some of the recently observed time dependent effects are covered briefly.

1347 (BNL–47827) **High power picosecond CO_2 laser system for ATF electron accelerator project.** Pogorelsky, I. Brookhaven National Lab., Upton, NY (United States); STI Optronics, Bellevue, WA (United States). [1992]. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016 ;AC06-83ER40128. (CONF-9206193–10: Advanced accelerator concepts workshop, Port Jefferson, NY (United States), 14-20 Jun 1992). Order Number DE92040497. Source: OSTI; NTIS; GPO Dep.

A picosecond high power CO_2 laser system is under the operation at the BNL Accelerator Test Facility. The present paper describes its components and the research efforts to meet the requirements for novel laser acceleration techniques to be tested at the ATF.

1348 (BNL–47890) **An adaptive crystal bender for high power synchrotron radiation beams.** Berman, L.E.; Hastings, J.B. Brookhaven National Lab., Upton, NY (United States). [1992]. 13p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016. (CONF-920792–32: Society of Photo-Optical Instrumentation Engineers (SPIE) international symposium on optical applied science and engineering, San Diego, CA (United States), 19-24 Jul 1992). Order Number DE93000376. Source: OSTI; NTIS; INIS; GPO Dep.

Perfect crystal monochromators cannot diffract x-rays efficiently, nor transmit the high source brightness available at synchrotron radiation facilities, unless surface strains within the beam footprint are maintained within a few arcseconds. Insertion devices at existing synchrotron sources already produce x-ray power density levels that can induce surface slope errors of several arcseconds on silicon monochromator crystals at room temperature, no matter how well the crystal is cooled. The power density levels that will be produced by insertion devices at the third-generation sources will be as much as a factor of 100 higher still. One method of restoring ideal x-ray diffraction behavior, while coping with high power levels, involves adaptive compensation of the induced thermal strain field. The design and performance, using the X25 hybrid wiggler beam line at the National Synchrotron Light Source (NSLS), of a silicon crystal bender constructed for this purpose are described.

1349 (BNL–47968) **Design of dispersion section for the ATF harmonic generation FEL.** Zhang, X.; Ben-Zvi, I.; Ingold, G.; Krinsky, S.; Yu, L.H. Brookhaven National Lab., Upton, NY (United States). [1992]. 10p. Sponsored by USDOE, Washington, DC

(United States). DOE Contract AC02-76CH00016. Order Number DE93001655. Source: OSTI; NTIS; INIS; GPO Dep.

We present an analysis of the dispersion magnet for the high gain harmonic generation experiment to be carried out at the Accelerator Test Facility at BNL. The purpose of the dispersion magnet is to convert energy modulation of the electron beam into spatial bunching. For the dispersion magnet, we discuss the physical requirements, analyze the magnetic design, determine the focusing properties, and consider the effect on the FEL gain of departures from idea behavior on the FEL gain.

1350 (CEA-CONF–11041) **Optical discriminator study for the research in particle physics.** Chipaux, R. (CEA Centre d'Etudes de Saclay, 91 - Gif-sur-Yvette (France). Dept. d'Astrophysique, de la Physique des Particules, de la Physique Nucleaire et de l'Instrumentation Associee); Derre, J.; Kochowski, C.; Lemoigne, Y.; Loucatos, S.; Rebourgeard, PCEA Centre d'Etudes de Saclay, 91 - Gif-sur-Yvette (France). Dept. d'Astrophysique, de la Physique des Particules, de la Physique Nucleaire et de l'Instrumentation Associee. 1992. 3p. (In French). (CONF-9201118–: 12. Material days of guided optics, Paris (France), 23-24 Jan 1992). Order Number DE93721697. Source: OSTI; NTIS (US Sales Only); INIS.

The author studies the feasibility of optical discrimination device that would be used for B mesons in an experiment on fixed target in the future LHC collider at CERN. Its principle has been described earlier and it is composed of a thin and spherical crystal, of refraction index $n=\sqrt{2}$. The internal and external surfaces are concentric sphere parts, axed on the target. In these conditions, a relativistic particle generates Cherenkov photons when it crosses the crystal. These photons are emitted with a different angle vs particle trajectory if this particle come directly from the target (impact parameter=0) of if it comes from secondary decay (no-zero impact parameter).

1351 (CRN-VIV–97) **Accident on the gas transfer system.** Heugel, J. Strasbourg-1 Univ., 67 (France). Centre de Recherches Nucleaires. Oct 1991. 31p. (In French). Order Number DE93721010. Source: OSTI; NTIS (US Sales Only); INIS.

An accident has happened on the Vivitron gas transfer system on the 7 th August 1991. This report presents the context, facts and inquiries, analyses the reasons and explains also how the repairing has been effected.

1352 (CRN-VIV–98) **Injector and beam transport system. Progress report at 24th October 1991.** Rebmeister, R. Strasbourg-1 Univ., 67 (France). Centre de Recherches Nucleaires. Oct 1991. 10p. (In French). Order Number DE93721011. Source: OSTI; NTIS (US Sales Only); INIS.

The status report at the 24th October of the construction, assembly and tests of the Vivitron injector and beam transport system is presented.

1353 (CRN-VIV–99) **Beam transfer line to DEMON target.** Rebmeister, R. Strasbourg-1 Univ., 67 (France). Centre de Recherches Nucleaires. Dec 1991. 7p. (In French). Order Number DE93721012. Source: OSTI; NTIS (US Sales Only); INIS.

This short report describes the beam transfer line to DEMON target on Vivitron accelerator: DEMON target situation, DEMON line optic and line working in ordinary and achromatic mode. 5 figs.

1354 (CRN-VIV–101) **Further calculations on the gas transfer system.** Gaudiot, G.; Paulus, N. Strasbourg-1 Univ., 67 (France). Centre de Recherches Nucleaires. Dec 1991. 35p. (In French). Order Number DE93721013. Source: OSTI; NTIS (US Sales Only); INIS.

The purpose of this report is to explain, by calculations, the gaps in the working of gas transfer system elements and specially those of the recirculation and final extraction.

1355 (DOE/ER/45183–8) **Materials research and beam line operation utilizing NSLS: Progress report.** Liedl, G.L. Purdue Univ., Lafayette, IN (United States). Oct 1992. 9p. Sponsored by USDOE, Washington, DC (United States); National Science Foundation, Washington, DC (United States). DOE Contract FG02-85ER45183 ;FG02-84ER45097. Grant DMR-912-0000;Grant DMR-9011069. Order Number DE93002095. Source: OSTI; NTIS; GPO Dep.

MATRIX, a participating research team of Midwest x-ray scattering specialists, continues to operate beam line X-18A at NSLS. Improvements of the beam line continue to be a focus of MATRIX, including simplified control operations and personal computers. Over the past year the full 227 operational days were utilized. Beam line tests and evaluation coupled with eight MATRIX groups combined to use 179 days. General user demand for use of the beam line continues to be strong and four groups were provided 48 operating days. Among the milestones achieved last year is the first quantitative structural study of the early stages of decomposition of supersaturated Al-Li alloys. Another study utilized the beam line to provide new information on distortions of Cu_20 planes in the cuprate superconductors. A third study illustrates the application of an UHV chamber with low temperature capability and in-situ LEED. Experiments on a simple physisorbed film Xe on Ag (111) showed intensity oscillations during layer-by-layer growth analagous to the RHEED oscillations seen in MBE growth. One beam line improvement is the addition of a capability to make measurements out of the scattering plane.

1356 (EGG–10617-5116) **Beam monitor for subnanosecond proton bunches.** Hilko, R.A. (EG and G Energy Measurements, Inc., Los Alamos, NM (United States). Los Alamos Operations); Harper, R.W.; Klingler, Q.C.; Liljestrand, R.P.; Hunt, L.; Rowton, L. EG and G Energy Measurements, Inc., Los Alamos, NM (United States). Los Alamos Operations. [1992]. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC08-88NV10617 ;W-7405-ENG-36. (CONF-9209206–2: Symposium of northeastern accelerator personnel (SNEAP), Quebec (Canada), 23-25 Sep 1992; LA-UR–92-3061). Order Number DE93000693. Source: OSTI; NTIS; GPO Dep.

A custom-built device to monitor subnanosecond bunches of protons will provide temporal information on the proton bunch by sensing the electrical field of the proton bunch. This device is called a nonintercepting beam monitor (NIBM) and two have been installed. One sits between the analyzing magnet and switching magnet for the beam lines out of the tandem accelerator of the Ion Beam Facility (EBF) of the Los Alamos National Laboratory (LANL). Another has been placed 2 ft. in front of the target chamber on beamline R3. Each has its own high-bandwidth recording system with oscilloscope display. Critical inspection of the NIBM pulses has led to consistent subnanosecond operation of the tandem.

1357 (FNAL/C–92/95) **SSC 50 mm collider dipole cryostat single tube support post conceptual design and analysis.** Nicol, T.H. Fermi National Accelerator Lab., Batavia, IL (United States). Apr 1992. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH03000. (CONF-920331–57: International industrial symposium on the super collider, New Orleans, LA (United States), 4-6 Mar 1992). Order Number DE93000620. Source: OSTI; NTIS; INIS; GPO Dep.

This report describes the conceptual design for a support post whose function is identical to that of the current reentrant design, which requires very few modifications to surrounding cryostat components, is thermally equivalent to the current 50 mm support post, and is nearly equivalent structurally. The focus of this work is on a design aimed specifically at application in SSC 50 mm collider dipoles, however, the conceptual design presented here is applicable to other cryogenic systems.

1358 (FNAL/C–92/97) **Stress relaxation in SSC 50mm dipole coils.** Rogers, D.; Markley, F. Fermi National Accelerator Lab., Batavia, IL (United States). Apr 1992. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH03000. (CONF-920331–56: International industrial symposium on the super collider, New Orleans, LA (United States), 4-6 Mar 1992). Order Number DE93000619. Source: OSTI; NTIS; INIS; GPO Dep.

We are measuring the stress relaxation of SSC 50mm outer coils with the goal of predicting how much of the coil prestress will be lost while the coils are warehoused between manufacture and cooldown. We manufacture 3 inch (76.2mm) long segments of coil with the same materials and techniques that have been used for

prototype coils. We are running four simultaneous tests in an attempt to separate the contributions of the different coil materials. Test one is a completely insulated coil section where the insulation is the all polyamide system being tested at Brookhaven; test two is a wire stack insulated only with the normal Kapton overwrap; test three is a stack of bare cable; and test four is a completely insulated normal coil section. All, except for the bare cable, include the ground insulation. The insulated coil sections are carefully dried before loading and testing in order to eliminate stress changes due to varying moisture content. The temperature dependence of the stress relaxation is being studied separately. Three companion papers presented at this conference will be: (1) "Temperature dependence of the viscoelastic properties of SSC coil insulation" (2) "Measurement of the elastic modulus of Kapton perpendicular to the plane of the film at room and cryogenic temperatures" (3) "Theoretical methods for creep and stress relaxation studies of SSC coil."

1359 (FNAL/C–92/102) **Theoretical methods for creep and stress relaxation studies of SSC coil.** McAdams, J.; Markley, F. Fermi National Accelerator Lab., Batavia, IL (United States). Apr 1992. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH03000. (CONF-920331–58: International industrial symposium on the super collider, New Orleans, LA (United States), 4-6 Mar 1992). Order Number DE93000621. Source: OSTI; NTIS; INIS; GPO Dep.

Extrapolation of laboratory measurements of SSC coil properties to the actual construction of SSC magnets requires mathematical models of the experimental data. A variety of models were used to approximate the data collected from creep and stress relaxation experiments performed on Kapton film and SSC coil samples. The coefficients for these mathematical models were found by performing a least-squares fit via the program MINUIT. Once the semiempirical expressions for the creep data were found, they were converted to expressions for stress relaxation using an approximate I pn of the Laplace integral relating the two processes. The data sets from creep experiments were also converted directly to stress relaxation data by numeric integration. Both of these methods allow comparison of data from two different methods of measuring viscoelastic properties. Three companion papers presented at this conference will present: Stress relaxation in SSC 50mm dipole coil. Measurement of the elastic modulus of Kapton perpendicular to the plane of the film at room and cryogenic temperatures. Temperature dependence of the viscoelastic properties of SSC coil insulation (Kapton).

1360 (IPNO–91-06) **MACSE CM-2 cryo modulus: IPN calculations and tests of cryostat.** Buhler, S. Paris-11 Univ., 91 - Orsay (France). Inst. de Physique Nucleaire. 1991. 66p. (In French). Order Number DE93721029. Source: OSTI; NTIS (US Sales Only); INIS.

This report presents the test object of CM-2 MACSE cryo modulus, test facilities, valuations of heat flux, test programs and results. It presents also the study of thermo-acoustic oscillations.

1361 (IPNO–91-07) **Surface temperature measurements on superconducting cavities in superfluid helium.** Fouaidy, T.; Junquera, T.; Caruette, A. Paris-11 Univ., 91 - Orsay (France). Inst. de Physique Nucleaire. 1991. 30p. (CONF-9108189–: 5. rf superconductivity workshop at DESY, Hamburg (Germany), 19-21 Aug 1991). Order Number DE93721056. Source: OSTI; NTIS (US Sales Only); INIS.

Two thermometry systems have been developed: a scanning thermometer system routinely used for the 1.5 GHz monocell cavity studies and a fixed thermometer array used to investigate spatial surface resistance distribution on various SC removable endplates of a cylindrical TE011mode cavity. Thermometers used in these systems are thermally insulated from the surrounding HeII bath by an epoxy housing ('epoxy'thermometers). Accurate calibration of the fixed thermometers was conducted by using different test cells and the experimental results were compared to model calculations performed with a finite element computational code. Measured thermometer efficiency and linearity are in good agreement with numerical results. Some typical temperature maps of different Nb samples obtained with the TE011 array (40 epoxy thermometers) are discussed. On the basis of numerical modelling results, a new type of thermometer with an improved efficiency has been designed. The thermal insulation against Helium II has been drastically improved by placing the sensitive part of the thermometer in a small vacuum jacket ('vacuum' thermometers). Two main goals have been reached with the first prototypes: improved efficiency by a factor of 2.5 - 3, and a bath temperature dependence of the thermal response in good agreement with the expected Kapitza conductance behaviour. Fitting experimental results with numerical modelling data, allow us to estimate the Kapitza conductance. The obtained values are in good agreement with the previous results reported by several authors using a different measurement method. The 'vacuum' thermometers are currently used on the TE011 mode cavity with Nb and NbTiN plates and the first results are presented.

1362 (IPNO–92-02) **Equipment and working of gas circuit for the 'Empereur' tandem isolation, by sulfur hexafluoride.** Decourt, M.; Le Bervet, L.; Leroy, R.; Mangano, M.; Said, A. Paris-11 Univ., 91 - Orsay (France). Inst. de Physique Nucleaire. Feb 1992. 20p. (In French). Order Number DE93721018. Source: OSTI; NTIS (US Sales Only); INIS.

This report described the equipment and the working of the circuit gas for the 'Empereur' tandem isolation by sulfur hexafluoride.

1363 (IPNO-T–91-05) **Magnetic study of extraction elements of compact cyclotron beam with AGOR superconducting coils.** Gustafsson, S. Paris-11 Univ., 91 - Orsay (France). Inst. de Physique Nucleaire. Dec 1991. 182p. (In French). Order Number DE93721032. Source: OSTI; NTIS (US Sales Only); INIS.

The extraction system of the superconducting cyclotrons is normally making a large use of electric extractors followed by magnetostatic elements. The electric field limit initially hoped for (14 MV/m) has been shown to be too optimistic. A more realistic value is around 10 MV/m in the concerned geometries. The first element of the AGOR extraction system is an electrostatic channel where the maximum electric field is limited to 10.5 MV/m. The smaller separation between the internal beam and the extracted beam at the entrance of the first magnetic element is compensated by the replacement of the usual magnetostatic channels with high power electromagnetic channels placed in the reduced space close to the internal beam and where the horizontal position can be adjusted according to the kind of ion accelerated and its energy. The fringing field very close to the channels is controlled with the help of correction coils reducing the perturbations of the internal beam trajectories to an acceptable level.

1364 (IYaF–90-148) **Electric field strength measuring in a megavolt vacuum diode using active Stark spectroscopy.** Knyazev, B.A.; Mel'nikov, P.I.; Chikunov, V.V. AN SSSR, Novosibirsk (Russian Federation). Inst. Yadernoj Fiziki. 1991. 12p. (In Russian). Order Number DE93605716. Source: OSTI; NTIS (US Sales Only); INIS.

Results of measuring the electric field intensity local values depending on time in a high-voltage vacuum diode during an intense electron beam generation are presented. In the experiments conducted at the U-1 100 KY accelerator the voltage on a diode achieves 0.9 MV and the beam current-55 kA under 4.4 μs pulse duration. The experimental results allow one to reconstruct the motion of emission boundaries of cathode and anode plasma. 16 refs.

1365 (IYaF–91-42) **Duoplasmatron with a hollow cold cathode.** Chumakov, S.N.; Shamovskij, V.G. AN SSSR, Novosibirsk (Russian Federation). Inst. Yadernoj Fiziki. 1991. 13p. (In Russian). Order Number DE93605706. Source: OSTI; NTIS (US Sales Only); INIS.

To increase the resource of ion source operation a duoplasmatron design with cold hollow cathode is developed. The duoplasmatron discharge chamber comprises a water-cooled copper anode to which a molybdenum fuse with emission hole (0.8 mm diameter) is sealed in and a hollow copper water-cooled cathode. The cathode design adopted provides for a stable discharge burning and reliable continuous operation of an ion source during 100 hours of continuous operation. 8 refs.; 8 figs.

1366 (IYaF–91-58) **Designing of electromagnetic devices.** Persov, B.Z.; Trakhtenberg, Eh.M. AN SSSR, Novosibirsk (Russian Federation). Inst. Yadernoj Fiziki. 1991. 73p. (In Russian). Order Number DE93605717. Source: OSTI; NTIS (US Sales Only); INIS.

General questions concerning the theory, calculation and designing of electromagnetic devices, including the magnetic field in space and substance, magnetic materials, calculation of basic magnetic circuit parameters etc, are presented. Specific problems related to heat release and heat removal in electromagnetic devices as well as problems of correlation between the device designed and supply source are considered. Methods for calculating and designing electromagnetic devices of different destination-turning magnets; charged particle movement trajectory correctors, tractive electromagnets etc. are described. 35 refs.; 29 figs.; 1 tab.

1367 (IYaF–91-76) **Stabilization of thermal instability of electrodes of a multisilt ion-optical system by means of longitudinal tension.** Davydenko, V.I.; Morozov, I.I. AN SSSR, Novosibirsk (Russian Federation). Inst. Yadernoj Fiziki. 1991. 10p. (In Russian). Order Number DE93605707. Source: OSTI; NTIS (US Sales Only); INIS.

A thermoelastic model of a single electrode of a multiself ion-optical system allowing one to determine the instability region is proposed. Problems of thermal instability stabilization by longitudinal tension of electrodes for ion-optical system of the IK-50 quasistationary proton source are considered. 5 refs.; 2 figs.

1368 (JINR–9-91-457) **Cyclotron ion source with cold hollow cathode.** Vasil'ev, N.V.; Glazov, A.A.; Novikov, D.L. Joint Inst. for Nuclear Research, Dubna (Russian Federation). Lab. of Nuclear Problems. 1991. 4p. (In Russian). Order Number DE93605709. Source: OSTI; NTIS (US Sales Only); INIS.

The results of the development and investigation of the horizontal PIG ion source with the cold hollow cathode are described. This ion source can be used in cyclotrons with a magnet pole gap not less that 60 mm. The desired value of H^- beam extracted from this ion source has been obtained that is quite for cyclotron type accelerators. 6 refs.; 4 figs.

1369 (JINR-R–9-90-547) **Precision monitor of bunched beam intensity.** Zhabitskij, V.M.; Mel'nikov, V.A.; Popov, S.A. Joint Inst. for Nuclear Research, Dubna (Russian Federation). 1990. 6p. (In Russian). Order Number DE93605725. Source: OSTI; NTIS (US Sales Only); INIS.

The method of beam intensity measuring for UNK 1 stage is proposed. The intensity may be measured in the bunch and during orbiting with the accuracy $\pm 0.3\%$. The tensor is based on the wide band toroidal current transformer. Synchronization terms are not hard thanks to a special regime of the low level electronics. The down-frequency clipping distortion is compensated by additional measurings and analog processing. The requirements to the transformer transfer function for measuring the bunch intensity of an arbitrary shape are substantiated. 5 refs.; 4 figs.

1370 (JINR-R–9-90-574) **Combined deflector for isochronous cyclotron U-120K.** Borisov, O.N.; Vorozhtsov, S.B.; Dmitrievskij, V.P.; Morozov, N.A.; Chesnov, A.F.; Chesnova, S.I. Joint Inst. for Nuclear Research, Dubna (Russian Federation). Lab. of Nuclear Problems. 1990. 14p. (In Russian). Order Number DE93605715. Source: OSTI; NTIS (US Sales Only); INIS.

The calculations of a system for deflection of a beam from the chamber of isochronous cyclotron U-120K, which accelerates protons (11-40 MeV), deuterons (6-17 MeV) alpha-particles (11-35 MeV) and helium-3 ions (15-45 MeV). are reported. The deflecting channel consists of the electrostatic, electromagnetic, and current sections. The parameters of channel sections, configurations of electrodes, current coils and ferromagnetic plates ensuring the required electric and magnetic fields are given. The calculated beam extraction efficiency is shown to be $\geq 80\%$ for the whole range of the accelerated particles. Beam losses in the channel do not exceed 10%. 7 refs.; 9 figs.; 3 tabs.

1371 (JINR-R–9-91-31) **MIMI - microtron source of multicharged ions.** Shelaev, I.A. Joint Inst. for Nuclear Research, Dubna (Russian Federation). Lab. of High Energy. 1991. 11p. (In Russian). Order Number DE93605708. Source: OSTI; NTIS (US Sales Only); INIS.

The conceptual design of a new source of multicharge ions is given. It's possible with the source to get the beam intensity of nuclei with masses A=20-60 in the range up to 10^{12} p/sec in dc mode or 10^{12} p/pulse in the pulse one. 9 refs.; 3 figs.; 1 tab.

1372 (JINR-R–10-91-35) **An autonomous microprocessor system for measurement of betatron oscillation parameters using signal processor.** Ganbat, G.; Glejbman, Eh.M. Joint Inst. for Nuclear Research, Dubna (Russian Federation). 1991. 4p. (In Russian). Order Number DE93605723. Source: OSTI; NTIS (US Sales Only); INIS.

The special-purpose microprocessor system for measurement of betatron oscillation parameters of an accelerated particle beam is designed. The unit carried out on the basis of the signal processor TMS 32010 is the main part of the system. The information about betatron oscillation frequency is obtained by the method of the fast Fourier transformation (FFT) of the mass data about a bunch deviation from orbits during revolutions. The dimension of the massif choice can be changed from 16 up to 1024. The total execution time for FFT occupies 70 ms. The system can be used for any research purpose (to elaborate different algorithms of FFT with lesser numbers) and as a Q-monitor. 4 refs.; 2 figs.

1373 (JINR-R–13-90-532) **Stabilized power supply unit for the correcting windings of the iron-current channel at the JINR phasotron.** Akhmanov, V.V.; Batmanova, Eh.K.; Kazakova, G.G.; Kalinichenko, V.V.; Solomnikov, V.P. Joint Inst. for Nuclear Research, Dubna (Russian Federation). Lab. of Nuclear Problems. 1990. 8p. (In Russian). Order Number DE93605714. Source: OSTI; NTIS (US Sales Only); INIS.

A stabilized 3.2 kA, 6 V power supply unit for the correcting winding of the iron-current channel in the beam extraction system of the JINR phasotron is described. The current instability and pulsation are $\approx 10^{-3}$. The unit uses a magneto-modulation current transducer connected to the primary side of the power converter. The transducer is based on the magnetic modulator with bipolar pulsed excitation. The block-diagram of the current transducer and the circuit diagrams of some blocks of the stabilized power supply unit are given. 7 refs.; 5 figs.

1374 (JINR-R–13-90-580) **The multichannel serial-parallel measurement system for slow-changing signals.** Zubareva, A.M.; Kim Zen Srer; Sokolova, N.V.; Subbotin, V.G.; Sukhov, A.M. Joint Inst. for Nuclear Research, Dubna (Russian Federation). Lab. of Nuclear Reactions. 1990. 10p. (In Russian). Order Number DE93605724. Source: OSTI; NTIS (US Sales Only); INIS.

A measurement system for the automatic control of parameters of the U-400 accelerator is described. It includes a 16-channel analog multiplexor, a voltage-frequency converter, a counting ratemeter and a control generator. The counting ratemeter has a memory unit in side. The modules are developed in the CAMAC standard. The system provides the measurement of about 100 parameters with 0.1% accuracy for 0.2-0.5 s cycle. 4 refs.; 5 figs.

1375 (LAL–92-11) **Theoretical and experimental studies of hyperfrequency electron guns with high brightness.** Gao, J. Paris-11 Univ., 91 - Orsay (France); Paris-11 Univ., 91 - Orsay (France). Lab. de l'Accelerateur Lineaire. Apr 1992. 233p. (In French). Order Number DE93720938. Source: OSTI; NTIS (US Sales Only); INIS.

A single cavity RF gun with thermionic cathode (LaB_6) was studied and constructed at the Institute of High Energy Physics, Academia Sinica, Beijing, P.R. China. This RF gun was used as the injector of a 30 MeV Linac for the Beijing Free Electron Laser Project. In the experiments the electron back-bombardment effect and another phenomenon connected with cathode temperature were observed. After carefully choosing the operation parameters, this RF gun injector could stably provide electron beams suitable for doing preliminary FEL experiments. Based on the theoretical analysis a computer code (including space charge forces) was written to simulate the dynamics of electrons in this injector. The photocathode RF gun was investigated theoretically and new design criteria were established. Based on these criteria a two decoupled cavities RF gun, using a laser triggered photocathode, has been designed for the 'LAL/Orsay RF gun project', and model cavities have been fabricated. Based on the model cavity measurement results, the

final cavities have been fabricated and measured. Aiming at reducing further the emittance of electron bunches coming out of the second cavity, linear and nonlinear emittance compensating techniques have been proposed. As a new kind of electron injector suitable for FEL and future e^+e^- linear colliders, a travelling wave RF gun has been investigated theoretically and compared with the standing wave RF. Stimulated by the experimental results on the model cavities, several useful analytical formulae have been derived and verified by the experimental results: (1) Analytical formulae for the coupling coefficient β of a cavity-waveguide coupling system. (2) Analytical formulae for the resonant frequency changes due to opening apertures on cavity walls. (3) Analytical formulae for the coupling coefficient k (or group velocity v_g) of forward and backward travelling wave linear accelerators.

1376 (LA-UR–92-2816) **High temperature heat treatment of 3GHz niobium cavities.** Diete, W. (Wuppertal Univ. (Gesamthochschule) (Germany)); Rusnak, B.; Bennett, B.L.; Clark, W.L.; Maggs, R.G.; Shapiro, A.H.; Wright, P.V. Los Alamos National Lab., NM (United States). [1992]. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-9208109–62: 16. international LINAC conference, Ottawa (Canada), 23-28 Aug 1992). Order Number DE93000789. Source: OSTI; NTIS; INIS; GPO Dep.

We applied high temperature heat treatment to 3GHz cavities to determine the preparation of niobium cavities using the titanium solid-state gettering process. Some preliminary results showed peak surface electric fields of up to 65MV/m at a Q-factor of 2×10^{10}. We evaluated improvement in the purity of the niobium by measuring the residual resistance ratio (RRR) at 10K. The purest niobium we prepared reached a RRR of 670. To study the potential application to large-scale accelerator structures at lower frequencies, we are testing the possibility of heat treating the cavity half-cells before welding them. Therefore, we investigated the influence of electron beam welding on the RRR of high-purity niobium.

1377 (LA-UR–92-2998) **Radiation damage considerations in a high luminosity collider: The interaction region.** Lee, D.M. Los Alamos National Lab., NM (United States). [1992]. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-9111208–3: 19. INFN eloisation project: maximizing luminosity of hadron colliders at 100 TeV, Erice (Italy), 13-19 Nov 1991). Order Number DE93000685. Source: OSTI; NTIS; INIS; GPO Dep.

The interaction region in a high luminosity collider will be a source of radiation for all components in the vicinity and will place stringent requirements on their design. The major components in the vicinity and will place stingent requirements on their design. The major components in the vicinity of the interaction region are the physics detectors that surround the beam pipe and the focusing quadrupole magnets nearby. We will present the radiation levels in such a physics detector and the power in the forward direction that will be deposited in the forward calorimeters and quad magnets. The implications of the levels on a variety of detector components and electronics will be presented. The calculational techniques and limitation will be reviewed.

1378 (LA-UR–92-3017) **Lasing attempts with a microwiggler on the Los Alamos FEL.** Warren, R.W.; O'Shea, P.G.; Bender, S.C.; Carlsten, B.E.; Early, J.W.; Feldman, D.W.; Fortgang, C.M.; Goldstein, J.C.; Schmitt, M.J.; Stein, W.E.; Wilke, M.D.; Zaugg, T.J.; Newnam, B.E.; Sheffield, R.L. Los Alamos National Lab., NM (United States). [1992]. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-9208142–5: 14. international free electron laser conference, Kobe (Japan), 23-28 Aug 1992). Order Number DE93000681. Source: OSTI; NTIS; INIS; GPO Dep.

The APEX FEL normally lases near a wavelength of 3μm using a permanent magnet wiggler with a 2.7-cm period and a linear accelerator of 40-MeV energy. Los Alamos National Laboratory is conducting a series of experiments with the goal of lasing at significantly shorter wavelengths with the same accelerator and the same kind of near-concentric resonator, but using a novel pulsed microwiggler of 0.5-cm period capable of generating a peak field of several tesla. We plan to lase on a fundamental wavelength of ~0.8 μm and on the third harmonic at 0.25 μm.

1379 (LA-UR–92-3165) **An intense source of positrons using a low energy proton beam.** Channell, P.J.; Dreicer, H. Los Alamos National Lab., NM (United States). [1992]. 18p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-9206193–12: Advanced accelerator concepts workshop, Port Jefferson, NY (United States), 14-20 Jun 1992). Order Number DE93000697. Source: OSTI; NTIS; INIS; GPO Dep.

An intense source of positrons would make it possible to consider linear collider designs for the flavor factories now being proposed. Such designs might have the advantage of higher luminosity than circular colliders and would also provide an arena for the further development of linear colliders in preparation for the next generation of TeV linear colliders. An intense source of positrons would also make it possible to be more flexible in the design of the next generation of TeV linear colliders. The two conventional sources of positrons now used are electron-beam electroproduction of positrons and reactor-produced β^+-unstable isotopes. Electroproduction sources can be fairly efficient, but suffer from the disadvantages of high capital cost and destruction of the target at higher fluxes. Reactor sources are much more inefficient and have much higher capital costs than electroproduction sources, but might make sense if a reactor already exists at an appropriate site and is principally used for other purposes. In this paper we will show that it should be possible to produce large fluxes of positrons using intense proton beams of modest energy. The basic idea is to use protons from an accelerator rather than neutrons from a reactor to produce β^+-unstable isotopes by the proton capture reaction. Because the targets of a proton beam can be handled more conveniently and much more quickly than insertions in reactors, we are able to consider a larger range of possible targets with shorter decay times than is reasonable for a reactor.

1380 (LA-UR–92-3203) **Accelerator-control-system interface for intelligent power supplies.** Cohen, S. Los Alamos National Lab., NM (United States). [1992]. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-920843–1: 3. Institute of Electrical and Electronic Engineers (IEEE) workshop on computers in power electronics, Berkeley, CA (United States), 9-11 Aug 1992). Order Number DE93000863. Source: OSTI; NTIS; INIS; GPO Dep.

A number of high-current high-precision magnet power supplies have been installed at the proton storage ring at the Los Alamos National Laboratory Accelerator Complex. The units replace existing supplies, powering large dipole magnets in the ring. These bending magnets require a high-current supply that is precise and stable. The control and interface design for these power supplies represents a departure from all others on-site. The supplies have sophisticated microprocessor control on-board and communicate with the accelerator control system via RS-422 (serial communications). The units, built by Alpha Scientific Electronics, Hayward, CA use a high-level ASCII control protocol. The low-level "front-end" software used by the accelerator control system has been written to accommodate these new devices. They communicate with the control system through a terminal server port connected to the site-wide ethernet backbone. Details of the software implementation for the analog and digital control of the supplies through the accelerator control system will be presented.

1381 (LBL–30451) **Development of a dc, broad beam, Mevva ion source.** Brown, I.G.; Dickinson, M.R.; Galvin, J.E.; MacGill, R.A. Lawrence Berkeley Lab., CA (United States). Sep 1991. 15p. Sponsored by Department of Defense, Washington, DC (United States). DOE Contract AC03-76SF00098. Contract ARO 116-89. (CONF-910943–6: 4. international conference on ion sources, Bensheim (Germany), 30 Sep - 4 oct 1991). Order Number DE92041167. Source: OSTI; NTIS; INIS; GPO Dep.

We are developing an embodiment of metal vapor vacuum arc (Mevva) ion source which will operate dc and have very large area beam. In preliminary testing, a dc titanium ion beam was formed with a current of approximately 0.6 amperes at an extraction voltage of 9kV (about 18 keV ion energy, by virtue of the ion charge state distribution) and using an 18 cm diameter set of multi-aperture. Separately, we have tested and formed beam from a 50 cm diameter (2000 cm_2) set of grids using a pulsed plasma gun.

This configuration appears to be very efficient in terms of plasma utilization, and we have formed beams with diameter 33 cm (FWHM) and ion current up to 7 amperes at an extraction voltage of 50 kV (about 100 keV mean ion energy) and up to 20 amperes peak at the current overshoot part of the beam pulse. Here we describe this Part Of our Mevva development program and summarize the results obtained to-date.

1382 (LBL–32446) **B factory rf system design issues.** Zisman, M.S. Lawrence Berkeley Lab., CA (United States). Jun 1992. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00098. (ESG–195;ABC–72;CONF-9204126–10: B factories: state of the art in accelerators, detectors, and physics, Stanford, CA (United States), 6-10 Apr 1992). Order Number DE92041211. Source: OSTI; NTIS; INIS; GPO Dep.

We discuss the issues of relevance to the design of a B factory RF system. First, the general parameter regime is outlined, and the reasons behind certain commonly made choices are indicated. This regime involves high beam currents, and many relatively short bunches. Next, the physics difficulties associated with coupled-bunch instabilities are described briefly. We then describe in general terms the alternative approaches taken by various B factory designers, the motivation for these choices, and the technical issues raised by them. Technical solutions have been proposed for both the room-temperature and the superconducting RF scenarios, and considerable R&D is being carried out worldwide to confirm and optimize these solutions.

1383 (LBL–32452-Abst.) **End design of the SSC 58 mm High Gradient Quadrupole.** Caspi, S. Lawrence Berkeley Lab., CA (United States). 10 Jun 1992. 27p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00098. (SC-MAG–385). Order Number DE92041190. Source: OSTI; NTIS; INIS; GPO Dep.

The "end" design of the High Gradient Quad. was done with consideration to the integrated field harmonics, the iron contribution, and the maximum field at the conductor. Magnetic analysis was done on the return end only, however the physical dimension of the lead end were determined as well. Using the cross-section of the windings and Cook's program BEND, we generated the physical end windings around the return end. Placing a single wire at the center of each turn the integrated gradient was computed and iterating on the end block spacers the integrated harmonics minimized. The final geometry was then used for more, extensive calculations, such as the field at the conductor and the 3D field harmonics. For this detailed calculation we have placed a single line current at the center of each strand and included the iron contribution ($\mu = \infty$), see Appendix C. With the termination of the iron serving as a reference, the maximum length of the inner and outer layers are 182 mm and 215 mm respectively. The magnetic length of the end was computed from the gradient function A_2 and was found to be 142 mm. In reality we expect the physical length of the end to be somewhat larger, however this should have little or no effect on the magnetic length. The gradient in the straight section is 212.44 T/m at 7000 A and the integrated value of the gradient is -3.01665 E5 (G) in the end region marked by the magnetic length of the end. The respective integrated harmonics for the end 12 pole and 20 pole are -10.6658 (G/CM^4) and 0.7279 (G/cm^8) corresponding to b_6 = 0.351 , b_{10} = -0.024 units. The above was computed from the values of A_2, A_6, and A_{10}.

1384 (LBL–32463) **Sensitivity studies of a standing-wave free-electron laser.** Rangarajan, G.; Sessler, A. Lawrence Berkeley Lab., CA (United States). Jun 1992. 27p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00098. (ESG–197;CONF-9206193–14: Advanced accelerator concepts workshop, Port Jefferson, NY (United States), 14-20 Jun 1992). Order Number DE93000575. Source: OSTI; NTIS; INIS; GPO Dep.

A standing-wave free-electron laser (SWFEL) has been proposed for use in a two-beam accelerator (TBA). We modify the previous one-dimensional discrete cavity model of the SWFEL by introducing drifts between cavities. We also vary the input beam energy as a function of the bunch number. In this new model, we obtain a stable equilibrium solution for a well-bunched beam (even after including all nonlinear terms). We obtain analytic expressions characterizing this equilibrium in the limit of small cavity lengths. We study the dependence of fluctuations in signal phase along the device as a function of detuning, input beam energy, beam length, current errors, and initial signal field amplitude. We are able to find an optimized set of parameters for which the output energy changes by less than 3% across the cavities for a 1% detuning. The maximum change in signal phase is less than 0.12 radians.

1385 (LBL–32468) **Effects of parasitic beam-beam interaction during the injection process at the PEP-II B Factory.** Chin, Y.H. Lawrence Livermore National Lab., CA (United States). Jun 1992. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00098. (ESG–194;CONF-9204126–12: B factories: state of the art in accelerators, detectors, and physics, Stanford, CA (United States), 6-10 Apr 1992). Order Number DE92041171. Source: OSTI; NTIS; INIS; GPO Dep.

This paper is concerned with beam-beam effects during the injection process at the proposed asymmetric SLAC/LBL/LLNL B-Factory, PEP-II. It is shown that the parasitic beam-beam interaction can lead to a significant blowup in the vertical size of the injected beam. Simulation results for the horizontal and the vertical injection schemes are presented, and their performances are studied.

1386 (LBL–32680) **Performance of the LBL AECR source at various frequencies.** Xie, Z.Q.; Lyneis, C.M.; Lundgren, S.A.; Collins, D. Lawrence Berkeley Lab., CA (United States). Jul 1992. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00098. (CONF-920741–5: 13 international conference on cyclotrons and their applications, Vancouver (Canada), 6-16 Jul 1992). Order Number DE93000634. Source: OSTI; NTIS; INIS; GPO Dep.

To study the effects of frequency on an electron cyclotron resonance (ECR) ion source, the LBL Advanced ECR ion source (designed to operate at 14 GHz) has been tested at 6.4, 10, and 14 GHz with one plasma chamber (ID = 6.0 cm), a permanent sextuple magnet ("closed sextuple") with a field strength of 0.84 Tesla at the chamber wall, and no radial vacuum pumping. Pure oxygen was used as the running gas for a fair comparison. The source was tested as a single stage, as well as with cold electron injection using an electron gun in place of a conventional microwave-driven first stage. Higher frequency, with a higher axial magnetic field to ensure a closed ECR zone for electron heating, does give better performance. As demonstrated before, at each frequency electron injection led to about a factor of two increase in the high charge state oxygen beam intensity. The 14 GHz performance of the AECR source with the closed sextuple magnet was compared to the "slotted sextuple" (a plasma chamber with radial pumping slots of 7.0-cm dia and a weaker magnet of 0.64 Tesla at the chamber wall). Results show that a stronger sextuple magnet alone does not automatically improve the source performance.

1387 (SSCL–576-Rev.A) **Fully pipelined and programmable Level 1 trigger: Revision A.** Crosetto, D.; Love, L. Superconducting Super Collider Lab., Dallas, TX (United States). Jul 1992. 73p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC35-89ER40486. Order Number DE93002759. Source: OSTI; NTIS; INIS; GPO Dep.

The types of detectors and the physics involved in present experiments are reaching a level of cost and complexity so great that it is preferable to implement a programmable trigger solution at al levels rather than a system realized with cabled logic. Experience demonstrates that the fine tuning on the trigger is often only achieved after running an experiment and analyzing the first data acquired. Recent advances in technology made real-time programmable algorithms down to the Level 1 trigger feasible. In this report a number of algorithms for the first level trigger have been simulated using one of the most advanced chips available. A fully-pipelined and programmable Level 1 trigger system sustaining a clock rate of 16 ns has been designed based on a modified version of the Data Wave chip.

1388 (SSCL–596) **DCA211 failure analysis report.** Scanlan, R. (Lawrence Berkeley Lab., CA (United States)); Arden, C. Superconducting Super Collider Lab., Dallas, TX (United States). Jun 1992. 36p. Sponsored by USDOE, Washington, DC (United

States). DOE Contract AC35-89ER40486. Order Number DE93002855. Source: OSTI; NTIS; INIS; GPO Dep.

This report contains the findings, conclusions, and recommendations of a committee that was commissioned to investigate the events leading to the burnout of the main power connection to the test stand in dipole magnet DCA211 during tests at Brookhaven National Laboratory (BNL) on April 8, 1992. The report contains an executive summary of the significant findings, conclusions, and recommendations; this summary is followed by a more detailed compilation of reports, calculations, and data that were used by the committee to reach our conclusions.

1389 (SSCL-Preprint–134-Rev.A) **Influence of cable eddy currents on magnetic field harmonics: Revision A.** Ogitsu, T. (Superconducting Super Collider Lab., Dallas, TX (United States)); Zhao, Y.; Akhmetov, A.; Devred, A. Superconducting Super Collider Lab., Dallas, TX (United States). Jul 1992. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC35-89ER40486. (CONF-9206281–1-Rev.A: ICFA workshop on AC superconductivity, Tsukuba (Japan), 23-25 Jun 1992). Order Number DE92040549. Source: OSTI; NTIS; INIS; GPO Dep.

Several SSC 5-cm-aperture, 15-m-long dipole magnet prototypes exhibit anomalous behavior of their magnetic field harmonics during current ramps at 4 A/s. The anomalies cease when the ramp is stopped and the current is held constant. The magnets also exhibit a dramatic degradation of their quench current as a function of ramp rate, as well as large AC-losses. After reviewing the AC-performance of the anomalous magnets, we develop a model of cable eddy currents, which can simulate the observed field behavior and the measured AC-losses, and which is consistent with the quench start localization of the high ramp-rate quenches.

1390 (SSCL-Preprint–140) **Cold mass mechanical design, quench and mechanical test results for full length 50 mm aperture SSC model dipoles built at BNL.** Goodzeit, C. (Superconducting Super Collider Lab., Dallas, TX (United States)); Radusewicz, P.; Anerella, M.; Cottingham, J.; Ganetis, G.; Garber, M.; Ghosh, A.; Greene, A.; Gupta, R.; Jain, A.; Kahn, S.; Kelly, E.; Morgan, G.; Muratore, J.; Prodell, A.; RSuperconducting Super Collider Lab., Dallas, TX (United States). Jul 1992. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC35-89ER40486. Order Number DE93000560. Source: OSTI; NTIS; INIS; GPO Dep.

A series of seven 50 mm aperture, 15-meter long dipole magnets was built and assembled at Brookhaven National Laboratory (BNL). Their design embodies features for evaluation for the final selection of the design for the SSC Collider dipole magnets. This paper discusses mechanical design of the cold mass and presents test results such as quench histories and mechanical parameters during construction and testing.

4304 Storage Rings

1391 (IYaF–90-135) **Synchrotron radiation sources and development of wigglers and ondulators in Novosibirsk.** Kulipanov, G.N. AN SSSR, Novosibirsk (Russian Federation). Inst. Yadernoj Fiziki. 1991. 40p. (In Russian). Order Number DE93605731. Source: OSTI; NTIS (US Sales Only); INIS.

Characteristics are presented and features of the existing electron and positron storage rings sources. Prospects of SR source development are considered, new project possibilities are discussed: the Sibir-3 based on the 10 GeV energy storage wing and the Sibir-4 based on the 2.4 GeV energy storage ring with superconducting and the ones based on the permanent a magnets are described. Various setup schemes and variants of applying Wigglers and ondulators on synchrotron radiation sources and in a free electron optical klystron are considered. 40 refs.; 11 tabs.

1392 (IYaF–90-142) **Technical solution of the asymmetric B-factory final focus.** Vlasov, A.M.; Dubrovin, A.N.; Zholents, A.A. AN SSSR, Novosibirsk (Russian Federation). Inst. Yadernoj Fiziki. 1991. 21p. (In Russian). Order Number DE93605732. Source: OSTI; NTIS (US Sales Only); INIS.

The paper describes the final beam focusing system of asymmetric 6.5X4.3 GeV B-factory. Principal unit assembling order is given in details. 21 refs.

1393 (IYaF–91-6) **Orbital motion calculation using Lie method in collider nonlinear magnetic field.** Ehjdel'man, Yu.I.; Yakimenko, V.E. AN SSSR, Novosibirsk (Russian Federation). Inst. Yadernoj Fiziki. 1991. 31p. (In Russian). Order Number DE93605733. Source: OSTI; NTIS (US Sales Only); INIS.

The orbital motion calculation using Lie method in collider nonlinear magnetic field Lie operator method to solving the orbital motion equation charge particle in nonlinear field of collider is obtained. The first four orders of orbital motion hamiltonian series are obtained. 6 refs.

1394 (IYaF–91-77) **Physics and engineering of high brightness synchrotron radiation sources - its future.** Kulipanov, G.N.; Mezentsev, N.A.; Skrinskij, A.N. AN SSSR, Novosibirsk (Russian Federation). Inst. Yadernoj Fiziki. 1991. 18p. (In Russian). Order Number DE93605734. Source: OSTI; NTIS (US Sales Only); INIS.

Various tendencies in creating synchrotron radiation sources are discussed. Analysis of various means of increasing the brightness, the choice of which is determined on the base of a compromise between the radiation user requirements on the one hand, and accelerating and economic requirements, on the other. New experimental capabilities of 6-100 GeV storage rings, available, are developed or produced in various countries. Physical and technical problems related to the creation of such storage rings are considered. 10 refs.; 6 figs.; 3 tabs.

1395 (IYaF–91-79) **Damping ring for a linear collider.** Mikhajlichenko, A.A.; Parkhomchuk, V.V. AN SSSR, Novosibirsk (Russian Federation). Inst. Yadernoj Fiziki. 1991. 47p. (In Russian). Order Number DE93605735. Source: OSTI; NTIS (US Sales Only); INIS.

Successful operation of any linear collider requires injection of bunches with minimal transverse emittance. The damping ring is used as injector, where phase volume decreases due to synchrotron radiation. There are lot of investigations about possibilities of obtaining such low emittance bunches in damping rings. In this paper the new results of investigations of high intensity bunches with extremely low vertical emittance is represented. There is shown, that for obtaining small vertical emittance it is necessary to increase the energy of the damping ring compatible to proposed projects. This is necessary due to significant input of Touchek-effect into vertical emittance. 48 refs.; 10 figs.; 2 tabs.

1396 (LBL–32537) **Transverse feedback in a 100 TeV storage ring.** Lambertson, G. Lawrence Berkeley Lab., CA (United States). Jun 1992. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00098. (CONF-9211105–1: Maximizing luminosity of hadron colliders at 100 TeV, Erice (Italy), 13-19 Nov 1992). Order Number DE93001571. Source: OSTI; NTIS; INIS; GPO Dep.

The general purpose for a transverse feedback system in the proton collider is to stabilize coherent bunch motions and reduce them to a small amplitude that will result in an acceptable diffusion rate into incoherent motion. Strong instabilities are expected to be caused by the resistive-wall impedance of the beam tubes in pulsed magnets at the low revolution frequency. The feedback must stabilize thousands of coupled-bunch modes. It must also damp excursions of the injected beam and suppress excitations from noise in magnetic fields, in support structures, and in the feedback circuits. It may also be important in combating some beam-beam interaction effects. Damping by synchrotron radiation will be important in the long-term evolution of the emittance, but it is too weak to be a factor in the coherent damping.

44 INSTRUMENTATION

4401 Radiation Instrumentation

1397 (ANL/CP–77200) **Comparison of SANS instruments at reactors and pulsed sources.** Thiyagarajan, P. (Argonne National Lab., IL (United States)); Epperson, J.E.; Crawford, R.K.; Carpenter, J.M.; Hjelm, R.P. Jr. Argonne National Lab., IL (United States). [1992]. 20p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-9209225–1: International seminar on structural investigation at pulsed neutron sources, Dubna (Russian Federation), 1-4 Sep 1992). Order Number DE92041120. Source: OSTI; NTIS; INIS; GPO Dep.

Small angle neutron scattering is a general purpose technique to study long range fluctuations and hence has been applied in almost every field of science for material characterization. SANS instruments can be built at steady state reactors and at the pulsed neutron sources where time-of-flight (TOF) techniques are used. The steady state instruments usually give data over small q ranges and in order to cover a large q range these instruments have to be reconfigured several times and SANS measurements have to be made. These instruments have provided better resolution and higher data rates within their restricted q ranges until now, but the TOF instruments are now developing to comparable performance. The TOF-SANS instruments, by using a wide band of wavelengths, can cover a wide dynamic q range in a single measurement. This is a big advantage for studying systems that are changing and those which cannot be exactly reproduced. This paper compares the design concepts and performances of these two types of instruments.

1398 (ANL-HEP-TR–92-67) **Response to concerns of the EM review committee.** Hill, N.F.; Guarino, V.; Nasiatka, J. Argonne National Lab., IL (United States). High Energy Physics Div. 1 Aug 1992. 41p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (SDC–92-00299). Order Number DE92041152. Source: OSTI; NTIS; INIS; GPO Dep.

During the technical review of the stacked versus cast Electromagnetic Calorimeter on June 24 at the SSC Laboratory, certain questions were raised about the technical reliability of the cast lead EMC. The committee asked for specific response to the following concerns: (1) Deflections resulting from a structure weakened to accommodate longer shower maximum η strips. (2) Assembly plans and scenarios considering the deflections as outlined in question 1. (3) Compatibility with shower max. (4) Positioning of source tubes. (5) Subsequent to the last review an additional question has been raised about stress levels in the lead/bulkhead connections. We will present responses to each of these questions, and are prepared to answer any additional questions the committee may raise.

1399 (BNL–47329) **High rate, high resolution, two-dimensional gas proportional detectors for x-ray synchrotron radiation experiments.** Smith, G.C.; Yu, B.; Fischer, J.; Radeka, V.; Harder, J.A. Brookhaven National Lab., Upton, NY (United States). Feb 1992. 22p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016. (CONF-920219–6: 6. international wire chamber conference: wire chambers - recent trends and alternative techniques, Vienna (Austria), 17-21 Feb 1992). Order Number DE93001442. Source: OSTI; NTIS; GPO Dep.

Two-dimensional, gas proportional detectors are being developed for use with X-ray synchrotron radiation. Two new types of interpolating cathode structures have been investigated, both of which can operate with a significantly smaller number of readout nodes along each sensing axis than previous cathodes. Lumped parameter delay lines are used as the position encoders. Timing signals from fast, low noise shaping electronics are fed to a new, dual TDC system developed for this purpose. Operating with a clock frequency of 500 MHz, the TDCs have an intrinsic differential non-linearity of 0.1%. The complete system can handle X-ray fluxes in excess of 10^6 per sec without distortion of the position information. A resolution of approximately 100 μm FWHM and differenfial non-linearity of $\pm$4% have been achieved. Application of a detector with active area 10 cm $\times$ 10 cm using synchrotron radiation is described.

1400 (BNL–47906) **The unofficial AMPLEX owner's manual.** Coe, S.D. Brookhaven National Lab., Upton, NY (United States). Aug 1992. 31p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016. Order Number DE93001437. Source: OSTI; NTIS; INIS; GPO Dep.

The AMPLEX chip is an AMPlifying multipLEXing, CMOS technology device. It is an analog signal processor, designed at CERN for use with silicon microstrip detectors. However, its application is not limited to conventional microstrips and it is being used in various detector systems. AMPLEX design goals included modest power consumption and reasonable speed. The main drawback of the chip seems to be a lack of documentation. This report will attempt to fill this void by providing a summary of the properties of the AMPLEX chip, a brief synopsis of how it functions, and most importantly an explanation of how to make it operate in a practical circuit. The information in this paper pertains to the application of the AMPLEX chip to microstrip detectors for the electron beam at Brookhaven National Laboratory's Accelerator Test Facility. Detector design was carried out in the Instrumentation Division. Details of the driving circuit and some information on the inner workings of the AMPLEX chip came directly from CERN and from the paper by E. Beuville et al. The author is in no way connected with CERN, nor is he attempting to promote the AMPLEX chip; he is merely interested in making the chip work and in making it easier for others who might wish the same. Some knowledge of the interior of the chip will help in understanding the process of amplifying and shaping signals, so that is where this paper begins.

1401 (CEAC-R–3-91) **Applichation of the sulphate ceric dosimetric in the high doses range.** Prieto Miranda, F. (Instituto de Investigaciones para la Industria Alimenticia, La Habana (Cuba)). Comision de Energia Atomica, La Habana (Cuba). 1991 15p. (In Spanish). Order Number DE93603906. Source: OSTI; NTIS (US Sales Only); INIS.

The ceric-cerous dosimetric system is one of the system more employed in the high dose dosimetry. The spectrophotometric procedure to measure the ceric-concentration is an usual analityc method to determine the absorbed dose. On the other hand, due at increase employ of the irradiation process control. In this paper is realized the ceric-cerous dosimetric calibration in the dose range of 0,6 - 5 kGy and the application in the irradiation process control to differents absorbed dose values.

1402 (CRN–92-31) **Realization of nuclear aggregates detector integrated into 4Π counter at S.I.S.** Tezkratt, R. Strasbourg-1 Univ., 67 (France). Centre de Recherches Nucleaires; Strasbourg-1 Univ., 67 (France). Jun 1992. 118p. (In French). Order Number DE93721014. Source: OSTI; NTIS (US Sales Only); INIS.

A new cluster detector composed of ionization chambers and thin plastic scintillation, has been developed as part of the large 4 PI counter of SIS/ESR, in order to explore central collisions of high energy heavy ions. In the first part are reported the definition, description, theoretical and experimental studies and installation on site of this detector. Its expected response has been investigated with the use of GEANT simulation program. Results are presented and discussed in second part. The efficiency of the track reconstruction with plastic wall has been tested. The excitation function measurement of Au+Au system at 100, 150, 250, 400, 600 and 800 A MeV has been realized. The purpose of the last part is the presentation of the first data acquisition. The cluster gauging and the algorithm development of trajectory reconstitution between the cluster detector and plastic scintillator wall are also presented.

1403 (EGG–10617-4104) **Resolution characteristics of an 18-mm proximity-focused MCPI tube under narrow optical gate conditions.** Behnke, A.; Sammons, T.J. EG and G Energy Measurements, Inc., Pleasanton, CA (United States). Amador Valley Operations. [1992]. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC08-88NV10617. (CONF-9209234–1: Society of Photo-Optical Instrumentation Engineers (SPIE) conference, Victoria (Canada), 21-25 Sep 1992). Order Number DE93000692. Source: OSTI; NTIS; GPO Dep.

We have empirically determined that the gating time of an Micro Channel Image Intensifier (MCPI) tube must be about eight times more than the iris time of the tube to prevent spatial resolution degradation. MTF curves were taken under d-c and dynamic gating conditions, from 1.6-μs to 1-ns gate widths on a tube that has an iris time of 1.2 ns. Under d-c conditions, the 50% MTF was 10 lp/mm. At 50% MTF, the resolution remained at 7 lp/mm from 1.6 μs to 20 ns FWHM; when the gate width was reduced to 10 ns, the resolution decreases to 5 lp/mm at 1.2 ns. Test results and the MTF measurement apparatus are discussed.

1404 (EGG–10617-5100) **Millisecond readout CCD camera.** Prokop, M. (EG and G Energy Measurements, Inc., Los Alamos, NM (United States). Los Alamos Operations); McCurnin, T.W.; Stradling, G. EG and G Energy Measurements, Inc., Los Alamos, NM (United States). Los Alamos Operations. [1992]. 15p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC08-88NV10617. (CONF-9209188–5: 20. international congress on high speed photography and photonics, Victoria (Canada), 25-26 Sep 1992). Order Number DE93000694. Source: OSTI; NTIS; GPO Dep.

We have developed a prototype of a fast-scanning CCD readout system to record a 1024 x 256 pixel image and transport the image to a recording station within 1 ms of the experimental event. The system is designed to have a dynamic range of greater than 1000 with adequate sensitivity to read single-electron excitations of a CRT phosphor when amplified by a microchannel plate image intensifier. This readout camera is intended for recording images from oscilloscopes, streak, and framing cameras. The sensor is a custom CCD chip, designed by LORAL Aeroneutronics. This CCD chip is designed with 16 parallel output ports to supply the necessary image transfer speed. The CCD is designed as an interline structure to allow fast clearing of the image and on-chip fast shuttering. Special antiblooming provisions are also included. The camera is designed to be modular and to allow CCD chips of other sizes to be used with minimal reengineering of the camera head.

1405 (GANIL-R–92-07) **Study and implant of a new beam detector at Ganil.** Vignet, J.L. Grand Accelerateur National d'Ions Lourds (GANIL), 14 - Caen (France). 1992. 18p. (In French). Order Number DE93721003. Source: OSTI; NTIS (US Sales Only); INIS.

This report explains the principle, study and installation of a new beam detector implanted at Ganil. This new detector uses the ionization by the beam of residual gas. It is formed of an accelerator (to canalize ions), an amplifier composed of 2 microchannel plates and of localization lattice (strips).

1406 (IN2P3–92-02, pp. 249-308) **Higgs boson detection at hadron colliders.** Froidevaux, D. (European Organization for Nuclear Research, Geneva (Switzerland)). Institut National de Physique Nucleaire et de Physique des Particules (IN2P3), 75 - Paris (France). 1990. (In French). (CONF-9009441–: Summer school of particle physics, Strasbourg (France), 3-7 Sep 1990). In *Where is the Higgs.* 360p. Order Number DE93720939. Source: OSTI; NTIS (US Sales Only); INIS.

This lesson is divided in several parts: a description of future colliders (Large Hadron Collider, Superconducting Super Collider), a study of main Higgs boson decay channels and their background noises (LHC), and finally a survey of experimental consequences of this study for the electron and photon detection at LHC.

1407 (IN2P3–92-02, pp. 309-353) **Radiation detectors at the future p-p collision rings (LHC/SSC).** Mansoulie, B. (CEA Centre d'Etudes Nucleaires de Saclay, 91 - Gif-sur-Yvette (France). Direction des Sciences de la Matiere). Institut National de Physique Nucleaire et de Physique des Particules (IN2P3), 75 - Paris (France). 1990. (In French). (CONF-9009441–: Summer school of particle physics, Strasbourg (France), 3-7 Sep 1990). In *Where is the Higgs.* 360p. Order Number DE93720939. Source: OSTI; NTIS (US Sales Only); INIS.

This lesson is about the technology of future proton collider detectors (conception, realization and use) and about the difficulties encountered (repetition ratio, data quantity and radiation problem). After 3-4 research years, many solutions have been found and are presented.

1408 (INIS-BR–2933, pp. 334) **Superficial passivation of silicon-lithium type semiconductor detector.** Rizzo, P. (Universidade Federal, Rio de Janeiro, RJ (Brazil). Inst. de Fisica); Santos, W.M.S. Sociedade Brasileira de Fisica, Sao Paulo, SP (Brazil). 1991. 201p. (In Portuguese). (CONF-9105355–: 14. national meeting on condensed matter physics, Caxambu (Brazil), 7-11 May 1991). The results of the investigation of absolute spectral sensitivity of an linear photo-diode arrays (the such of kind LF1024-25/2) as an X-ray one-coordinate detectors in the energy range from 7 to 20 keV are presented. The measurements have been carried out with the use synchrotron radiation from VEPP-3M storage ring.

1416 (JINR-13-90-16) **Cast polystyrene plastic scintillator for the hadron calorimeter of the tagged neutrino beam facility.** Kadykov, M.G. (Joint Inst. for Nuclear Research, Dubna (Russian Federation). Lab. of High Energy); Semenov, V.K.; Suzdalev, V.I. Joint Inst. for Nuclear Research, Dubna (Russian Federation). Lab. of High Energy. 1990. 5p. (In Russian). Order Number DE93605867. Source: OSTI; NTIS (US Sales Only); INIS.

Submitted to Prib. Tekh. Ehksp.

The fabrication of cast plastic scintillators from polystyrene granules using a pressautomatic machine is described. Characteristics of the cast scintillators are compared to the samples obtained by other techniques. The results of the comparison demonstrate a high quality of the scintillator plates produced by the casting technique. 8 refs.; 3 figs.; 1 tab.

1417 (JINR-13-90-236) **Comparative characteristics of polystyrene strips with different scintillation fraction.** Gapienko, V.A. (Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Moscow (Russian Federation)); Denisov, A.G.; Golutvina, I.G. Joint Inst. for Nuclear Research, Dubna (Russian Federation). Lab. of High Energy. 1991. 4p. (In Russian). Order Number DE93605868. Source: OSTI; NTIS (US Sales Only); INIS.

The characteristics of 200X10 mm scintillation polystyrene strips were studied. Two scintillators carried in composition, i.e. the first one considered of 1.5% PT+0,1% POPOP, the second considered of 1.5% PT+0,01% DBP. The ratio of the DBP scintillator luminosity to that of the POPOP scintillator is 0.8:1.0. 2 refs.; 2 figs.; 1 tab.

1418 (JINR-18-91-435) **Proton tomograph for the proton therapy facility.** Alekseev, G.I. (AN SSSR, Moscow (Russian Federation). Radiotekhnicheskij Inst.); Ivanov, I.A.; Klenov, G.I. Joint Inst. for Nuclear Research, Dubna (Russian Federation). Lab. of Nuclear Problems. 1991. 12p. (In Russian). Order Number DE93605876. Source: OSTI; NTIS (US Sales Only); INIS.

The new scheme of proton computed tomography for the proton therapy facility at 250 MeV proton synchrotron is proposed. Model measurements of same tomographic systems were made at the LNP JINR phasotron. The narrow 250 MeV proton beam was formed and its widening by multiple Coulomb scattering in water was measured. A possibility of proton tomographic device creation at 250 MeV beam for clinical use was proved. 12 refs.; 7 figs.

1419 (JINR-E-10-91-161) **Parallel encoders for pixel detectors.** Nikityuk, N.M. Joint Inst. for Nuclear Research, Dubna (Russian Federation). Lab. of High Energy. 1991. 12p. Order Number DE93605861. Source: OSTI; NTIS (US Sales Only); INIS.

A new method of fast encoding and determining the multiplicity and coordinates of fired pixels is described. A specific example construction of parallel encodes and MCC for n=49 and t=2 is given. 16 refs.; 6 figs.; 2 tabs.

1420 (JINR-E-10-91-361) **Track reconstruction in discrete detectors.** Chernov, N.I.; Kisel', I.V.; Korenchenko, S.M.; Ososkov, G.A. Joint Inst. for Nuclear Research, Dubna (Russian Federation). Lab. of Computing Techniques and Automation. 1991. 12p. Order Number DE93605862. Source: OSTI; NTIS (US Sales Only); INIS.

The probabilistic and geometrical analysis is given for data from experimental facilities like multiwire proportional chambers or strip detectors. The theoretical study showed that taking into account the discrete nature of data gives the accuracy of track reconstruction $\sqrt{N}$ better as compared with conventional least square fitting (here N is the number of measurements). For an idealized straight track model a simple, handy and fast algorithm is proposed for track reconstruction. It is modified to the case of circular tracks. 4 refs.; 9 figs.

1421 (JINR-R-1-91-42) **The device switching on spark gaps at the SLON setup.** Buriev, N.T. (Tadzhikskij Gosudarstvennyj Univ., Dushanbe (Tajikistan)); Kaplin, V.I.; Kovalenko, A.D. Joint Inst. for Nuclear Research, Dubna (Russian Federation). Lab. of High Energy. 1991. 4p. (In Russian). Order Number DE93605863. Source: OSTI; NTIS (US Sales Only); INIS.

The device switching on triggered spark gaps at the setup SLON is described. The parameters of switching pulses are the following: pulse duration - 30 ms, maximum amplitude - 10 KV, switching current - 1 kA, increasing time - 2-3 ms. The main properties of the device are stability safety and it does not make hindrances to other systems. 2 refs.; 3 figs.

1422 (JINR-R-3-91-172) **Neutron Fourier diffractometer at the IBR-2 reactor.** Aksenov, V.L. (Joint Inst. for Nuclear Research, Dubna (Russian Federation). Lab. of Nuclear Problems); Balagurov, A.M.; Antson, O. Joint Inst. for Nuclear Research, Dubna (Russian Federation). Lab. of Nuclear Problems. 1991. 14p. (In Russian). Order Number DE93605849. Source: OSTI; NTIS (US Sales Only); INIS.

The project of neutron high resolution Fourier diffractometer (HRFD) at the IBR-2 reactor is described. The expected parameters of HRFD are considered together with parameters of the best present day facilities. The general outline of the physical problems suitable for HRFD are also given. 15 refs.; 4 figs.; 2 tabs.

1423 (JINR-R-10-90-553) **A program-controlling distribution of high voltage in CAMAC standard.** Kadykov, M.G.; Shchelev, A.S.; Yarygin, G.A. Joint Inst. for Nuclear Research, Dubna (Russian Federation). 1990. 5p. (In Russian). Order Number DE93605864. Source: OSTI; NTIS (US Sales Only); INIS.

The description of a program-controlling 16-channels splitter of high voltage for spectrometers is presented. The designed device is mounted in two-width CAMAC module. The range of regulation is 500-3000 V with load current 1 mA and stability ± 1 V. 4 refs.; 1 fig.

1424 (JINR-R-10-91-147) **Number detector coding device for investigations on pulsed reactors by the time-of-flight method.** Novozhilov, V.E. Joint Inst. for Nuclear Research, Dubna (Russian Federation). Lab. of High Energy. 1991. 6p. (In Russian). Order Number DE93605847. Source: OSTI; NTIS (US Sales Only); INIS.

The CAMAC device for number detector coding in time-of-flight experiments on pulsed reactors is described. The device connected with the time-to-digital converter allows one to register time-of-flight spectra for each detector with a maximum number of channels from 128 up to 4096 and the channel width from 0,5 μs and more. 7 refs.; 2 figs.

1425 (JINR-R-10-91-444) **Applications of discrete transformations in the problem of preliminary data processing for experiments in high energy physics.** Ososkov, G.A. (Joint Inst. for Nuclear Research, Dubna (USSR). Lab. of Computing Techniques and Automation); Pospelov, A.S. Joint Inst. for Nuclear

Research, Dubna (Russian Federation). Lab. of Computing Techniques and Automation. 1991. 10p. (In Russian). Order Number DE93605865. Source: OSTI; NTIS (US Sales Only); INIS.

It is assumed that charged particle tracks detected in N coordinate planes are described by the linear model with S parameters. A method for the track-candidate selection is proposed. The corresponding algorithm requires (N-S) operations per every test and suites for hardware implementation. Results of numerical experiments are given, with show the satisfactory method reliability. 7 refs.; 1 tab.

1426 (JINR-R–10-91-463) **The device for coding the position in position sensitive detectors on the basis of the flash ADC.** Zen En Ken; Novozhilov, V.E.; Tishin, V.G. Joint Inst. for Nuclear Research, Dubna (Russian Federation). Lab. of Nuclear Problems. 1991. 6p. (In Russian). Order Number DE93605848. Source: OSTI; NTIS (US Sales Only); INIS.

Two devices for coding the position in position sensitive detectors implemented on the basis of the monolithic flash ADC are described. The time of position coding is 0.5 μs. 6 refs.; 3 figs.

1427 (JINR-R–13-90-452) **Electronic equipment for selection of events in experiments on muon-catalyzed nuclear fusion reactions.** Gilev, A.I.; Ivanovskij, S.A.; Zinov, V.G.; Rudenko, A.I.; Selikov, A.V. Joint Inst. for Nuclear Research, Dubna (Russian Federation). Lab. of Nuclear Problems. 1991. 8p. (In Russian). Order Number DE93605866. Source: OSTI; NTIS (US Sales Only); INIS.

A trigger part of the electronic equipment used in experiments on muon-catalyzed nuclear fusion reactions in a mixture of hydrogen isotopes is described. The main units of the trigger electronics are: a unit for separation of muon stops in the target and determination of the detection interval (a 10μs gate signal), it switches on the system of protection against double particles of the beam; a unit that determines the criterion of a useful event. The units are made to the standard of CAMAC modules of the double width. 12 refs.; 4 figs.

1428 (LA–12379-MS) **Directional fast-neutron detectors.** Garnett, A. (ed.); Byrd, R.C. Los Alamos National Lab., NM (United States). Oct 1992. 38p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. Order Number DE93000355. Source: OSTI; NTIS; INIS; GPO Dep.

Because neutrons are uncharged, neutron detectors must usually employ massive shielding in order to provide narrow angular resolution or to reduce the effect of backgrounds incident from different directions. If a detector is divided into multiple elements, the differences in count rate between different segments can indicate the direction of the incident neutron flux or provide corrections that cancel out the detector's response in certain directions. This report presents several calculations for this "active" collimation, which requires the use of much less shielding material than comparable passive approaches. Included are calculations for well-shielded detectors whose response is nonzero only over a narrow angular range, lightly shielded detectors whose response is zero over the entire rear hemisphere, and unshielded detectors that can accurately determine the direction of a suspected neutron source. These calculations are compared with available measurements and are in good-to-excellent agreement.

1429 (LA–12412-MS) **Liquid-scintillator stabilization with an internal ^{137}Cs source.** Miller, D.W. (Los Alamos National Lab., NM (United States)); Russo, P.A.; Ensslin, N.; Hurlbut, C. Los Alamos National Lab., NM (United States). Oct 1992. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. Order Number DE93000505. Source: OSTI; NTIS; GPO Dep.

A stabilization option has been examined for a prototype fast-neutron multiplicity counter that combines liquid scintillators and pulse-shape-discrimination circuitry. The fast-neutron counter has been found to exhibit long-term instability over the range of $\pm$10%. A new liquid scintillator with an internal ^{137}Cs source has been fabricated and tested to see if the source spectrum can be used for stabilization. This paper describes the design and testing of the new fast-neutron detector and scintillator.

1430 (LA-UR–92-3150) **Data acquisition system for the Large Scintillating Neutrino Detector at Los Alamos.** Anderson, G. (Linfield Coll., McMinnville, OR (United States)); Cohen, I.; Homann, B.; Smith, D.; Strossman, W.; VanDalen, G.J.; Weaver, L.S.; Evans, D.; Vernon, W.; Band, A.; Burman, R.; Chang, T.; Federspiel, F.; Foreman, W.; Gomulka, S.; Hart, G.; KozloLos Alamos National Lab., NM (United States). [1992]. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-920966–2: 10. conference on computing in high energy physics, Annecy (France), 21-25 Sep 1992). Order Number DE93000700. Source: OSTI; NTIS; INIS; GPO Dep.

The data acquisition system for the Large Scintillating Neutrino Detector (LSND) is described. The system collects time and charge information in real time from 1600 photomultiplier tubes and passes the data in intelligent-trigger selected time windows to analysis computers, where events are reconstructed and analyzed as candidates for a variety of neutrino-related physics processes. The system is composed of fourteen VME crates linked to a Silicon Graphics, Inc. "4D/480" multiprocessor computer through multiple, parallel Ethernets, and a collection of contemporary high-performance workstations.

1431 (LBL–32347) **A neutron dose detector with REM response to 1 GeV.** Sun, R.K. (Lawrence Berkeley Lab., CA (United States)); Krebs, G.F.; Smith, A.R.; Hsu, H.H. Lawrence Berkeley Lab., CA (United States). Jul 1992. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00098. (CONF-921102–20: Joint American Nuclear Society (ANS)/European Nuclear Society (ENS) international meeting on fifty years of controlled nuclear chain reaction: past, present, and future, Chicago, IL (United States), 15-20 Nov 1992). Order Number DE92041203. Source: OSTI; NTIS; GPO Dep.

The limitation of current remmeters, which do not measure neutron dose equivalents above about 15 MeV, is a serious problem at high-energy accelerator facilities, where a much wider range of neutron energies exist. The purpose of this work was to measure the response of a modified Anderson-Braun (A-B) remmeter to neutron energies up to 1 GeV. The modifications to the standard A-B remmeter were based on the experimental results of Pb(n,xn) reactions.

1432 (LBL–32526) **The UCLA Phi Factory detector, the integration of superconducting compensation solenoids and the final focus interaction region quadrupoles.** Green, M.A. (Lawrence Berkeley Lab., CA (United States)); Cline, D.B. Lawrence Berkeley Lab., CA (United States). Jun 1992. 4p. Sponsored by USDOE, Washington, DC (United States); National Aeronautics and Space Administration, Washington, DC (United States). DOE Contract AC03-76SF00098. (SC-MAG–388;CONF-920614–3: International cryogenic engineering conference and the international cryogenic materials conference, Kiev (Ukraine), 8-12 Jun 1992). Order Number DE92041179. Source: OSTI; NTIS; INIS; GPO Dep.

The proposed Phi Factory for the University of California at Los Angeles (UCLA) is a small 510 MeV electron-positron colliding beam storage ring with high luminosity (greater than 10^{32} CM^{-2} S^{-1}). In order to do high quality Phi physics, a particle detector system with a large solid angle (preferably greater than 98 percent) is required. Particle detection and analysis will be done within a 0.5 tesla solenoidal magnetic field. The solenoidal field within the detector causes coupling between beam oscillations in the horizontal and vertical directions. Therefore, compensation solenoids are required to keep the circulating particle beams from seeing the effects of the field from the main detector solenoid. Since high luminosity and a large solid angle are required, the detectors and a pair of compensation solenoids must be integrated with the final focus quadrupoles within the detector straight section. This report describes the design of two tapered, 0.5 tesla, superconducting compensation solenoids which must go around six rare earth permanent final focus quadrupoles or six superconducting quadrupoles on either side of the beam collision point. A cryogenic cooling system for these two solenoids, which will be coupled with the cooling system for the primary detector solenoid, is also described.

1433 (LBL-PUB–5347) **Conceptual design report for the Solenoidal Tracker at RHIC.** The STAR Collaboration. Lawrence

Berkeley Lab., CA (United States). 15 Jun 1992. 359p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00098. Order Number DE92041174. Source: OSTI; NTIS; INIS; GPO Dep.

The Solenoidal Tracker At RHIC (STAR) will search for signatures of quark-gluon plasma (QGP) formation and investigate the behavior of strongly interacting matter at high energy density. The emphasis win be the correlation of many observables on an event-by-event basis. In the absence of definitive signatures for the QGP, it is imperative that such correlations be used to identify special events and possible signatures. This requires a flexible detection system that can simultaneously measure many experimental observables. The physics goals dictate the design of star and it's experiment. To meet the design criteria, tracking, momentum analysis, and particle identification of most of the charged particles at midrapidity are necessary. The tracking must operate in conditions at higher than the expected maximum charged particle multiplicities for central Au + Au collisions. Particle identification of pions/kaons for $p < 0.7$ GeV/c and kaons/protons for $p < 1$ GeV/c, as well as measurement of decay particles and reconstruction of secondary vertices will be possible. A two-track resolution of 2 cm at 2 m radial distance from, the interaction is expected. Momentum resolution of $\Delta p/p \sim 0.02$ at $p = 0.1$ GeV/c is required to accomplish the physics, and,$\Delta p/p$ of several percent at $p = 10$ GeV/c is sufficient to accurately measure the rapidly failing spectra at high Pt and particles from mini-jets and jets.

1434 (NIKHEF-K-EMIN–92-01) **Efficiency calculations of the hadron detector.** Spreckelsen, Paul von. Nationaal Inst. voor Kernfysica en Hoge-Energiefysica (NIKHEF), Amsterdam (Netherlands). Sectie K. Nov 1991. 21p. Order Number DE93603917. Source: OSTI; NTIS; INIS.

At NIKHEF-K 2 plastic scintillator detectors (hadron detectors), box1 and box2, were developed for (e,e'pp) reactions. They were in operation during the summers of 1989 and 1990. These hadron detectors combine a large solid angle (approximately 40 msr) with large momentum acceptance. They were designed to detect protons emitted in energy range 25-158MeV and 37-198MeV, respectively. Both detectors are highly segmented in order to cope with the high singles count rate, which is expected. Since these hadron detectors are of a new type, little is known about their performance. This report describes the methods followed to find out (where possible) the efficiency of each element of one of the detectors. Moreover, for some elements the energy dependency of the efficiency was also examined. The presented calculations were done with data from box1, positioned at a scattering angle, θ, of 120deg. (author). 2 refs.; 5 figs.; 6 tabs.

1435 (RAL–92-031) **The high resolution powder diffractometer (HRPD) at ISIS - a user guide.** Ibberson, R.M.; David, W.I.F.; Knight, K.S. Rutherford Appleton Lab., Chilton (United Kingdom). May 1992. 38p. Order Number DE93603984. Source: OSTI; NTIS (US Sales Only); INIS.

Version 2.1.

This guide is intended to give a short description of the High Resolution Powder Diffractometer, HRPD, at ISIS and to provide the basic information required in order to perform a routine powder diffraction experiment. (Author).

1436 (RAL–92-032) **Profile analysis of neutron powder diffraction data at ISIS.** David, W.I.F.; Ibberson, R.M.; Matthewman, J.C. Rutherford Appleton Lab., Chilton (United Kingdom). May 1992. 40p. Order Number DE93603985. Source: OSTI; NTIS (US Sales Only); INIS.

The aim of this manual is to document the current suite of time-of-flight neutron powder diffraction profile refinement programs available to ISIS users. Aspects of data collation and normalisation specific to the individual diffraction instruments are dealt with elsewhere. It will be assumed the user has produced a suitable data file (.DAT file) containing the profile data consisting of point by point values of the corrected diffraction profile across the pattern. The analysis of neutron powder diffraction data at ISIS by profile refinement utilises a suite of "in-house" written and supported programs based on the Cambridge Crystallography Subroutine Library (CCSL). A quick scan through the CCSL manual will give the user a general feel for the procedure to adopt in the use of the library and hence of the profile codes. The instructions documented in this handbook are complementary to those in the more specialist CCSL manual, and consequently go into no great detail regarding technical details of any of the CCSL routines. The programs may be run from each individual user account, for example [USER01], once the appropriate login procedure has been set-up by the instrument scientists. The programs are mostly activated by one line commands and only a basic knowledge of a VAX editor should be required; details can be found in the "VAX primer" available from Computer Support. (Author).

1437 (SINS–2106/A, pp. 80-83) **The cluster counter as a part of the 4-facility at SIS/ESR.** Tezkratt, R. (Strasbourg-1 Univ., 67 (France). Centre de Recherches Nucleaires); Cerruti, C.; Coffin, J.P.; Fintz, P.; Guillaume, G.; Jundt, F.; Maguire, C.F.; Rami, F.; Wagner, P. Institute of Atomic Energy, Otwock-Swierk (Poland). Nov 1990. (CONF-900857–: 21. Mikolajki summer school on nuclear physics: nuclear and atomic physics with accelerators of the nineties, Mikolajki (Poland), 26 Aug - 5 sep 1990). In *Nuclear and atomic physics with the accelerators of the nineties: Proceedings of the 21st Mikolajki summer school on nuclear physics, held in Mikolajki, Poland, August 26 - September 5, 1990. Seminars.* 111p. Order Number DE93604421. Source: OSTI; NTIS (US Sales Only); INIS.

A cluster detector composed of ionization chambers and thin plastic scintillators has been developed as part of the large 4π-detector at SIS/ESR. (author).

1438 (SINS–2106/A, pp. 84-88) **TAPS - a two arm photon spectrometer for the detection of neutral mesons and single photons.** Pfeiffer, M. (Giessen Univ. (Germany). 2. Physikalisches Inst.). TAPS-Collaboration. Institute of Atomic Energy, Otwock-Swierk (Poland). Nov 1990. (CONF-900857–: 21. Mikolajki summer school on nuclear physics: nuclear and atomic physics with accelerators of the nineties, Mikolajki (Poland), 26 Aug - 5 sep 1990). In *Nuclear and atomic physics with the accelerators of the nineties: Proceedings of the 21st Mikolajki summer school on nuclear physics, held in Mikolajki, Poland, August 26 - September 5, 1990. Seminars.* 111p. Order Number DE93604421. Source: OSTI; NTIS (US Sales Only); INIS.

A photon-spectrometer for the detection of neutral mesons and single photons has been built. It will be used at several facilities to study heavy ion (GSI and GANIL) and photon induced (MAMI B) reactions. The spectrometer consists at present of 4 blocks with 64 BaF_2-scintillation detectors each. The blocks are arranged in two movable towers to provide a flexible geometry. The spectrometer has been recently used for a first experiment (350 MeV/u ^{20}Ne on ^{27}Al) at GSI. Preliminary results from this run will be presented. (author).

1439 (SINS–2106/A, pp. 89-102) **In-beam electron spectroscopy with collinear geometry.** Dionisio, J.S. (Paris-11 Univ., 91 - Orsay (France). Centre de Spectrometrie Nucleaire et de Spectrometrie de Masse); Meliani, Z.; Schuech, C.; Vieu, Ch. Institute of Atomic Energy, Otwock-Swierk (Poland). Nov 1990. (CONF-900857–: 21. Mikolajki summer school on nuclear physics: nuclear and atomic physics with accelerators of the nineties, Mikolajki (Poland), 26 Aug - 5 sep 1990). In *Nuclear and atomic physics with the accelerators of the nineties: Proceedings of the 21st Mikolajki summer school on nuclear physics, held in Mikolajki, Poland, August 26 - September 5, 1990. Seminars.* 111p. Order Number DE93604421. Source: OSTI; NTIS (US Sales Only); INIS.

The basic relations for the Doppler shift and Doppler broadening of an electron line given by an electron spectrometer oriented in the collinear geometry are discussed in detail. The main features of the in-beam e-γ spectrometer recently operated with direct collinear geometry (i.e. with $20 \geq \alpha \geq 10$ deg) at Orsay's MP Tandem accelerator are briefly described. The interesting performances of that instrument for the investigation of prompt and short delayed low energy transitions ($E_\gamma \leq 200$ keV) deexciting nuclear high spin states are illustrated with a few typical examples. Further developments with reverse collinear geometry (i.e. with 170 deg $\geq \alpha \geq$ 160 deg) are also shortly discussed in the present context of nuclear structure studies involving in-beam nuclear spectroscopic measurements. (author).

1440 (SLAC-PUB–5927) **FAD: A full-acceptance detector for physics at the SSC.** Bjorken, J.D. Stanford Linear Accelerator Center, Menlo Park, CA (United States). Sep 1992. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00515. (CONF-9206284–1: 7. international symposium on very high energy cosmic ray interactions, Ann Arbor, MI (United States), 21-27 Jun 1992). Order Number DE93001765. Source: OSTI; NTIS; INIS; GPO Dep.

For high energy pp collisions, the concepts "4π" and "full acceptance" are distinct. At the SSC, the appropriate variables for describing phase space are the lego variables: pseudorapidity η and azimuthal angle ϕ. While most of 4π is covered by pseudorapidities less than 3 or 4 in magnitude, at the SSC there is very interesting physics out to η's of 9 to 12. For over a year I have been attempting to encourage an initiative at the SSC to provide a detector which could cover the missing acceptance of the two big detectors, which in particular have no appreciable charged particle tracking with good momentum resolution beyond rapidities of 2.5 or so. The nonnegotiable criteria for an FAD are for me the following: 1. All charged particles are seen and their momenta measured well, provided pt is not too large. 2. All photons are seen and their momenta are measured well. 3. The physics of rapidity-gaps is not compromised. This means angular coverage from 90° down to tens of microradians. The above criteria cannot be met on day one of SSC commissioning with the amount of funds available. But I believe a staged approach is feasible, with a lot of interesting physics available along the way. The basic philosophy underlying the FAD idea is that it should first and most be a survey instrument, sensitive to almost everything, but optimized for almost nothing. Its strength is in the perception of complex patterns individual events, used as a signature of new and/or interesting physics. Examples of such patterns will be given later.

1441 (UCRL-JC–109349) **Microchannel plate intensifier gain uniformity improvement in sealed tubes by selective scrubbing.** Thomas, S. (Lawrence Livermore National Lab., CA (United States)); Behnke, A. Lawrence Livermore National Lab., CA (United States). Aug 1992. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-9209188–4: 20. international congress on high speed photography and photonics, Victoria (Canada), 25-26 Sep 1992). Order Number DE92041082. Source: OSTI; NTIS; GPO Dep.

We have improved the gain uniformity of sealed microchannel plate image intensifiers (MCPIs) by selectively scrubbing the high gain sections with a controlled bright light source. The major contributor to poor uniformity on most of the tubes we have tested is the cathode, with the MCP and screen making only minor contributions. Using the premise that ions returning to the cathode from the MCP damage the cathode and reduce its sensitivity, we raster scanned an HeNe laser beam light source across the cathode of an MCPI tube. Cathode current was monitored and when it exceeded a present threshold, the sweep rate was decreased 1000 times, giving 1000 times the exposure to cathode areas with sensitivity greater than the threshold. The threshold was set at the cathode current corresponding to the lowest sensitivity in the active cathode area so that sensitivity of the entire cathode would be reduced to this level. This process reduced tube gain by between 10% and 30% in the high gain areas while gain reduction in low gain areas was negligible. Effects on cathode spectral sensitivity and phosphor efficiency, the results of including the MCP in the feedback loop, the possibility of reclaiming tubes damaged by prolonged exposure to resolution targets, and circuit details are discussed.

1442 (UCRL-JC–111225) **High sensitivity external modulator data link for high energy particle detector diagnostics.** McCammon, K. (Lawrence Livermore National Lab., CA (United States)); Lowry, M.; Wuest, C.; McConaghy, C.; Yuanhann Chang; Wyslouch, B.; Becker, U.; Parker, P. Lawrence Livermore National Lab., CA (United States). May 1992. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-9205210–3: 2. annual conference on electronics for future colliders, Chestnut Ridge, NY (United States), 19-21 May 1992). Order Number DE92041084. Source: OSTI; NTIS; GPO Dep.

An analog fiber-optic data link has been demonstrated for direct charge readout of wire chambers used in high energy particle detectors. The fiber link consists of a Nd:YAG laser carrier, a Mach-Zehnder external modulator, and a low-noise optical receiver. A charge pulse developed on a sensing wire flows directly into the electro-optic modulator with no preamplification. The substitution of passive modulators and fiber cable for active electronics and copper wire near large collider detectors has clear advantages with regard to radiation damage susceptibility, EMI immunity, physical size, and power consumption. Also, the modulator performance was unaffected for an applied one Tesla magnetic field. Reduction of noise contributions from the laser carrier and optical receiver and exploitation of the "effective optical gain" properties of external modulators resulted in shot-noise-limited link sensitivity. Modulators were, packaged with large termination resistors enabling increased charge sensitivity with an increased system risetime tradeoff. Energy resolution of the fiber HA was comparable to preamps condidonal on large terminations and subsequent slow readout For shorter risetimes required in timing diagnostics, small terminations resulted in sensitivity 6.8 times inferior to preamps. Several potential improvements in sensitivity are discussed.

1443 (CEA-CONF–10967) **Experimental study of charge collection in PN, NP diodes and MOS capacitor struck by heavy ions.** Patin, Y.; Lochard, J.P.; Gosselin, G. CEA Centre d'Etudes de Bruyeres-le-Chatel, 91 (France). 1991. 4p. (In French). (CONF-9109232–: RADECS 91: radiation effects on components and systems, Montpellier (France), 9-12 Sep 1991). Order Number DE93721210. Source: OSTI; NTIS (US Sales Only); INIS.

Charge collection in PN and silicon diodes and MOS capacitor struck by heavy ions, has been experimentally studied. We have analysed a large set of data obtained at GANIL, Saclay and Bruyeres-le-Chatel accelerators. General laws have been deduced to describe the FUNNELING phenomena as function of circuit polarisation and ion penetration.

1444 (CEA-CONF–11022) **Charge collection mechanisms in MOS/SOI transistors irradiated by energetic heavy ions.** Musseau, O. (CEA Centre d'Etudes de Bruyeres-le-Chatel, 91 (France)); Leray, J.L.; Ferlet, V.; Umbert, A.; Coic, Y.M.; Hesto, P. CEA Centre d'Etudes de Bruyeres-le-Chatel, 91 (France). 1991. 8p. (CONF-910751–: Institute of Electrical and Electronic Engineers (IEEE) annual international nuclear and space radiation effects conference, San Diego, CA (United States), 15-19 Jul 1991). Order Number DE93721142. Source: OSTI; NTIS (US Sales Only); INIS.

We have investigated with both experimental and numerical methods (Monte Carlo and drift-diffusion models) various charge collection mechanisms in NMOS/SOI transistors irradiated by single energetic heavy ions. Our physical interpretations of data emphasize the influence of various parasitic structures of the device. Two charge collection mechanisms are detailed: substrate funneling in buried MOS capacitor and latching of the parasitic bipolar transistor. Based on carrier transport and charge collection, the sensitivity of future scaled down CMOS/SOI technologies is finally discussed.

1445 (CEA-CONF–11023) **Semi-empirical modelization of charge funneling in a NP diode.** Musseau, O. CEA Centre d'Etudes de Bruyeres-le-Chatel, 91 (France). 1991. 5p. (In French). (CONF-9109232–: RADECS 91: radiation effects on components and systems, Montpellier (France), 9-12 Sep 1991). Order Number DE93721143. Source: OSTI; NTIS (US Sales Only); INIS.

Heavy ion interaction with a semiconductor generates a high density of electrons and holes pairs along the trajectory and in a space charge zone the collected charge is considerably increased. The chronology of this charge funneling is described in a semi-empirical model. From initial conditions characterizing the incident ion and the studied structure, it is possible to evaluate directly the transient current, the collected charge and the length of funneling with a good agreement. The model can be extrapolated to more complex structures.

1446 (CEA-CONF–11024) **Monte Carlo modelling of the effect of an heavy ion on the operation of a MISFET/SOI.** Musseau, O. (CEA Centre d'Etudes de Bruyeres-le-Chatel, 91 (France)); Hesto, P.; Dollfus, P.; Mouis, M. CEA Centre d'Etudes de Bruyeres-le-Chatel, 91 (France). 1991. 5p. (In French). (CONF-9109232–: RADECS 91: radiation effects on components and systems, Montpellier (France), 9-12 Sep 1991). Order Number DE93721144. Source: OSTI; NTIS (US Sales Only); INIS.

Electron-hole pairs are created along the track of an heavy ion, return to the original state of these charge carriers are studied by a Monte Carlo model. The structure studied are MISFET transistors, insulated from the substrate by a buried dielectric. The grid insulating material is silicon nitride and the buried dielectric is Yttria stabilized zirconia. They were chosen because they are more radiation resistant than silicon oxide.

1447 (CEA-CONF–11025) **Effects of X or gamma radiation dose on vitreous silicon oxides and Silicon On Insulator buried oxides by the study of trapped charges and paramagnetic defects.** Leray, J.L. (CEA Centre d'Etudes de Bruyeres-le-Chatel, 91 (France)); Coic, Y.M.; Margail, J.; Devine, R.A.B. CEA Centre d'Etudes de Bruyeres-le-Chatel, 91 (France). 1991. 10p. (In French). (CONF-9109232–: RADECS 91: radiation effects on components and systems, Montpellier (France), 9-12 Sep 1991). Order Number DE93721145. Source: OSTI; NTIS (US Sales Only); INIS.

Silicon On Insulator (SOI-SIMOX) buried oxides and Suprasil silica glasses have been irradiated so as to compare charge trapping and paramagnetic defect center generation phenomena. Parameters used in the study were: X or γ-ray irradiation, and electric field bias applied during irradiation. Positive or negative charge trapping is depending upon the sign of the bias field in the SIMOX (Separation by Implantation of Oxygen) buried MOS structure, and is correlated with E' paramagnetic center generation. In the two cases, the charge trapping mechanism or E' center generation are very sensitive to the electric field magnitude. In the SIMOX oxide, synthesized by oxygen implant, the EPR spectrum is confirmed to exhibit a characteristic 2-peak structure.

1448 (CEA-CONF–11026) **Radiation dose effects, hardening of electronic components.** Dupont-Nivet, E. CEA Centre d'Etudes de Bruyeres-le-Chatel, 91 (France). 1991. 34p. (In French). (CONF-9109232–: RADECS 91: radiation effects on components and systems, Montpellier (France), 9-12 Sep 1991). Order Number DE93721146. Source: OSTI; NTIS (US Sales Only); INIS.

This course reviews the mechanism of interaction between ionizing radiation and a silicon oxide type dielectric, in particular the effect of electron-hole pairs creation in the material. Then effects of cumulated dose on electronic components and especially in MOS technology are examined. Finally methods hardening of these components are exposed. 93 refs.

1449 (JINR-R–7-91-29) **The mathematical modelling of radiation damages of HTSC bolometers.** Barashenkov, V.S.; Polyanski, A.; Sosnin, A.N.; Shmakov, S.Yu. Joint Inst. for Nuclear Research, Dubna (Russian Federation). Lab. of Computing Techniques and Automation. 1991. 2p. (In Russian). Order Number DE93605911. Source: OSTI; NTIS (US Sales Only); INIS.

Variation in performance of HTSC bolometer depending on the type of bombarding particle is investigated by means of Monte Carlo method. It is shown that the heat induced on the HTSC element in respect to one nucleon of a bombarding particle for energies of some GeV/nucleon remains practically invariable. The performance of the bolometer is charged significantly for fluxes of the order of 10^9 protons/cm^{2}xc and up. 1 ref.; 1 tab.

1450 (JINR-R–12-91-433) **Effects of atomic hydrogen on polymeric track detectors.** Apel', P.Yu. (and others); Kuznetsov, V.I.; Luppov, V.G. Joint Inst. for Nuclear Research, Dubna (Russian Federation). Lab. of Nuclear Problems. 1991. 12p. (In Russian). Order Number DE93605910. Source: OSTI; NTIS (US Sales Only); INIS.

The effects of atomic hydrogen on polymeric track detectors were investigated. The detectors in the form of films 8-10 μ thick were beforehand irradiated by xenon ions with an energy of ca. The modelling of the track formation process in terms of this concept can be more successful than the attempts made before based on the calculations of the spatial distribution of the energy deposited by delta electrons. 8 refs.; 3 figs.

1451 (LBL–32500) **Chemistry of radiation damage to wire chambers.** Wise, J. Lawrence Berkeley Lab., CA (United States). Aug 1992. 127p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00098. Order Number DE93000627. Source: OSTI; NTIS; INIS; GPO Dep.

Proportional counters are used to study aspects of radiation damage to wire chambers (wire aging). Principles of low-pressure, rf plasma chemistry are used to predict the plasma chemistry in electron avalanches (1 atm, dc). (1) Aging is studied in CF_4/iC_4H_{10} gas mixtures. Wire deposits are analyzed by Auger electron spectroscopy. An apparent cathode aging process resulting in loss of gain rather than in a self-sustained current is observed in CF_4-rich gases. A four-part model considering plasma polymerization of the hydrocarbon, etching of wire deposits by CF_4, acceleration of deposition processes in strongly etching environments, and reactivity of the wire surface is developed to understand anode wire aging in CF_4/iC_4H_{10} gases. Practical guidelines suggested by the model are discussed. (2) Data are presented to suggest that trace amounts of Freons do not affect aging rates in either dimethyl ether or Ar/C_2H_6. Apparent loss of gain is explained by attachment of primary electrons to a continuously increasing concentration of Freon 11 (CCl_3F) in the counter gas. An increase in the concentration of Freon 11 in dimethyl ether is caused by a distillation process in the gas supply bottle and is a natural consequence of the unequal volatilities of the two compounds.

1452 (SAND–92-2043C) **Radiation hardened nonvolatile memory for space and strategic applications.** Jacunski, M. (Westinghouse Electric Corp., Linthicum, MD (United States). Advanced Technology Div.); Williams, D.; Adams, D.; Bishop, R.; Murray, J.; Jakubczak, J.; Rodriguez, J. Sandia National Labs., Albuquerque, NM (United States). [1992]. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. (CONF-921188–1: Government microcircuit applications conference: microelectronics in the new world order, Las Vegas, NV (United States), 9-12 Nov 1992). Order Number DE93000746. Source: OSTI; NTIS (US Sales Only); GPO Dep.

As system complexity increases, so too do the nonvolatile memory needs for the storage of data and microconic. Electrically erasable programmatic read only memories (EEPROMs) are also the frequent choice for applications which in the past have been satisfied by read only memories (ROMs). For system engineers. the ability to electrically reprogram a system module on the fly is indispensable. Two different modes of operation must be considered when evaluating the radiation hardness of EEPROMS. For ROM applications, little if any programming occurs in the radiation environment, and only the read mode need be considered. Here, the chip must (1) retain the information throughout the irradiation, and (2) maintain the functionality of the peripheral circuits necessary for reading the data. For nonvolatile SRAM type applications, the chip must also function in the write mode during the exposure. Unfortunately, commercial EEPROMs have not kept pace with the aggressive radiation specifications of many space and strategic systems. Several studies indicate that the most popular commercial floating gate (FG) technologies manufactured by Xicor, Atmel, and Seeq fail after total doses of just 4 to 18 Krad(Si) in the read mode and after less than 5 Krad(Si) in the write mode. In fact, the very nature of the commercial FG technology has been shown to be limited to a hardness of less than 100 Krad(Si). This paper describes a 64K EEPROM designed by Sandia National Laboratories (SNL) and manufactured by Westinghouse Electric Corporation (WEC). It is pin for pin compatible with commercial 64K EEPROMS. The nonvolatile memory clement is fabricated with a silicon /oxide / nitride /oxide /semiconductor (SONOS) technology for which 1 Mrad(Si) hardness has been demonstrated. In addition, the CMOS peripheral circuitry has been hardened using techniques developed for Westinghouse's radiation hardened gate array products.

4404 Well Logging Instrumentation

1453 (STRIPA-TR–92-16) **Directional borehole antenna - Theory.** Falk, L. (ABEM, Uppsala (Sweden)). Swedish Nuclear

Fuel and Waste Management Co., Stockholm (Sweden). Feb 1992. 156p. Order Number DE93603986. Source: OSTI; NTIS; INIS.

A directional antenna has been developed for the borehole radar constructed during phase 2 of the Stripa project. The new antenna can determine the azimuth of a strong reflector with an accuracy of about 3 degrees as confirmed during experiments in Stripa, although the ratio of borehole diameter to wavelength is small, about 0.03. The antenna synthesizes the effect of a loop antenna rotating in the borehole from four signals measured in turn by a stationary antenna. These signals are also used to calculate an electric dipole signal and a check sum which is used to examine the function of the system. The theory of directional antennas is reviewed and used to design an antenna consisting of four parallel wires. The radiation pattern of this antenna is calculated using transmission line theory with due regard to polarization, which is of fundamental importance for the analysis of directional data. In particular the multipole expansion of the field is calculated to describe the antenna radiation pattern. Various sources of error, e.g. the effect of the borehole, are discussed and the methods of calibrating the antenna are reviewed. The ambiguity inherent in a loop antenna can be removed by taking the phase of the signal into account. Typical reflectors in rock, e.g. fracture zones an tunnels, may be modelled as simple geometrical structures. The corresponding analysis is described and exemplified on measurements from Stripa. Radar data is nowadays usually analyzed directly on the computer screen using the program RADINTER developed within the Stripa project. An algorithm for automatic estimation of the parameters of a reflector have been tested with some success. The relation between measured radar data and external coordinates as determined by rotational indicators is finally expressed in terms of Euler angles. (au).

1454 (UCRL-JC–111214) **Dual-band infrared imaging applications: Locating buried minefields, mapping sea ice, and inspecting aging aircraft.** Del Grande, N.K.; Durbin, P.F.; Perkins, D.E. Lawrence Livermore National Lab., CA (United States). Sep 1992. 8p. Sponsored by Department of Defense, Washington, DC (United States); Merentutkimuslaitos, Helsinki (Finland). DOE Contract W-7405-ENG-48. (CONF-9207155–1: Quantitative nondestructive evaluation conference, San Diego, CA (United States), 19-24 Jul 1992). Order Number DE93000516. Source: OSTI; NTIS; GPO Dep.

We discuss the use of dual-band infrared (DBIR) imaging for three quantitative NDE applications: location buried surrogate mines, mapping sea ice thicknesses and inspecting subsurface flaws in aging aircraft parts. Our system of DBIR imaging offers a unique combination of thermal resolution, detectability, and interpretability. Pioneered at Lawrence Livermore Laboratory, it resolves 0.2 °C differences in surface temperatures needed to identify buried mine sites and distinguish them from surface features. It produces both surface temperature and emissivity-ratio images of sea ice, needed to accurately map ice thicknesses (e.g., by first removing clutter due to snow and surface roughness effects). The DBIR imaging technique depicts subsurface flaws in composite patches and lap joints of aircraft, thus providing a needed tool for aging aircraft inspections.

1456 (LA-UR–92-3171) **Evaluation of environmentally safe cleaning agents for diamond turned optics.** Theye, L.A.; Day, R.D.; Scott, M. Los Alamos National Lab., NM (United States). Oct 1992. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-9210167–1: Aerospace hazardous material management, St. Louis, MO (United States), 27-29 Oct 1992). Order Number DE93000873. Source: OSTI; NTIS; INIS; GPO Dep.

Ellipsometry has been shown to be an effective method for determining surface cleanliness. It is a quick (a single point measurement can be made in about 10 minutes), relatively easy, and precise method to use in these studies. It does require that the index of refraction be measured independently and that a model based-upon these measurements be developed. This model can be developed in a straightforward manner using a commercial software routine. The data indicate that several of the solvents can be used in place of TCA for cleaning diamond machined copper without sacrificing cleaning ability. Costs must be considered when choosing a solvent, however.

1457 (SAND–91-2871C) **Pulsed holography for hypervelocity impact diagnostics.** Ang, J.A. (Sandia National Labs., Albuquerque, NM (United States)); Hansche, B.D.; Konrad, C.H.; Sweatt, W.C.; Gosling, S.M.; Hickman, R.J. Sandia National Labs., Albuquerque, NM (United States). [1992]. 14p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. (CONF-921162–6: Hypervelocity impact symposium, Austin, TX (United States), 17-20 Nov 1992). Order Number DE92040259. Source: OSTI; NTIS; GPO Dep.

Pulsed holography is being developed to meet two principal objectives. The first objective is to quantify the three dimensional characteristics of hypervelocity impact events, and the second is to provide a diagnostic with the ability to capture high fidelity information for the validation of sophisticated three-dimensional hydrocodes. The holographic system uses a Q-switched, seeded, frequency-doubled Nd-YAG laser which produces 5 ns, 750 mJ, coherent pulses at 532 nm. Holographic images have been captured of the back-surface debris bubble from 4 km/s perforating impacts and crater ejecta from 2 km/s non-perforating impacts. A prototype holographic reconstruction and image analysis system has been assembled that provides the ability to measure the structure and individual particles produced in a hypervelocity impact event. The estimated image resolution of this system is 10 to 20 μm; however, this level of performance has not yet been demonstrated.

1458 (SAND–92-0651C) **Dielectric optical waveguide sensors integrated with GaAs active devices.** Carson, R.F.; Casalnuovo, S.A.; Sinclair, M.B. Sandia National Labs., Albuquerque, NM (United States). [1992]. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. (CONF-9209184–3: The International Society for Optical Engineering (SPIE) meeting, Boston, MA (United States), 8-11 Sep 1992). Order Number DE93000750. Source: OSTI; NTIS; GPO Dep.

Dielectric optical waveguides exhibit properties that are well suited to sensor applications. They have low refractive index and are transparent to a wide range of wavelengths. They can react with the surrounding environment in a variety of controllable ways. In certain sensor applications, its is advantageous to integrate the dielectric waveguide on a semiconductor substrate with active devices. In this work, we demonstrate a tamper sensor based on dielectric waveguides that connect epitaxial GaAs-GaAlAs sources and detectors. The tamper sensing function is by attaching particles of absorbing material with high refractive index to the surface of the waveguides. These absorbers are then attached to a lid or cover, as in an integrated circuit package or multi-chip module. The absorbers attenuate the light in the waveguides as a function of absorber interaction. The absorbers are placed randomly on the waveguides, to form a unique attenuation pattern that is registered by the relative signal levels on the photodetectors. When the lid is moved, the pattern of absorbers changes, altering the photodetector signals. The dielectric waveguide arrangement is applicable to a variety of sensor functions, and can make use of resonant coupling properties between low refractive index dielectric waveguides and high-index absorbing materials.

1459 (UCRL-JC–109606-R1) **Sodium guide star adaptive optics system for astronomical imaging in the visible and near-infrared: Revision 1.** Gavel, D.T. (Lawrence Livermore National Lab., CA (United States)); Morris, J.R.; Vernon, R.G. Lawrence Livermore National Lab., CA (United States). Aug 1992. 3p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-920853–4: Nonlinear optics: materials, fundamentals, and applications, Maui, HI (United States), 17-21 Aug 1992). Order Number DE92041081. Source: OSTI; NTIS; GPO Dep.

We are building an adaptive-optic telescope system that is based on the use of an artificial guide star created by laser-induced fluorescence of the sodium mesospheric layer. This paper discusses the system design for mid-visible to near-infrared compensation of a one meter telescope at Livermore and near-infrared compensation of the ten meter Keck telescope at Mauna Kea. We calculate the expected Strehl ratio and resolution for a 69 channel deformable mirror system and also for a possible 24 channel system upgrade. With the 69 actuator system we expect near diffraction limited resolution, about 0.2 arcsec, with a Strehl ratio of about 0.5 at γ=0.8 μm on the 1m telescope, and resolution of about 0.05 arcsec with a Strehl ratio of about 0.5 at γ=2.0 μm on the 10m telescope. Resolution will be limited by the performance of the tip/tilt correction loop, which uses an off-axis natural guide star as a reference. At Livermore, our design uses an existing high power (1 kW) laser source, which is expected to provide an approximately 6th magnitude artificial guide star. This strong beacon signal allows a short integration time in the wavefront sensor so that temporal changes in the atmospheric turbulence can be tracked accurately. For Mauna Kea, we explore how the system to be built for the Livermore site would perform in the infrared, assuming a 100 W laser source.

1460 (ANL/EAIS/TM–70-Vol.1) **Summary of requirements collected and prototype systems developed by Argonne National Laboratory in support of the SOFPARS Program: Volume 1, Overview of SOFPARS requirements.** Peerenboom, J.P.; Baines, T.B.; Braun, M.D.; Cortese, D.L.; Crowe, C.M.; Fuja, R.S.; Greene, R.J.; Gregor, R.A.; Kavicky, J.A.; Love, R.J.; Macal, C.M.; Nevins, M.R.; Paddock, R.A.; Ramsey, G.M.; Roberson, C.F.; Robinson, G.L.; St. Aubin, J.A.; Sapinski, PArgonne National Lab., IL (United States). Environmental Assessment and Information Sciences Div. May 1992. 91p. Sponsored by Department of Defense, Washington, DC (United States). DOE Contract W-31109-ENG-38. Order Number DE93000396. Source: OSTI; NTIS (US Sales Only); GPO Dep.

This report summarizes information collected by Argonne National Laboratory (ANL) in support of the Special Operations Forces Planning and Rehearsal System (SOFPARS) Program. The focus is on the ground and maritime elements within the US Special Operations Command (USSOCOM), with particular emphasis on the joint aspects of special operations (SO) mission planning. The specific objective of this report is to document the following: Requirements for SOFPARS specified by SO personnel; Concept-of-operations information specified as part of the requirements-definition process, and Prototypes developed by ANL to assist SO personnel in defining and refining the requirements for SOFPARS. Requirements derived from or implied by the specified requirements are also discussed. In addition, background information is provided to aid in understanding the basis for requirements that call for the use of artificial intelligence and related technologies.

1461 (ORNL/TM–11973) **Graphics development of DCOR: Deterministic combat model of Oak Ridge.** Hunt, G. (Georgia Inst. of Tech., Atlanta, GA (United States)); Azmy, Y.Y. Oak Ridge National Lab., TN (United States). Oct 1992. 45p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE93001882. Source: OSTI; NTIS; GPO Dep.

DCOR is a user-friendly computer implementation of a deterministic combat model developed at ORNL. To make the interpretation of the results more intuitive, a conversion of the numerical solution to a graphic animation sequence of battle evolution is desirable. DCOR uses a coarse computational spatial mesh superimposed on the battlefield. This research is aimed at developing robust methods for computing the position of the combative units over the continuum (and also pixeled) battlefield, from DCOR's discrete-variable solution representing the density of each force type evaluated at gridpoints. Three main problems have been identified and solutions have been devised and implemented in a new visualization module of DCOR. First, there is the problem of distributing the total number of objects, each representing a combative unit of each force type, among the gridpoints at each time level of the animation. This problem is solved by distributing, for each force type, the total number of combative units, one by one, to the gridpoint with the largest calculated number of units. Second, there is the problem of distributing the number of units assigned to each computational gridpoint over the battlefield area attributed to that point. This problem is solved by distributing the units within that area by taking into account the influence of surrounding gridpoints using linear interpolation. Finally, time interpolated solutions must be generated to produce a sufficient number of frames to create a smooth animation sequence. Currently, enough frames may be generated either by direct computation via the PDE solver or by using linear programming techniques to linearly interpolate intermediate frames between calculated frames.

4501 Chemical Explosions and Explosives

Refer also to citation(s) 316, 1466

1462 (LA–12235-MS) **DSD technology: a detonation reactive Huygens code.** Bdzil, J.; Fickett, W. Los Alamos National Lab., NM (United States). Jul 1992. 49p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. Order Number DE93002714. Source: OSTI; NTIS (US Sales Only); GPO Dep.

The length of the reaction zone strongly influences the speed of propagation of detonation in multidimensional explosive pieces. Detonation Shock Dynamics (DSD) properly accounts for these effects in detonation wave-spreading problems when the radius of curvature of the multi-dimensional detonation shock is large compared to the explosive's reaction-zone length. This report is a user manual for our two-dimensional implementation of this method; a FORTRAN subroutine called DSD Technology.

1463 (SAND–91-2722C) **The development of an on-site container.** Glass, R.E. (Sandia National Labs., Albuquerque, NM (United States)); McAllaster, M.E.; Jones, P.L.; McKinney, A.L. Sandia National Labs., Albuquerque, NM (United States). [1991]. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. (CONF-920905–17: 10. international symposium on the packaging and transportation of radioactive materials: PATRAM '92, Yokohama (Japan), 13-18 Sep 1992). Order Number DE92040097. Source: OSTI; NTIS; GPO Dep.

Sandia National Laboratories (SNL) has developed a package for the on-site. transport of chemical munitions for the US Army. This package was designed to prevent the release of lethal quantities of chemical agents during transportation of munitions to the demilitarization facilities on-site. The packaging prevents auto-ignition of the munitions by limiting the thermal and structural assault on the munitions during an accident. This package, with some modifications to account for contents, may be suitable for the on-site transport of mixed wastes at United States Department of Energy

facilities. This paper discusses the design and verification testing of the package. The safety criteria for the package were modeled after the International Atomic Energy Agency (IAEA) hypothetical accident sequence and modified to take credit for operational controls. The modified accident sequence consisted of drop, puncture, and thermal events. The post-accident leak rate was established to prevent harm to an exposed worker. The packaging has a mass of 8600 kg and can accommodate up to 3600 kg of contents. The interior of the package is 188 cm in diameter and 232 cm long. Two sample ports can be used to sample the interior of the package prior to opening the closure and an o-ring test port can be used to determine the leak rates prior to and after transport.

Papers on containment and related geological, geophysical, engineering, chemical, and computational topics were included.

1466 (SAND–92-1011) **Technique for current step measurements on the low field Metal Oxide Varistor (MOV).** Jaramillo, R.A. Sandia National Labs., Albuquerque, NM (United States). Aug 1992. 13p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. Order Number DE93000843. Source: OSTI; NTIS; GPO Dep.

The low field (E≅2kV/cm) Metal Oxide Varistor (MOV) is a voltage regulation device. This report describes a technique for performing DC characteristic measurements on a MOV. The varistor is in the feedback loop of a high voltage operational amplifier. A current source forces a staircase current waveform through a MOV. An operational amplifier provides the required applied voltage to maintain the desired values of current through the varistor. The current values change at a maximum rate of 33.3 readings per second and a high speed voltmeter measures the varistor voltage. The maximum available current and voltage at present are 5 mA and 10 kV respectively. Examples of its use are with data from the MC3596 and XMC4317.

4504 Nuclear and Radiological Warfare

1467 (ORNL/TM–11917) **Analysis of the Spring-1990 two-meter box test bed experiments performed at the Army Pulse Radiation Facility (APRF).** Johnson, J.O.; Drischler, J.D.; Barnes, J.M. Oak Ridge National Lab., TN (United States). Aug 1992. 109p. Sponsored by Department of Defense, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE92041388. Source: OSTI; NTIS (US Sales Only); GPO Dep.

The capability to accurately assess and predict the effectiveness of radiation shielding materials in vehicles, structures, trenches, and other configurations is of considerable interest to the DoD and the DNA. A research effort involving several institutions has worked towards providing this capability for several years, resulting in the Monte Carlo Adjoint Shielding Code system - MASH. The purpose of this report is to present the results of a "benchmark" analysis of MASH against a set of measurements performed in the Spring of 1990 at the APRF and determine the capability of MASH in reproducing the measured neutron and gamma-ray dose data. In particular, the free-field environment was calculated along with measurements made using the "NATO standard test bed" (i.e. a two-meter box) and the RT-200 anthropormorphic phantom standing in the free-field and inside the two-meter box at the "NATO standard reference point" at 400 meters. The calculational results show mixed agreement with the measured data reported by the different teams of experimentalist. The neutron dose results indicate MASH consistently calculates more dose than was measured for both the phantom standing in the free-field and the phantom standing inside the two-meter box. The calculation/measurement differences were typically 20% to 30% for the phantom standing in the free-field and 10% to 20% for the phantom standing inside the two-meter box. The neutron reduction factors, however, typically agreed within ±20% for both phantom/box geometry configurations and orientations. With respect to the gamma-ray data, there were individual discrepancies between calculations and measurements however, typical agreement was within ±20%. The gamma-ray free-field environment at 400 meters continues to show a discrepancy between calculation and experiment which further manifest itself through the comparisons of the gamma-ray reduction factors.

1468 (ORNL/TM–11918) **Analysis of the spring 1991 two-meter box test bed experiments performed at the Army Pulse Radiation Facility (APRF).** Johnson, J.O.; Drischler, J.D.; Barnes, J.M. Oak Ridge National Lab., TN (United States). Sep 1992. 100p. Sponsored by Department of Defense, Washington, DC (United States). DOE Contract AC05-84OR21400. DNA MIPR-92-524. Order Number DE93000976. Source: OSTI; NTIS (US Sales Only); GPO Dep.

The capability to accurately assess and predict the effectiveness of radiation shielding materials in vehicles, structures, trenches, and other configurations is of considerable interest to the DoD and the DNA. A research effort involving several institutions has worked towards providing this capability for several years, resulting in the Monte Carlo Adjoint Shielding Code system - MASH. The purpose of this report is to present the results of a "benchmark" analysis of MASH against a third set of measurements performed in the Spring of 1991 at the APRF and determine the capability of MASH in reproducing the measured neutron and gamma-ray integral data. In particular, the free-field environment was calculated along with measurements made using the "NATO standard test bed" (i.e. a two-meter box) and the RT-200 anthropormorphic phantom standing in the free-field and inside the two-meter box lined with 5% borated polyethylene at the "NATO standard reference point" at 400 meters. The calculational results show mixed agreement with the measured data reported by the different teams of experimentalists. ne neutron dose results indicate good agreement (typically ±20%) for the phantom standing in the free-field and excellent agreement (typically ±10%) for the phantom standing inside the two-meter box. The neutron reduction factors however, agreed for the phantom standing in the free-field but exhibited significant differences for the phantom standing inside the box. With respect to the gamma-ray data, there were individual discrepancies between calculations and measurements; however, typical agreement was within ±20%. The C/E comparisons for the gamma-ray free-field environment at 400 meters showed improved agreement between calculation and experiment relative to the same comparisons in the Fall 1989 and Spring 1990 studies.

4505 Strategic Defense Initiative

1469 (ANL/CP–76975) **Parallelizing the track-target model for the MIMD machine.** Zhong Xiong, W.; Swietlik, C. Argonne National Lab., IL (United States). [1992]. 4p. Sponsored by Department of Defense, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-9210177–1: 1992 Institute of Electrical and Electronic Engineers (IEEE) system, man and cybernetics conference, Chicago, IL (United States), 18-21 Oct 1992). Order Number DE92041100. Source: OSTI; NTIS; GPO Dep.

Military Tracking-Target systems are important analysis tools for modelling the major functions of a strategic defense system operating against a ballistic missile threat during a simulated end-to-end scenario. As demands grow for modelling more trajectories with increasing numbers of missile types, so have demands for more processing power. Argonne National Laboratory has developed the parallel version of this Tracking-Target model. The parallel version has exhibited speedups of up to a factor of 6.3 resulting from a shared memory multiprocessor machine. This paper documents a project to implement the Tracking-Target model on a parallel processing environment.

1470 (SAND–92-1425C) **Results for the pyroshock ground test series for the STARS I and STARS II missile systems.** Cap, J.S. Sandia National Labs., Albuquerque, NM (United States). [1992]. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. (CONF-9210176–2: 63. shock and vibration symposium, Las Cruces, NM (United States), 27 Oct 1992). Order Number DE92040963. Source: OSTI; NTIS (US Sales Only); GPO Dep.

The STARS (Strategic Targeting System) I and II missile programs have completed ground test series in order to establish the component and payload responses for the shock environments created by the various pyrotechnic skin and stage separation events. Deficiencies in instrumentation and procedures hampered the STARS I test program. Steps were implemented in the later STARS II test program to correct these deficiencies. The purpose of this paper is to present the results for these test programs with an emphasis on those improvements that produced the higher quality data. Examples of the resulting shock environments will be presented, and these results will be compared with the guidelines from the proposed Mil Handbook.

Commission of the European Communities, Luxembourg (Luxembourg). 1992. 59p. (In Italian). Source: OSTI; NTIS (US Sales Only); INIS.

In this report there are briefly described the measurements of environmental radioactivity performed during 1990 by the site survey group of the Radioprotection Division at the Joint Research Centre Ispra Establishment. Data are give on the concentrations of Sr-90, Cs-137, HTO and other radionuclides in precipitation, air, waters, herbage, milk and radioactive effluents. The environmental contamination is mainly a consequence of the nuclear accident of Chernobyl.

1472 (ANL/CP–77170) **Evaluation of options for CO_2 capture/utilization/disposal.** Livengood, C.D.; Doctor, R.D. Argonne National Lab., IL (United States). [1992]. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-920951–2: US Department of Energy contractors review meeting on gasification and gas stream cleanup systems, Morgantown, WV (United States), 15-17 Sep 1992). Order Number DE93000611. Source: OSTI; NTIS; GPO Dep.

The primary objective of this project is to develop in-depth engineering evaluations of technologies for the capture, use, and disposal of carbon dioxide (CO_2).This project emphasizes CO_2 capture technologies combined with integrated gasification combined-cycle (IGCC) power systems. Complementary evaluations will address CO_2 transportation, CO_2 use, and options for the longterm sequestration of unused Co_2. Commercially available CO_2-capture technology will provide performance and economic baselines for comparing innovative technologies. These results will then support recommendations for research and development to improve $C0_2$ capture and use, new process concepts, and optimized energy balances for $C0_2$ mitigation. Limited experimental research will provide data for evaluating new concepts.

1473 (ANL/CP–77207) **Methodology and emission scenarios employed in the development of the National Energy Strategy.** Fisher, R.E. Argonne National Lab., IL (United States). [1992]. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. This paper describes the steps taken to model the National Energy Strategy (NES). It provides an overview of the NES process including the models used for the project. The National Energy Strategy Environmental Analysis Model (NESEAM), which was used in analyzing environmental impacts, is discussed. The structure of NESEAM, as well as results and analyses are presented.

1474 (BNL–45879-Rev.) **Tropospheric sampling with aircraft.** Daum, P.H.; Springston, S.R. Brookhaven National Lab., Upton, NY (United States). Mar 1991. 45p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016. (CONF-900402–13-Rev.: 199. national meeting of the American Chemical Society (ACS), Boston, MA (United States), 22-27 Apr 1990). Order Number DE92041317. Source: OSTI; NTIS; GPO Dep.

Aircraft constitute a unique environment which places stringent requirements on the instruments used to measure the concentrations of atmospheric trace gases and aerosols. Some of these requirements such as minimization of size, weight, and power consumption are general; others are specific to individual techniques. This review presents the basic principles and considerations governing the deployment of trace gas and aerosol instrumentation on an aircraft. An overview of common instruments illustrates these points and provides guidelines for designing and using instruments on aircraft-based measurement programs.

1475 (CONF-930133–1) **Cloud amount and sunshine duration in the People's Republic of China, 1954–1988.** Kaiser, D. Oak Ridge National Lab., TN (United States). [1992]. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From 73. American Meteorological Society (AMS) annual meeting; Anaheim, CA (United States); 17-22 Jan 1993. Order Number DE92041023. Source: OSTI; NTIS; INIS; GPO Dep.

A part of the world with extensive records of cloudiness is the People's Republic of China (PRC). These data, along with records of other meteorological observations, have recently been made available through a joint research agreement established between the US Department of Energy (DOE) and the PRC Chinese Academy of Sciences (CAS) for the purpose of studying possible global warming due to an enhanced greenhouse effect. This paper examines the variation of PRC cloudiness, along with that of sunshine duration (a useful measure of cloudiness), over the 35-year period 1954–1988.

1476 (DOE/ER/60245–2) **Research on the seasonal snow of the Arctic Slope: Annual progress report, January 16, 1986–January 15, 1987.** Benson, C.S. Alaska Univ., Fairbanks, AK (United States). Geophysical Inst. [1987]. 11p. Sponsored by

USDOE, Washington, DC (United States). DOE Contract FG06-84ER60245. Order Number DE93001431. Source: OSTI; NTIS; GPO Dep.

This project deals with the seasonal snow on Alaska's Arctic Slope. Although it is concentrated on snow of the R_4D project area, it is important to relate the snow cover of this area with the rest of the Arctic Slope. The goals include determination of the amount of precipitation which comes as snow, the wind transport of this snow and its depositional pattern as influenced by drifting, the physical properties of the snow, the physical processes which operate in it, the proportions of it which go into evaporation, infiltration and runoff, and the biological role of the snow cover.

1477 (DOE/ER/60245–3) **Research on the seasonal snow of the Arctic Slope: Annual progress report, January 16, 1987–January 15, 1988.** Benson, C.S. Alaska Univ., Fairbanks, AK (United States). Geophysical Inst. [1988]. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG06-84ER60245. Order Number DE93003039. Source: OSTI; NTIS; GPO Dep.

This project deals with the seasonal snow on Alaska's Arctic Slope. Although it is concentrated on snow of the R_4D project area, it is important to relate the snow cover of this area with the rest of the Arctic Slope. The goals include determination of the amount of precipitation which comes as snow, the wind transport of this snow and its depositional pattern as influenced by drifting, the physical properties of the snow, the physical processes which operate in it, the proportions of it which go into evaporation, infiltration and runoff, and the biological role of the snow cover. The 1984–1985, 1985–1986 and 1986–1987 seasonal snow was measured to determine its total quantity, its physical structure and its distribution as a function of wind and topography. Observations of meteorological parameters and snowpack characteristics during winter and spring have yielded information on the seasonal evolution of the snow in quantitative terms. A method of determining melt rates over large regions was developed and is being refined, progress was made on a model describing energy flux sources which control snow melting. A strong control is exerted by air mass advection on a broad scale. We are continuing to devote attention to the sources of energy and energy transfer mechanisms which control snow melt. The 1986 snow melt was two weeks later than the 1987 and 1985 meltouts. The delay was caused by advection of cold air from the Arctic Ocean. When it did get underway melting was very rapid and the snow pack disappeared in only half the time taken in 1985.

1478 (DOE/ER/60245–4) **Research on the seasonal snow of the Arctic Slope: Annual progress report, January 16, 1988–December 31, 1988.** Benson, C.S. Alaska Univ., Fairbanks, AK (United States). Geophysical Inst. [1988]. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG06-84ER60245. Order Number DE93003040. Source: OSTI; NTIS; GPO Dep.

The original objectives of this research included a regional study of snow on the entire Arctic Slope. During the first year the scope was restricted to the R_4D area. In the second and third years the primary focus was also on the R_4D area,but measurements were made at Prudhoe Bay, Atgasuk and Wainwright to determine the flux of wind-blown snow on a wider scale. Additional broadening of scope was discussed at the San Diego R_4D meetings in April 1986 and 1987 and at the extrapolation workshop held at Penn State University in Spring 1987. The broadening of scope has also included detailed studies of chemistry and controls exerted by large-scale advection of air masses on the longwave, thermal IR, and radiation. The latter phenomena are critical in initiating snowmelt.

1479 (DOE/ER/60245–5) **Research on the seasonal snow of the Arctic Slope: Annual progress report, January 1, 1989–December 31, 1989.** Benson, C.S. Alaska Univ., Fairbanks, AK (United States). Geophysical Inst. [1989]. 17p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG06-84ER60245. Order Number DE93003041. Source: OSTI; NTIS; GPO Dep.

This project deals with the seasonal snow on Alaska's Arctic Slope. Although it is concentrated on snow of the R40 project area, it is important to relate the snow cover of this area with the rest of the Arctic Slope. The goals include determination Of the amount of precipitation which comes as snow, the wind transport of this snow and its depositional pattern as influenced by drifting, the physical properties of the snow, the physical processes which operate in it, the proportions of it which go into evaporation, infiltration and runoff, and the biological role of the snow cover.

1481 (DOE/ER/60294–T2) **Participation of the Pennsylvania State University in the MAP3S precipitation chemistry network: Final report.** Lamb, D.; de Pena, R.G. Pennsylvania State Univ., University Park, PA (United States). Dept. of Meteorology. Apr 1991. 38p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-85ER60294. Order Number DE93001900. Source: OSTI; NTIS; INIS; GPO Dep.

The Meteorology Department of the Pennsylvania State University collected precipitation in central Pennsylvania for more than 14 years on behalf of the Multistate Atmospheric Power Production Pollution Study (MAP3S). The MAP3S protocol, based on the sampling of precipitation from individual meteorological events over a long period of time, has allowed both for the development of a chemical climatology of precipitation in the eastern region of the United States and for a vastly improved understanding of the atmospheric processes responsible for wet acidic deposition. The precipitation chemistry data from the Penn State MAP3S site provide evidence of links to the anthropogenic emissions of sulfur dioxide and oxidant precursors. There is now little doubt that the free acidity in the precipitation of the region is due to the presence of unneutralized sulfate in the aqueous phase. In the absence of significant sources of this sulfur species and in view of supplemental enrichment studies, it is concluded that the sulfate enters cloud and rain water primarily through the aqueous-phase oxidation of sulfur dioxide emitted into the air within the geographical region of deposition. Within the source region the local abundances of sulfur dioxide often exceed those of the oxidants, so the depositions of sulfate and free acidity tend to be modulated by the availability of the strong oxidants. As a consequence, the deposition of sulfate exhibits a very strong seasonal dependence and little response to changes in the emissions of sulfur dioxide.

1482 (DOE/ER/60294–T3) **Participation of the Pennsylvania State University in the MAP3S precipitation chemistry network: Final report.** Lamb, D.; de Pena, R.G. Pennsylvania State Univ., University Park, PA (United States). Dept. of Meteorology. Apr 1992. 38p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-85ER60294. Order Number DE93003108. Source: OSTI; NTIS; GPO Dep.

Precipitation in central Pennsylvania was collected for more than 14 years on behalf of the Multistate Atmospheric Power Production Pollution Study (MAP3S). The MAP3S protocol, based on the sampling of precipitation from individual meteorological events over a long period of time, has allowed both for the development of a chemical climatology of precipitation in the eastern region of the United States and for a vastly improved understanding of the atmospheric processes responsible for wet acidic deposition. The precipitation chemistry data from the Penn State MAP3S site provide evidence of links to the anthropogenic emissions of sulfur dioxide and oxidant precursors. There is now little doubt that the free acidity in the precipitation of the region is due to the presence of unneutralized sulfate in the aqueous phase. In the absence of

significant sources of this sulfur species and in view of supplemental enrichment studies, it is concluded that the sulfate enters cloud and rain water primarily through the aqueous-phase oxidation of sulfur dioxide emitted into the air within the geographical region of deposition. Within the source region the local abundances of sulfur dioxide often exceed those of the oxidants, so the depositions of sulfate and free acidity tend to be modulated by the availability of the strong oxidants. As a consequence, the deposition of sulfate exhibits a very strong seasonal dependence and little response to changes in the emissions of sulfur dioxide.

1483 (DOE/ER/60304–8) **Sensitivity of climate models: Comparison of simulated and observed patterns for past climates: Progress report, February 1, 1992–January 31, 1993.** Prell, W.L.; Webb, T. III. Brown Univ., Providence, RI (United States). Aug 1992. 16p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-85ER60304. Order Number DE93000893. Source: OSTI; NTIS; INIS; GPO Dep.

Predicting the potential climatic effects of increased concentrations of atmospheric carbon dioxide requires the continuing development of climate models. Confidence in the predictions will be much enhanced once the models are thoroughly tested in terms of their ability to simulate climates that differ significantly from today's climate. As one index of the magnitude of past climate change, the global mean temperature increase during the past 18,000 years is similar to that predicted for carbon dioxide–doubling. Simulating the climatic changes of the past 18,000 years, as well as the warmer-than-present climate of 6000 years ago and the climate of the last interglacial, around 126,000 years ago, provides an excellent opportunity to test the models that are being used in global climate change research. During the past several years, we have used paleoclimatic data to test the accuracy of the National Center for Atmospheric Research, Community Climate Model, Version 0, after changing its boundary conditions to those appropriate for past climates. We have assembled regional and near-global paleoclimatic data sets of pollen, lake level, and marine plankton data and calibrated many of the data in terms of climatic variables. We have also developed methods that permit direct quantitative comparisons between the data and model results. Our research has shown that comparing the model results with the data is an evolutionary process, because the models, the data, and the methods for comparison are continually being improved. During 1992, we have completed new modeling experiments, further analyzed previous model experiments, compiled new paleodata, made new comparisons between data and model results, and participated in workshops on paleoclimatic modeling.

1484 (DOE/ER/60422–7) **Natural and anthropogenic climate change: Final report, 1 March 1986–31 August 1992.** Portman, D.A.; Gutowski, W.J. Jr.; Wang, W.C.; Iacono, M.J.; Yang, S. Atmospheric and Environmental Research, Inc., Cambridge, MA (United States). 31 Aug 1992. 20p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-86ER60422. Order Number DE93000898. Source: OSTI; NTIS; INIS; GPO Dep.

This final report provides a broad overview of program accomplishments. Brief descriptions are provided for accomplishments with respect to intercomparisions and improvements in general circulation models, analysis of climatic data and climate model statistics, and accomplishments in the China Meteorology coordination.

1485 (DOE/ER/61057–2) **High spectral resolution measurements for the ARM Program: Year two technical progress report, March 15, 1991–March 15, 1992.** Revercomb, H.E. Wisconsin Univ., Madison, WI (United States). Space Science and Engineering Center. 22 May 1992. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-90ER61057. Order Number DE93002772. Source: OSTI; NTIS; GPO Dep.

This report focuses on the design and fabrication of high spectral resolution FTIR (Fourier Transform Infrared) instrumentation for the CART sites of the Atmospheric Radiation Measurement (ARM) Program. The ultimate objective of this grant is to develop three different types of instruments, named the AERI, AERI-X, and SORT. The Atmospheric Emitted Radiance Interferometer (AERI) is the simplest. It will be available for early deployment at the first ARM site and will be deployable at several locations in the extended network to give horizontal coverage. The AERI will be an 0.5 cm^{-1} resolution instrument, which measures accurately calibrated radiance spectra for radiation studies and for remote sensing of atmospheric state variables. The AERI-X and the SORTI are higher spectral resolution instruments for obtaining the highest practical resolution for spectroscopy at the ARM central sites. The AERI-X, like the AERI will measure atmospheric emitted radiance, but with resolutions as high as 0.1 cm^{-1}. The Solar Radiance Transmission Interferometer will measure the total transmission of the atmosphere by tracking the sun through changes in atmospheric air mass. The large solar signal makes it practical for this instrument to offer the ultimate in spectral resolution, about 0.002 cm^{-1}.

1486 (DOE/ER/61059–1) **Cloud and aerosol characterization for the ARM central facility: Multiple remote sensor techniques development: Technical progress report.** Sassen, K. Utah Univ., Salt Lake City, UT (United States). Dept. of Meteorology. 30 Apr 1992. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-90ER61059. Order Number DE93000915. Source: OSTI; NTIS; GPO Dep.

This research project designed to investigate how atmospheric remote sensing technology can best be applied to the characterization of the cloudy atmosphere. Our research program addresses basic atmospheric remote sensing questions, but at the same time is clearly directed toward providing information crucial to the ARM (Atmospheric Remote Sensing) program and for application to the Clouds and Radiation Testbed (CART). The instrumentation that is being brought into play includes a variety of art-of-the-art sensors. Available at NOAA WPL are polarization Doppler K_a-band (0.86 mm) and X-band (3.2 cm) radars, a $C0_2$(10.6 μm) Doppler lidar with sequential ' polarization measurement capabilities, a three-channel (20.6, 31.65 and 90 GHz) microwave radiometer, and variety of visible and infrared radiometers. Instrumentation at the University of Utah Facility for Atmospheric Remote Sensing (FARS) includes a polarization ruby (0.643 μm) lidar, a narrow-beam (0.14°) mid-infrared (9.5–11.5 μm) radiometer coaligned with the lidar, several other radiometers in the visible and infrared spectral regions, and an advanced two-color (1.06 and 0.532 μm), four-channel Polarization Diversity Lidar (PDL) and all-sky video imaging system that have only recently been developed under the ARM IDP.

1487 (DOE/ER/61065–2) **Testbed model and data assimilation for ARM: Progress report No. 2, 1 March 1991–31 August 1992 (revised).** Louis, J.F. Atmospheric and Environmental Research, Inc., Cambridge, MA (United States). 22 Sep 1992. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-90ER61065. Order Number DE93001792. Source: OSTI; NTIS; INIS; GPO Dep.

The objectives of this contract are to further develop and test the ALFA (AER Local Forecast and Assimilation) model originally designed at AER for local weather prediction and apply it to three distinct but related purposes in connection with the Atmospheric Radiation Measurement (ARM) program: (a) to provide a testbed that simulates a global climate model in order to facilitate the development and testing of new cloud parametrizations and radiation models; (b) to assimilate the ARM data continuously at the scale of a climate model, using the adjoint method, thus providing the initial conditions and verification data for testing parameumtions; (c) to study the sensitivity of a radiation scheme to cloud parameters, again using the adjoint method, thus demonstrating the usefulness of the testbed model. The data assimilation will use a variational technique that minimizes the difference between the model results and the observation during the analysis period. The adjoint model is used to compute the gradient of a measure of the model errors with respect to nudging terms that are added to the equations to force the model output closer to the data. The radiation scheme that will be included in the basic ALFA model makes use of a gen two-stream approximation, and is designed for vertically inhonogeneous, multiple-scattering atmospheres. The sensitivity of this model to the definition of cloud parameters will be studied. The adjoint technique will also be used to compute the sensitivities. This project is designed to provide the Science Team members with the appropriate tools and modeling environment for proper testing and

tuning of new radiation models and cloud parametrization schemes.

1488 (DOE/ER/61361–1) **Parameterization of GCM Subgrid nonprecipitating cumulus and stratocumulus clouds using stochastic/phenomenological methods: Annual technical progress report, 1 December 1991–30 November 1992.** Stull, R.B. Wisconsin Univ., Madison, WI (United States). Dept. of Atmospheric and Oceanic Sciences. 26 Aug 1992. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-92ER61361. Order Number DE93000424. Source: OSTI; NTIS; GPO Dep.

A theory was developed for the fraction of near-surface air likely to form forced and active cumulus clouds. This stochastic method is based on a 2-D frequency distribution of the occurrence of various buoyancy and condensation levels in air near the surface, and the relationship of this distribution to the mean temperature profile. An alternative form of this theory utilizes a 2-D distribution of convective available potential energies (CAPE) instead of virtual potential temperatures.

1489 (DOE/NV/10630–33-Vol.1) **US Department of Energy Nevada Field Office annual site environmental report, 1991: Volume 1.** Black, S.C.; Latham, A.R.; Townsend, Y.E. (eds.). Reynolds Electrical and Engineering Co., Inc., Las Vegas, NV (United States). Sep 1992. 339p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC08-89NV10630. Order Number DE93002977. Source: OSTI; NTIS; INIS; GPO Dep.

Monitoring and surveillance on and around the Nevada Test Site (NTS) by DOE contractors and Site user organizations during 1991 indicated that underground nuclear testing operations were conducted in compliance with regulations, i.e., the dose the maximally exposed offsite individual could have received was less than 0.09 percent of the guideline for air exposure. All discharges of radioactive liquids remained onsite in containment ponds, and there was no indication of potential migration of radioactivity to the offsite area through groundwater. Surveillance around the NTS Indicated that airborne radioactivity from test operations was not detectable off site, and no measurable net exposure to members of the offsite population was detected through the offsite dosimetry program. The calculated maximum effective dose equivalent off site would have been 8.6×10^{-3} mrem. Any person receiving this dose was also exposed to 142 mrem from natural background radiation. There were no nonradiological releases to the offsite area. Hazardous wastes were shipped to EPA approved disposal facilities. Compliance with the various regulations stemming from the National Environmental Policy Act Is being achieved and, where mandated, permits for air and water discharges and waste management have been obtained from the appropriate agencies. Non-NTS support facilities complied with the requirements of air quality permits and state or local wastewater discharge and hazardous waste permits.

1490 (DOE/NV/10630–33-Vol.2) **US Department of Energy Nevada Field Office annual site environmental report, 1991: Volume 2, Appendices.** Black, S.C.; Latham, A.R.; Townsend, Y.E. (eds.). Reynolds Electrical and Engineering Co., Inc., Las Vegas, NV (United States). Sep 1992. 329p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC08-89NV10630. Order Number DE93002978. Source: OSTI; NTIS; INIS; GPO Dep.

These appendices contain 1991 Nevada Test Site (NTS) onsite and offsite milk environmental monitoring results. The onsite data presented are accompanied by summaries of statistical evaluation of the data. Other offsite data collected by the EPA are available from the US Environmental Protection Agency, Environmental Monitoring Systems Laboratory, Las Vegas, Nevada.

1491 (DOE/PE–0105P) **Climate change and related activities.** USDOE, Washington, DC (United States). [1992]. 17p. Sponsored by USDOE, Washington, DC (United States). Order Number DE93000477. Source: OSTI; NTIS; INIS; GPO Dep.

The production and consumption of energy contributes to the concentration of greenhouse gases in the atmosphere and is the focus of other environmental concerns as well. Yet the use of energy contributes to worldwide economic growth and development. If we are to achieve environmentally sound economic growth, we must develop and deploy energy technologies that contribute to global stewardship. The Department of Energy carries out an aggressive scientific research program to address some of the key uncertainties associated with the climate change issue. Of course, research simply to study the science of global climate change is not enough. At the heart of any regime of cost-effective actions to address the possibility of global climate change will be a panoply of new technologies-technologies both to provide the services we demand and to use energy more efficiently than in the past. These, too, are important areas of responsibility for the Department. This report is a brief description of the Department's activities in scientific research, technology development, policy studies, and international cooperation that are directly related to or have some bearing on the issue of global climate change.

1492 (EGG–10617-1151) **Development and validation of atmospheric dispersion models for ideal gases and hydrogen fluoride: Part 1, Technical reference manual.** McFarlane, K. (Shell Research Ltd., Chester (United Kingdom). Thornton Research Centre); Prothero, A.; Puttock, J.S.; Roberts, P.T.; Witlox, H.W.M. EG and G Energy Measurements, Inc., Las Vegas, NV (United States); Shell Research Ltd., Chester (United Kingdom). Thornton Research Centre. Nov 1990. 690p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC08-88NV10617. Order Number DE93000953. Source: OSTI; NTIS (documentation only); ESTSC (complete software package), P.O. Box 1020, Oak Ridge, TN 37831-1020; GPO Dep.

The thermodynamic behavior of hydrogen fluoride when diluted with air, particularly moist air, is very different from that of a simple ideal gas. The gas-air mixture can, depending on conditions, be denser than ambient air or substantially less dense than air. This behavior of an HF cloud would have a major influence on the dispersion behavior of HF in the atmosphere if it were released accidentally. For gases such as LNG thermodynamic effects must be included in dispersion models in order to accurately simulate such releases. Because of the unique thermodynamic properties of HF, it was felt that those properties would be important in accurately simulating an HF release. This program identified three major areas in which substantial uncertainties existed in previous models: (1) the modeling of the complex thermodynamics of HF/H_2O/Air mixtures (including aerosol effects on cloud density); (2) the treatment of a wide range of surface roughness conditions (including possible multiple surface roughness conditions) and (3) jet flow and air entrainment for pressurized releases of HF, followed by transition to ground-based dense gas dispersion. Major objectives of this study were to develop and validate computer-based models to calculate the release properties in addition to simulating jet and plume behavior downwind of an accidental release of HF.

1493 (ETDE-IT–92-86) **Pollution transport event in Italian Alps: Monitoring, measurement and analysis.** Marcazzan, G.M.; Maugeri, M.; Bonelli, P. Milan Univ. (Italy). Ist. di Fisica Generale Applicata; Ente Nazionale per l'Energia Elettrica, Milan (Italy). Centro Termica e Nucleare. 1990. 16p. (In Italian). Order Number DE93729446. Source: OSTI; NTIS (US Sales Only); INIS.

The study of long range transport of aerosol pollution is a field of increasing interest. Within the framework of a program of aerosol characterization in urban areas and remote sites, a pollution transport event was identified through concentration analysis of some tracer elements in particulate matter. PIXE and PIGE code analyses of the concentrations of some elements of atmospheric particulate collected in Milan showed unusually high concentrations of S, Zn, V, Ni, and K in the period 30/6/87-2/7/87. After some days (3/7/87-5/7/87), very high concentrations of the same elements were measured also in the samples collected in a mountain station (Sestriere) situated 200 km west of Milan. The analysis of the anemological situation showed a systematic tendency of the flow to move slowly speed eastward in the whole Po Valley, suggesting the hypothesis of an event of long range pollution transport. The analysis of the daily maximum mixing depth and the calculation of back and forward trajectories supported this hypothesis.

1494 (ETDE-IT–92-88) **Air mass identification in relation to pollution episodes in Italian Alps.** Anfossi, D.; Novo, A.; Rossi, G.C.; Villone, B. Consiglio Nazionale delle Ricerche, Turin (Italy). Lab. di Cosmo-Geofisica; Ente Nazionale per l'Energia Elettrica, Milan (Italy). Centro Termica e Nucleare; Ente Nazionale per

l'Energia Elettrica, Milan (Italy). Centro di Ricerca Idraulica e Strutturale. 1991. 8p. Order Number DE93729448. Source: OSTI; NTIS (US Sales Only).

During 1990, the Eurotrac research group analyzed chemical and meteorological data of the Stubai intercomparison sampling exercise (performed the previous year); sampled twice the snow at Sestriere and Glacier Careser; and performed the chemical analysis of the collected samples. The aim of the research was to trying to interpret, from a meteorological stand-point, the concentration of compounds of particular interest found in the above snow samples. This was performed by means of an air mass trajectory model based on the ECMWF analysis.

1495 (EUR–13369) **A survey of nitrogen dioxide in Paris. July 1989 - January 1990.** Atkins, D.H.F.; Quirino, I. Commission of the European Communities, Luxembourg (Luxembourg). 1992. 59p. Source: OSTI; NTIS (US Sales Only).

A survey of NO_2 has been carried out in the Paris area using simple passive diffusion tube samplers. These samplers were exposed at sites across the city in areas designated as background, where the NO_2 concentration is locally representative (i.e. > 50 m from significant sources of NO_2 such as busy roads). The density of sites was highest in the city centre of Paris, decreasing to the outer suburbs. Sampling was carried out for seven consecutive four-week sampling periods starting in July 1989. Data were mapped by computer in three intervals: the summer season (July-September inclusive), the winter (October-January) and the whole survey which, spanning the interval from midwinter to midsummer could, with some reservations, be equated with the annual average. Nitrogen dioxide concentrations were greater in the winter but nevertheless all maps showed broadly similar features with highest concentrations in central Paris.

1496 (IGC–125) **Atmospheric studies with SODAR at Kalpakkam.** Somayaji, K.M. Indira Gandhi Centre for Atomic Research, Kalpakkam (India). 1991. 70p. Order Number DE93605544. Source: OSTI; NTIS (US Sales Only); INIS.

A doppler SODAR for measurement of wind characteristics at different heights has been installed at HASL, IGCAR, Kalpakkam and is in operation since January 1990. The technical specifications and the basic aspects of SODAR, siting considerations and installation details are given. The report also discusses some observations regarding the site selection, installation and operation of SODARs. The basic theory of SODARs, some aspects of turbulence and dispersion in atmosphere and the various stability classification schemes are outlined. Some details regarding land/sea-breeze circulations and inversions are also given. (author). 6 refs., 10 figs., 8 annextures.

1497 (KTM/E-B–114) **Economic effects of carbon dioxide emission abatement: Economic effects in Finland.** Maeenpaeae, I.; Tervo, H. Ministry of Trade and Industry, Helsinki (Finland). 1992. 75p. (In Finnish). Project KTM-22/881/91. Order Number DE93721610. Source: OSTI; NTIS.

Analysis is based on the results of FMS model system, the Finnish long term Model System. FMS is multisectoral equilibrium growth model. During the research project a comprehensive energy consumption and production sub-model was constructed, where the options and costs of energy saving and the structures of electricity and heat production are depicted. The fuel use of energy consumption and production is joined with air emissions and economic policy measure links. As measures of reduction of CO2 emissions carton tax, subsidies to energy saving investments and basic plant alternatives in electricity production are analyzed. The domestic carton tax deteriorates foreign competitiveness if the other cost factors of the economy do not adapt. In the analysis where either the wage rate or the terms of trade adjust in such a way that the average price level of the economy in terms of the foreign price level does not change, even a considerable carbon tax does not deteriorate exports and lead to the fall of the level of the economic activity. The international carbon tax causes price rise of commodities in the same way as in Finland. Then the competitiveness of Finland does not deteriorate. The terms of trade of Finland improves instead which has favourable effects to the economic growth. Three alternatives in electricity production are compared, normalized 1000 MW coal, nuclear and natural gas stations. In the conditions of the reference scenario the nuclear power stations diminishes CO2 emissions about 8 % and the natural gas station 4 %. The nuclear power station yields a little bit greater level of the economic activity than the coal station and natural gas a bit lower level.

1498 (LBL–31916) **Volatile organic chemical emissions from carpets: Final report.** Hodgson, A.T.; Wooley, J.D.; Daisey, J.M. Lawrence Berkeley Lab., CA (United States). Apr 1992. 122p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00098. Order Number DE93001581. Source: OSTI; NTIS; GPO Dep.

The primary objective of this research, was to measure the emission rates of selected individual VOC, including low molecular-weight aldehydes, released by samples of four new carpets that are typical of the major types of carpets used in residences, schools and offices. The carpet samples were collected directly from the manufacturers' mills and packaged to preserve their chemical integrity. The measurements of the concentrations and emission rates of these compounds were made under simulated indoor conditions in a 20-M^3 environmental chamber designed specifically for investigations of VOC. The measurements were conducted over a period of one week following the installation of the carpet samples in the chamber. Duplicate experiments were conducted for one carpet. In addition, the concentrations and emission rates of VOC resulting from the installation of a new carpet in a residence were measured over a period of seven weeks. The stabilities of the week-long ventilation rates and temperatures were one percent relative standard deviation. The four carpets emitted a variety of VOC, 40 of which were positively identified. Eight of these were considered to be dominant. They were (in order of chromatographic retention time) formaldehyde, vinyl acetate, 2,2,4-trimethylpentane (isooctane), 1,2-propanediol (propylene glycol), styrene, 2-ethyl-l-hexanol, 4-phenylcyclohexene (4-PCH), and 2,6 di-tert-butyl-4-methylphenol (BHT). With the exception of formaldehyde, only limited data are available on the toxicity and irritancy of these compounds at low concentrations. Therefore, it is difficult to determine at this time the potential magnitude of the health and comfort effects that may occur among the population from exposures to emissions from new carpets. The concentrations and emission rates of most compounds decreased rapidly over the first 12 h of the experiments.

1499 (NEI-DK–954) **Interference from acid gases in relation to the measurement of dust concentrations.** Holm Christensen, B. (dk-TEKNIK (DK)). Danske Elvaerkers Forening, Copenhagen (Denmark). Kraftvaerkernes Miljoeudvalg, Stofemissionsgruppen. 1990 53p. (In Danish). Order Number DE93721380. Source: OSTI; NTIS.

Acid gases can interfere with measurement of dust by binding to particles that are collected in the filter used for taking samples or to the actual filter material. If the acid gases have bound themselves to the particles before these are taken out of the chimney, this is called interference. Measurements were taken on blok 3 of Amagervaerket, a power station located on the outskirts of Copenhagen, Denmark, in order to ascertain the extent of interference with regard to measurement of dust from modern coal-fired power plants and to test various methods of measurement. It was found that the concentration of sulphates on the collected particles generally lay under a concentration in the flue gas answering to 1 mg per cubic meter (n,t) flue gas at 12% carbon dioxide. It could be possible that the amount of sulphates results from interference from SO_2 and SO_3. HCl was not found bound to particles to an extent that made detection possible. Interference in connection with measurings taken on electrofilters and scrubbers are evaluated to be 0-11% of the particle concentration. Average particle concentration was 8.5 mg per cubic meter (n,t) which means an interference of 0-0.85 mg per cubic meter (n,t). In the there were chimney lower particle concentrations, but a higher percentage of sulphate on the particles. The traditional gravimetric particle measuring method is recommended combined with extraction of filter and filter cake APA method 5F with following sulphate analysis of the extract. This method can only show how large the maximum interference is. (AB).

1500 (ORNL/CDIAC–48) **Carbon Dioxide Information Analysis Center: FY 1991 activities.** Cushman, R.M.; Stoss, F.W.

Oak Ridge National Lab., TN (United States). Carbon Dioxide Information Analysis Center. Jun 1992. 81p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE92041010. Source: OSTI; NTIS; GPO Dep.

Environmental Sciences Division Publication No. 3788.

During the course of a fiscal year, Oak Ridge National Laboratory's Carbon Dioxide Information Analysis Center (CDIAC) distributes thousands of specially publications-numeric data packages (NDPs), computer model packages (CMPs), technical reports, public communication publications, newsletters, article reprints, and reference books-in response to requests for information related to global environmental issues, primarily those pertaining to climate change. CDIAC's staff also provides technical responses to specific inquiries related to carbon dioxide (CO_2), other trace gases, and climate. Hundreds of referrals to other researchers, policy analysts, information specialists, or organizations are also facilitated by CDIAC's staff. This report provides an account of the activities accomplished by CDIAC during the period October 1, 1990 to September 30, 1991. An organizational overview of CDIAC and its staff is supplemented by a detailed description of inquiries received and CDIAC's response to those inquiries. An analysis and description of the preparation and distribution of numeric data packages, computer model packages, technical reports, newsletters, factsheets, specially publications, and reprints is provided. Comments and descriptions of CDIAC's information management systems, professional networking, and special bilateral agreements are also described.

1501 (ORNL/CDIAC–53) **The Global Historical Climatology Network: Long-term monthly temperature, precipitation, sea level pressure, and station pressure data.** Vose, R.S. (Tennessee Univ., Knoxville, TN (United States). Energy, Environment and Resources Center); Schmoyer, R.L.; Steurer, P.M.; Peterson, T.C.; Heim, R.; Karl, T.R.; Eischeid, J.K. Oak Ridge National Lab., TN (United States). Carbon Dioxide Information Analysis Center. Jul 1992. 317p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. (NDP–041). Order Number DE92040521. Source: OSTI; NTIS; GPO Dep.

Environmental Sciences Division Publication No. 3912.

Interest in global climate change has risen dramatically during the last several years. In a similar fashion, the number of data sets available to study global change has also increased. Unfortunately, these data sets have been compiled by many different organizations/researchers, making it confusing and time consuming for individual researchers to acquire the "best" data. In response to this rapid growth in the number of global data sets, the Carbon Dioxide Information Analysis Center (CDIAC) and the National Climatic Data Center (NCDC) commenced the Global Historical Climatology Network (GHCN) project. The purpose of this project is to compile an improved global base-line data set of long-term monthly mean temperature, precipitation, sea level pressure, and station pressure for a dense network. of worldwide meteorological stations. Specifically, the GHCN project seeks to consolidate the numerous preexisting national-, regional-, and global-scale data sets into a single global climate data base that can be updated, enhanced, and distributed at regular intervals. The first version of the GHCN data base was completed during the summer of 1992. It contains 6039 temperature, 7533 precipitation, 1883 sea level pressure, and 1873 station pressure stations. All stations have at least 10 years of data, 40% have more than 50 years of data, and 10% have more than 100 years of data. Spatial coverage is good over most of the globe, particularly for the United States and central Europe. In comparison to other major global data sets, dramatic improvements are evident over South America, Africa, and Asia. The GHCN data base is available as a Numeric Data Package (NDP) from CDIAC. The NDP consists of this document and two magnetic tapes that contain machine-readable data files and accompanying retrieval codes. This document describes, in detail, both the GHCN data base and the contents of the magnetic tap

1502 (PNL-SA–20951) **Modeling the uncertain impacts of climate change.** Liebetrau, A.M. Pacific Northwest Lab., Richland, WA (United States). Aug 1992. 3p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (CONF-9208149–1: 3. International Environmetrics Society (IES) conference, Espoo (Finland), 17-21 Aug 1992). Order Number DE92041339. Source: OSTI; NTIS; INIS; GPO Dep.

Human and earth systems are extremely complex processes. The modeling of these systems to assess the effects of climate change is an activity fraught with uncertainty. System models typically involve the linking of a series of computer codes, each of which is a detailed model of some physical or social process in its own right. In such system models, the output from one process model is the input to another. Traditional methods for dealing with uncertainty are inadequate because of the sheer complexity of the modeling effort: Monte Carlo methods and the exhaustive evaluation of "what if?" scenarios estimate sensitivities fail because of the heavy computational burden. More efficient methods are required for learning about system models that are constructed from a collection of computer codes. A two-tiered modeling approach is being developed to estimate the distribution of outcomes from a series of nested models. The basic strategy is to develop a simplified executive, or simplified system code (SSC), that is analogous to the more complex underlying code. An essential feature of the SSC is that it uses information abstracted from the detailed underlying process codes in a manner that preserves their essential features and interactions among them. Of course, to be useful, the SSC must be much faster to run than its complex counterpart. The success of the SSC modeling strategy depends on the methods used to extract essential features of the complex underlying codes.

1503 (SAND–92-2069) **Description and validation of ERAD: An atmospheric dispersion model for high explosive detonations.** Boughton, B.A.; DeLaurentis, J.M. Sandia National Labs., Albuquerque, NM (United States). Oct 1992. 80p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. Order Number DE93002515. Source: OSTI; NTIS; GPO Dep.

The Explosive Release Atmospheric Dispersion (ERAD) model is a three-dimensional numerical simulation of turbulent atmospheric transport and diffusion. An integral plume rise technique is used to provide a description of the physical and thermodynamic properties of the cloud of warm gases formed when the explosive detonates. Particle dispersion is treated as a stochastic process which is simulated using a discrete time Lagrangian Monte Carlo method. The stochastic process approach permits a more fundamental treatment of buoyancy effects, calm winds and spatial variations in meteorological conditions. Computational requirements of the three-dimensional simulation are substantially reduced by using a conceptualization in which each Monte Carlo particle represents a small puff that spreads according to a Gaussian law in the horizontal directions. ERAD was evaluated against dosage and deposition measurements obtained during Operation Roller Coaster. The predicted contour areas average within about 50% of the observations. The validation results confirm the model's representation of the physical processes.

1504 (SA-PUB–9/89-Vol.1) **Conference on climate and water: Volume 1.** Huttunen, L. (ed.). Academy of Finland, Helsinki (Finland). 1989. 520p. (CONF-8909491–Vol.1: Conference on climate and water, Helsinki (Finland), 11-15 Sep 1989). Order Number DE93721620. Source: OSTI; NTIS; INIS.

This book contains the Proceedings of the Conference on Climate and Water under the following groupings: Understanding the climate systems - its variability and potential for change; Climate and hydrological cycle - the effects of climate variability and Change.

1505 (SA-PUB–9/89-Vol.1, pp. 9-30) **Climatic conditions of the future.** Budyko, M.I. (State Hydrological Institute, Leningrad (USSR). Research Dept.). Academy of Finland, Helsinki (Finland). 1989. (CONF-8909491–Vol.1: Conference on climate and water, Helsinki (Finland), 11-15 Sep 1989). In *Conference on climate and water: Volume 1.* 520p. Order Number DE93721620. Source: OSTI; NTIS.

All the existing methods of evaluating future climates being approximate (with errors of these evaluations difficult to determine), the evident way to choose to solve the above mentioned problem is to use the approach traditionally applied in many fields of science which is based on comparing the results of two or more independent methods of calculations. Good agreement of these results can

serve as a proof of their being valid. One of the variants of such an approach while predicting future climatic conditions is to compare the results of theoretical calculations by climate simulations with the results obtained by empirical methods, climate analogue method having acquired by now the principal meaning. The latter method is based on using the materials on paleoclimatic warm intervals as demonstrating the possible patterns of meteorological elements regime in the future with the similar level of global warming.

1506 (SA-PUB–9/89-Vol.1, pp. 73-92) **Simulation of the impact of CO_2 atmospheric doubling on precipitation and evapotranspiration - study of the sensitivity to various hypotheses.** Bultot, F. (Royal Meteorological Institute of Belgium (Belgium). Hydrology Section); Gellens, D. Academy of Finland, Helsinki (Finland). 1989. (CONF-8909491–Vol.1: Conference on climate and water, Helsinki (Finland), 11-15 Sep 1989). In *Conference on climate and water: Volume 1.* 520p. Order Number DE93721620. Source: OSTI; NTIS.

In the $2xCO_2$ scenarios, based on the results yielded by General Circulation Models, and currently used to simulate the hydrological impact, two hypotheses are generally made. One of these is that the number of precipitation days remains unchanged. The increased precipitation amounts in the winter season imply increased precipitation intensities, and oppositely, the decreased amounts in the summer season, decreased intensities. The second hypothesis deals with the relative humidity. This element is kept equal to its present value. Hence, the increased temperature implies increased values of both the water vapour pressure and the saturation deficit. This leads to greater values of the potential evapotranspiration and consequently of the effective evapotranspiration. The present study focuses on the sensitivity of the results, got for Belgium, to specific modifications made in the above-mentioned hypotheses. On the one hand, the frequency of precipitation days is no longer kept constant but set to vary in terms of the monthly precipitation amount. On the other hand, the water vapour pressure is estimated by assuming that the relative humidity reaches 95 %, 100 %, 105 % and 110 % of its present value. These sensitivity studies are reported for two typical basins in Belgium.

1507 (SA-PUB–9/89-Vol.1, pp. 93-102) **Long-term variability of precipitation in Austria.** Behr, O. (Universitaet Wien, (Austria). Institut fuer Hydraulik, Gewaesserkunde und Wasserwirtschaft). Academy of Finland, Helsinki (Finland). 1989. (CONF-8909491–Vol.1: Conference on climate and water, Helsinki (Finland), 11-15 Sep 1989). In *Conference on climate and water: Volume 1.* 520p. Order Number DE93721620. Source: OSTI; NTIS.

Long-term characteristics of precipitation are a major input variable to many problems in water management. Fluctuations of long time series together with regional variability, therefore, have been investigated in Austria using monthly precipitation data. The results indicate spatial patterns of long-term variability dominated by the Alps. It was shown that annual or even seasonal values may be insufficient for assessing trends. Thus monthly data should be preferred. Observation data also indicates that the conventional conception of a stable long-term mean does not apply to precipitation and thus a careful consideration of variability of precipitation is indispensable. The problems of assessing the long-term spatial patterns of precipitation fluctuations in an area as small as Austria led to a joint project of all Danube countries within the framework of the International Hydrological Program of UNESCO in 1988.

1508 (SA-PUB–9/89-Vol.1, pp. 31-50) **Projected climatic changes and impacts in Europe due to increased Co_2.** Bach, W. (University of Muenster (Germany, F.R.). Center for Applied Climatology and Environmental Studies). Academy of Finland, Helsinki (Finland). 1989. (CONF-8909491–Vol.1: Conference on climate and water, Helsinki (Finland), 11-15 Sep 1989). In *Conference on climate and water: Volume 1.* 520p. Order Number DE93721620. Source: OSTI; NTIS.

An overview of the observed climate changes in the recent past is given in this paper. This is followed by highlighting the projected climatic changes using scenario analysis based on general circulations models. The climatic change and impact analyses concentrate on the European scene. The paper ends by listing the priorities of the required political action.

1509 (SA-PUB–9/89-Vol.1, pp. 103-110) **Long-term variations of the water balance in Sweden: A preliminary study.** Jutman, T. (Swedish Meteorological and Hydrological Inst., Norrkoeping (Sweden)); Bergstroem, S.; Eriksson, B. Academy of Finland, Helsinki (Finland). 1989. (CONF-8909491–Vol.1: Conference on climate and water, Helsinki (Finland), 11-15 Sep 1989). In *Conference on climate and water: Volume 1.* 520p. Order Number DE93721620. Source: OSTI; NTIS.

950preliminary statistical analysis of records of precipitation, runoff and forest biomass is made to detect trends and interactions. Because of the risk of inconsistencies in the data the analysis is mainly restricted to the period 1945 - 1987. The results indicate a possible increase of evapotranspiration due to increasing forest biomass. Further studies are, however, needed before any definite conclusions can be drawn.

1510 (SA-PUB–9/89-Vol.1, pp. 111-120) **Changes of precipitation in Finland.** Heino, R. (Finnish Meteorological Inst., Helsinki (Finland)). Academy of Finland, Helsinki (Finland). 1989. (CONF-8909491–Vol.1: Conference on climate and water, Helsinki (Finland), 11-15 Sep 1989). In *Conference on climate and water: Volume 1.* 520p. Order Number DE93721620. Source: OSTI; NTIS.

A review on long-term changes of precipitation in Finland is presented. The homogeneity of the precipitation records is also discussed. Changes of precipitation gauges as well as relocations of stations and other environmental changes explain much of the long-term changes of precipitation. Taking into account the main sources of inhomogeneity some general features of precipitation changes can be shown. They include: a long-term decrease in southern Finland and a recent increase in the middle parts of the country, while in the north the changes have been small.

1511 (SA-PUB–9/89-Vol.1, pp. 149-157) **Atmospheric transport of heat and water: A review.** Holopainen, E.O. (Helsinki Univ. (Finland). Dept. of Meteorology). Academy of Finland, Helsinki (Finland). 1989. (CONF-8909491–Vol.1: Conference on climate and water, Helsinki (Finland), 11-15 Sep 1989). In *Conference on climate and water: Volume 1.* 520p. Order Number DE93721620. Source: OSTI; NTIS.

The paper reviews recent studies of atmospheric cycles of water and energy based on the use of atmospheric circulation data. Applications of the 'aerological method' of determining the difference between surface evaporation and precipitation, as well as those of the 'residual method' of inferring the distribution of diabatic heating in the atmosphere are considered. It appears that recent developments in meteorological data assimilation methods have considerably improved the usefulness of these methods. The validation of the estimates of total atmospheric energy source against satellite measurements of net radiation is also discussed.

1512 (SA-PUB–9/89-Vol.1, pp. 177-186) **The characterization of hydrometeorological elements.** Winter, J. (Technical University Budapest (Hungary). Dept. of Water Supply Management). Academy of Finland, Helsinki (Finland). 1989. (CONF-8909491–Vol.1: Conference on climate and water, Helsinki (Finland), 11-15 Sep 1989). In *Conference on climate and water: Volume 1.* 520p. Order Number DE93721620. Source: OSTI; NTIS.

In Hungary studies and written data do not support the warming trend and lack of precipitation found in the climate of the world in general. As a significant trend cannot been found within the climate of Northern-Hungary, the closer study of hydrometeorological element statistics are well-founded. The characterization was made using the monthly mean value, that is to say, the amount of temperature, sunshine duration, air humidity, the amount of wind and precipitation.

1513 (SA-PUB–9/89-Vol.1, pp. 197-208) **The long term evolution of the Italian climate outlined by using the standardized anomaly index (SAI).** Giuffrida, A. (Servizio Meteorologico dell Aeronautica, Roma (Italy)); Conte, M. Academy of Finland, Helsinki (Finland). 1989. (CONF-8909491–Vol.1: Conference on climate and water, Helsinki (Finland), 11-15 Sep 1989). In *Conference on climate and water: Volume 1.* 520p. Order Number DE93721620. Source: OSTI; NTIS.

Climatic change studies are very interesting, but present difficulties connected to the need of long lasting and homogenous data sets. In the study the SAI is applied to groups of Italian stations for which data of temperature are available since 1866 and data of rainfall since 1813. The application is made to annual values. In the field of temperature, a clear and significative trend is shown. The SAI values pass from -0,30 to +0,19, that is, extending the Sharon Nicholson's subdivision, from below the normal to positive normal values. In the field of precipitation, a smoothing of the SAI of the whole set of data shows a 'parabolic' shape indicating an increase of rainfall in the first half of the set and a decrease starting, approximately, since 1900. The decrease is in particular marked in these last 30 years.

1514 (SA-PUB–9/89-Vol.1, pp. 209-218) **Changing synoptic weather patterns, rainfall regimes and acid inputs in the East Midlands, U.K.** Wilby, R. (Loughborough Univ. of Technology (GB). Geography Dept.). Academy of Finland, Helsinki (Finland). 1989. (CONF-8909491–Vol.1: Conference on climate and water, Helsinki (Finland), 11-15 Sep 1989). In *Conference on climate and water: Volume 1.* 520p. Order Number DE93721620. Source: OSTI; NTIS.

A significance of synoptic variations over time-scales of 10-100 years for inputs of acidic ions to catchment hydrochemical systems is investigated. A methodology is presented for the use of the Lamb's Weather Type register to both reconstruct and to predict future rainfall amounts and acidities. A number of tentative predictions are made for the East Midlands, U.K. on the basis of recent and contemporary synoptic trends.

1515 (SA-PUB–9/89-Vol.1, pp. 300-318) **Snow and ice - nonrenewable natural resources in the future.** Kuusisto, E. (National Board of Waters and the Environment, Helsinki (Finland)). Academy of Finland, Helsinki (Finland). 1989. (CONF-8909491–Vol.1: Conference on climate and water, Helsinki (Finland), 11-15 Sep 1989). In *Conference on climate and water: Volume 1.* 520p. Order Number DE93721620. Source: OSTI; NTIS.

The Earth's climate will change in the next decades - possibly at a rate seldom exceeded in the past. The group of hydrological variables most sensitive to climatic changes will be the cryospheric ones, i.e. those related to snow and ice. Their relationship to the climatic system is discussed.

1516 (SA-PUB–9/89-Vol.1, pp. 319-328) **Influence of glacierisation on the response of runoff from Alpine basins to climate variability.** Collins, D.N. (Univ. of Manchester (GB). Alpine Glacier Project). Academy of Finland, Helsinki (Finland). 1989. (CONF-8909491–Vol.1: Conference on climate and water, Helsinki (Finland), 11-15 Sep 1989). In *Conference on climate and water: Volume 1.* 520p. Order Number DE93721620. Source: OSTI; NTIS.

Records of runoff from gauges on rivers draining basins of between 1.9 and 66,6 % glacier-cover in the Rhone catchment, Switzerland have been examined together with records of air temperature and precipitation in the period 191O-1987. Precipitation was more variable from year to year than thermal input. At higher levels of glacierisation, energy input dominates runoff variability, but at low levels precipitation variation is the main influence. Considerable variations in discharge from highly-glacierised basins have resulted from underlying secular variations in energy inputs.

1517 (SA-PUB–9/89-Vol.1, pp. 329-338) **150 years since C.G. Haellstoem's studies on ice break-up dates as climatic indicators.** Kajander, J.M. (Water and Environment Research Institute, Helsinki (Finland)). Academy of Finland, Helsinki (Finland). 1989. (CONF-8909491–Vol.1: Conference on climate and water, Helsinki (Finland), 11-15 Sep 1989). In *Conference on climate and water: Volume 1.* 520p. Order Number DE93721620. Source: OSTI; NTIS.

In 1839, a lecture on using the ice break-up dates as indicators of climatic change was given in the monthly session of the Finnish Society of Sciences by Gustaf Gabriel Haellstroem. In the three research reports by him, the problem is for the first time approached by applying regression analysis. This method is still relevant and now much easier to use. The results of Haellstroem are discussed and a similar analysis is made for the much more extensive 20th century Finnish material. The results show some significant local warming trends but no common pattern.

1518 (SA-PUB–9/89-Vol.1, pp. 339-352) **Simulation of the effects of climate changes on a glacier in Western Norway.** Laumann, T. (Norwegian Water Resources and Energy Administration, Oslo (Norway)); Tvede, A.M. Academy of Finland, Helsinki (Finland). 1989. (CONF-8909491–Vol.1: Conference on climate and water, Helsinki (Finland), 11-15 Sep 1989). In *Conference on climate and water: Volume 1.* 520p. Order Number DE93721620. Source: OSTI; NTIS.

The paper presents a model system used to simulate the effects from climate changes on a glacier named Graabreen at the Folgefonni ice cap in Western Norway. One part of the system calculates the annual net balance of the glacier from input of air temperature and precipitation data from Bergen, the other part simulates the physical conditions of the ice-masses and the advance or retreat of the glacier front. Four scenarios of climate changes are tested, two of which give as result an advancing glacier after year 2002, while the two others gave a retreating glacier. The simulations show that the glacier is sensitive to changes in the precipitation pattern in the fall.

1519 (SA-PUB–9/89-Vol.1, pp. 365-391) **Effects of climate variability and change on fresh water bodies.** Liebscher, H. (Bundesanstalt fuer Gewuesserkunde, Koblenz (Germany, F.R.)). Academy of Finland, Helsinki (Finland). 1989. (CONF-8909491–Vol.1: Conference on climate and water, Helsinki (Finland), 11-15 Sep 1989). In *Conference on climate and water: Volume 1.* 520p. Order Number DE93721620. Source: OSTI; NTIS.

An overview of the possible impacts of climatic changes on surface waters and on the planning of water-resources systems is presented. The most important current international programmes for investigating these impacts are described. Necessary research and other related activities for filling gaps of knowledge are pointed out.

1520 (SA-PUB–9/89-Vol.1, pp. 426-436) **Estimating the impacts of climatic change on river flows; some examples from Britain.** Arnell, N. (Institute of Hydrology, Wallingford (GB)); Reynard, N. Academy of Finland, Helsinki (Finland). 1989. (CONF-8909491–Vol.1: Conference on climate and water, Helsinki (Finland), 11-15 Sep 1989). In *Conference on climate and water: Volume 1.* 520p. Order Number DE93721620. Source: OSTI; NTIS.

Future climatic changes may have a very significant effect on water resource availability, and the results from studies of possible impacts will facilitate efficient resource management. The sensitivities of average annual runoff in Britain to changes in annual precipitation and evaporation have been examined using a regional relationship, and it has been shown that changes in runoff are much more sensitive to changes in precipitation. The greatest sensitivity is found in the drier south east. A simple regression model was used to generate time series of monthly flows under current and perturbed climates at several sites in Britain. Flow seasonality was shown to increase in a warmer, wetter world, and flows in groundwater catchments may be sustained during drier summers by greater winter and spring rainfall totals.

1521 (SA-PUB–9/89-Vol.1, pp. 437-449) **Climate-induced effects on the water balance: Preliminary results from studies in the Vaerpinge experimental research basin.** Berndtsson, R. (Lund Univ. (Sweden). Dept. of Water Resources Engineering); Larson, M.; Lindh, G.; Malm, J.; Niemczynowicz, J.; Zhang, T. Academy of Finland, Helsinki (Finland). 1989. (CONF-8909491–Vol.1: Conference on climate and water, Helsinki (Finland), 11-15 Sep 1989). In *Conference on climate and water: Volume 1.* 520p. Order Number DE93721620. Source: OSTI; NTIS.

The present study focuses upon the effects of anthropogenic-induced climatic change on monthly water balances. Observed monthly water balances during ten years and different future climatic scenarios were used to calculate the effects on runoff and soil moisture storage. It is shown that an annual precipitation increase of 20 % and an overall annual increase in temperature of 2 deg C results in a more than 50 % increase in annual runoff. It is also shown that an increased precipitation is balanced by an increased evapotranspiration not affecting the summer soil water

storage. However, a decrease in precipitation combined with a temperature increase will considerably effect the soil water storage and hence the availability of plant water. Further and more detailed studies are outlined.

1522 (SA-PUB–9/89-Vol.1, pp. 450-461) **Long-term trends in river flow in Finland.** Hyvaerinen, V. (Water and Environment Research Institute, Helsinki (Finland). Hydrological Office); Leppaejaervi, R. Academy of Finland, Helsinki (Finland). 1989. (CONF-8909491–Vol.1: Conference on climate and water, Helsinki (Finland), 11-15 Sep 1989). In *Conference on climate and water: Volume 1.* 520p. Order Number DE93721620. Source: OSTI; NTIS.

A selection of long-term Finnish discharge observation series has been analyzed. Annual discharges have generally increased slightly in most of Finland and especially in the 1980s, but it is too early to decide if this is due to climatic change or to climatic fluctuations. Winter discharges have increased by as much as 20 per cent in some Finnish lakes during the 20th century. This trend is in line with results of climate models, which suggest that both precipitation and temperature are increasing as a result of atmospheric greenhouse effect, especially at northern latitudes in winter.

1523 (SA-PUB–9/89-Vol.1, pp. 462-475) **Water balance investigations in Swiss Alpine basins - tool for the improved understanding of impacts of climatic chance on water resources.** Schaedler, B. (Swiss National Hydrological and Geological Survey, Bern (Switzerland)). Academy of Finland, Helsinki (Finland). 1989. (CONF-8909491–Vol.1: Conference on climate and water, Helsinki (Finland), 11-15 Sep 1989). In *Conference on climate and water: Volume 1.* 520p. Order Number DE93721620. Source: OSTI; NTIS.

Runoff-data series of 70 to 90 years for 9 small- to medium-size research basins in different regions of Switzerland are discussed. The different altitude and geology of these basins result in specific hydrological response, depending on the climatic variation in this century. For the River Rhine data series of the water balance components for 450 years are estimated from climatological proxy-data and compared with reconstructed runoff-data from water level observations and with precipitation measurements. Within that time, the recent period seems to be the warmest and wettest one. Therefore, there is no other period which could give any indications for the changes of water resources with future potential CO_2-induced climate change.

1524 (SA-PUB–9/89-Vol.1, pp. 476-485) **Gradual climate change and resulting hydrologic response.** Singh, K.P. (Illinois State Water Survey, Champaign (US)); Ramamurthy, G.S. Academy of Finland, Helsinki (Finland). 1989. (CONF-8909491–Vol.1: Conference on climate and water, Helsinki (Finland), 11-15 Sep 1989). In *Conference on climate and water: Volume 1.* 520p. Order Number DE93721620. Source: OSTI; NTIS.

For the last 20 years the northern part of the state of Illinois has been experiencing a wetter and cooler climate than in the past. This climate change has increased river flows and flood peaks, resulting in increased streambed and bank erosion, higher groundwater levels in levee-protected farmlands, and decreased freeboard for the levees. The climate changes considered over 20- to 40-year periods and associated changes in hydrology require careful consideration in design and development of water resources to meet the design purposes, even through the periods of climate changes.

1525 (SA-PUB–9/89-Vol.1, pp. 486-500) **The effect of climate variability and change on groundwater in Europe.** Thomsen, R. (Aarhus Amtskommune, Hoejbjerg (Denmark). Miljoekontoret). Academy of Finland, Helsinki (Finland). 1989. (CONF-8909491–Vol.1: Conference on climate and water, Helsinki (Finland), 11-15 Sep 1989). In *Conference on climate and water: Volume 1.* 520p. Order Number DE93721620. Source: OSTI; NTIS.

In Europe groundwater is the most important freshwater resource for public water supply and industry. Analysis of European rainfall show that rainfall variates with time. Research in Denmark shows that groundwater responds to climatic variation. The paper show that southwest Scandinavia, western and northeast France as well as Belgium can expect a decrease in groundwater recharge. In some parts of Europe this decrease will have catastrophic effects for the local water industry. Water resource planning and future monitoring of the water balance and water quality must be based on hydrological models and the use of long timeseries. Basic research on climatic change is thus of great and immediate practical importance for economic development in Europe.

1526 (SA-PUB–9/89-Vol.1, pp. 511-520) **Impact of climate change on groundwater recharge.** Sharma, M.L. (Commenwealth Scientific and Industrial Resources Organization, Wembley (Australia). Division of Water Resources). Academy of Finland, Helsinki (Finland). 1989. (CONF-8909491–Vol.1: Conference on climate and water, Helsinki (Finland), 11-15 Sep 1989). In *Conference on climate and water: Volume 1.* 520p. Order Number DE93721620. Source: OSTI; NTIS.

A mechanistic model, considering soil-plant-atmosphere interactions, was applied to simulate recharge rates beneath an annual grassland, and a perennial pine plantation, growing on sandy soil profiles representative of the Swan Coastal Plain of Western Australia. The sensitivity of the recharge (R) predicted by the model to changes in rainfall (P) was evaluated for a period of twelve months using measured daily rainfall and its variation. Simulations showed that recharge was modified by a much larger proportion than rainfall, and this was greatly influenced by land use. For example a 20 % change in P modified R by +- 30 % beneath the grassland and by +- 120 % beneath the pine plantation. The depth of rooting in relation to the water table had a significant effect on such modifications. Implications of possible modifications in recharge due to the greenhouse effect are explored in relation to the groundwater resources of an important sandy aquifer.

1527 (SA-PUB–9/89-Vol.2) **Conference on climate and water: Volume 2.** Huttunen, L. (ed.). Academy of Finland, Helsinki (Finland). 1989. 393p. (CONF-8909491–Vol.2: Conference on climate and water, Helsinki (Finland), 11-15 Sep 1989). Order Number DE93721621. Source: OSTI; NTIS.

This book contains the Proceedings of the Conference on Climate and Water under the following groupings: Impacts of climatic variability and change-resulting from the changes in hydrological variables; Aquatic environment; Terrestrial environment; Coastal zones and navigation; Urban and industrial water supply and drainage; Energy production; Intropogenic changes of climate and water management problems; Flood potential; Irrigation and land drainage.

1528 (SA-PUB–9/89-Vol.2, pp. 79-88) **A complex model for environmental qualifying.** Koris, K. (Budapest University for Technology, Budapest (Hungary). Dept. for Water Resources Management). Academy of Finland, Helsinki (Finland). 1989. (CONF-8909491–Vol.2: Conference on climate and water, Helsinki (Finland), 11-15 Sep 1989). In *Conference on climate and water: Volume 2.* 393p. Order Number DE93721621. Source: OSTI; NTIS.

A quantitative characterization of the environmental situation is an important information whenever a judgment of the environment's quality is formed or investments are planned or decisions are to be supported. Such a quantitative qualification of the environment may play an important role even on a regional - e.g., European - scale, when forming an opinion on the quality of the given region's environment or preparing regional strategies for environment protection or signing pacts for regional protection of the environment. The model and numerical example, to be shown in this paper, describe the environment of a minor region by a parameter system of water, air, and soil quality. It is a task of the future to include ecological /biological/and social /economical/components into the model. In such a way, the model is an approximative measure of the environment's state, comparing the latter with similarly computed quality categories, i.e., classifying the given state. If any of the quality parameters changes /e.g., the NO_x emission of a country is reduced/, the environment's quality changes as well and the numerical value of this change can be expressed by the model. It may even be possible, after a suitable modification of the model, to characterize quantitatively regional climate changes.

1529 (SA-PUB–9/89-Vol.2, pp. 290-309) **Environmental impact on climate due to man made reservoirs.** Rossi, G.

(National Electricity Board of Italy, Venezia (Italy). Studies and Research Dept.). Academy of Finland, Helsinki (Finland). 1989. (CONF-8909491–Vol.2: Conference on climate and water, Helsinki (Finland), 11-15 Sep 1989). In *Conference on climate and water: Volume 2.* 393p. Order Number DE93721621. Source: OSTI; NTIS.

The impact on the environment due to the building and the management of a hydroelectric reservoir covers many aspects ranging from human and social to hydrologic, agricultural and climatic ones. The overall parameters that may represent both the climatic regime and the vegetation fitness are evaporation and evapotranspiration; they are the keystones of the feedback processes involving the lower atmosphere layer, solar energy fluxes, heat and water exchanges, surface and subsurface fluxes and transpiration strength. The method adopted to calculate evapotranspiration, usually on a monthly scale, is derived from the complementary relationship by F.I. Morton which relates regional and potential evapotranspiration (Eta and Etp) with regional evapotranspiration in saturated conditions (Etv), through an index depending on the water availability. By this procedure it is possible to make-up climatic indexes involving both evapotranspiration and evaporation. The problem of the evaluation of the environmental impact may be approached by two strategies depending on climatological data availability: Historical series if climatological data has been recorded over a long period before the reservoir is put into operation; Witness basin when climatological data are available only after the reservoir has started operating, gathering data both from the basin under control and from a witness basin, in the neighbourhood of the former but not influenced by the reservoir, presumed to have the same regional evapotranspiration. The impact on the environment may be evaluated analysing the trend of such indexes before and after the reservoir operation, following the first strategy, and by the comparison of the two sets of the indexes calculated for the same period, following the second strategy.

1530 (SA-PUB–9/89-Vol.2, pp. 310-347) **Anthropogenic changes or climate, water resources and water management problems.** Shiklomanor, I.A. (State Hydrological Institute, Leningrad (USSR)). Academy of Finland, Helsinki (Finland). 1989. (CONF-8909491–Vol.2: Conference on climate and water, Helsinki (Finland), 11-15 Sep 1989). In *Conference on climate and water: Volume 2.* 393p. Order Number DE93721621. Source: OSTI; NTIS.

The importance of the problem is shown on the study of the hydrological cycle in the conditions of the anthropogenic changes of the global climate resulted from higher concentrations of 'greenhouse' gases in the atmosphere. Methodological approaches are considered as well as basic data and prerequisites used by different scientists to evaluate and predict the effect of climatic changes on water resources and on hydrological regime. The results obtained for different physiographic regions of the world are given and analyzed, including the latest data on the forecasts of river runoff changes for the USSR territory by the end of the present century. General considerations on the effect of the expected climatic changes on water supply, control and water transfers are presented. The results of computations of the future water level in the Caspian Sea are given with the account of possible anthropogenic changes of the global climate.

1531 (SA-PUB–9/89-Vol.2, pp. 348-356) **Flood potential, an uncertain estimate resulting from climatic variability and change.** Nobilis, F. (Hydrographisches Zentralbuero, Vienna (Austria)). Academy of Finland, Helsinki (Finland). 1989. (CONF-8909491–Vol.2: Conference on climate and water, Helsinki (Finland), 11-15 Sep 1989). In *Conference on climate and water: Volume 2.* 393p. Order Number DE93721621. Source: OSTI; NTIS.

The paper tries to give hints for future flood potential respectively its change in connection with climate variability and change. As a matter of fact there are only few quantitative results, moreover the present model properties are not apt to give regionally limited information. It will be necessary to intensify the efforts in research because of the potential danger for man and the financial effect.

1532 (SA-PUB–9/89-Vol.2, pp. 357-371) **Impact of climate variability and change on water resource management in agriculture.** Nemec, J. (Swiss Federal Institute of Technology, Zuerich (Switzerland). Dept. of Geography). Academy of Finland, Helsinki (Finland). 1989. (CONF-8909491–Vol.2: Conference on climate and water, Helsinki (Finland), 11-15 Sep 1989). In *Conference on climate and water: Volume 2.* 393p. Order Number DE93721621. Source: OSTI; NTIS.

The impact on water resources management is considered in the framework of general impact on agricultural land production and the need of its increase due to population growth by the end of this and beginning of next century. Some methodologies to assess this latter impact are described. It is furthermore considered that water resources management in agriculture is presenting a second aspect as a subset of impact of climate change on water resources. Since the water needs of crops are managed mainly by irrigation and to a lesser extent by drainage, the present situation of this management is reviewed and projections of needs are proposed. Concrete methodologies for assessment of climate change impact on the irrigation management are described and a proposal is made for assessment of impact by use of agroecological zoning and related food production potential.

1533 (SA-PUB–9/89-Vol.2, pp. 372-382) **An assessment of climatic changes impacts on water resources management in an irrigated zone.** Pryazhinskaya, V.G. (USSR Academic of Sciences, Moscow (USSR) Water Problems Institute). Academy of Finland, Helsinki (Finland). 1989. (CONF-8909491–Vol.2: Conference on climate and water, Helsinki (Finland), 11-15 Sep 1989). In *Conference on climate and water: Volume 2.* 393p. Order Number DE93721621. Source: OSTI; NTIS.

The methodology for an assessment of climatic changes impacts on water resources management on a regional scale is based on the application of forecasting models. Regional and global climatic changes impacts are simulated with regard to the internal links in the natural-social-economic system. An application of optimization and simulation models to the evaluation of various production allocation alternatives under changing climatic scenarios with regard to some environmental impacts of agriculture is discussed.

1534 (SNV–4045) **The greenhouse gases: Emissions and countermeasures in an international perspective.** Swedish Environmental Protection Agency, Solna (Sweden). Dec 1991. 150p. Order Number DE93721674. Source: OSTI; NTIS.

Also availabe in Swedish as SNV-4011.

This report to the Swedish government aims at describing the factual basis of the greenhouse gas problem. Methods to account for the greenhouse gas emissions are treated, including the possibility to smooth out randomized yearly fluctuations in air temperature and precipitation. The 1990 emission of greenhouse gases are illustrated and forecasting has been done to AD 2000. (22 figs.).

1535 (UCRL-JC–111820) **Aerosol transport and global models.** Penner, J.E. Lawrence Livermore National Lab., CA (United States). Sep 1992. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-9209246–1: National Aeronautics and Space Administration (NASA) workshop on global aerosols and biogeochemistry, Orlando, FL (United States), 1-3 Sep 1992). Order Number DE93001618. Source: OSTI; NTIS; GPO Dep.

Recently, attention has been focused mainly on the effects of anthropogenic aerosols on climate. Anthropogenic aerosols may cool the climate by direct reflection of solar radiation and by their effect on clouds. This report discusses the effects of several components on global models, and discusses the transport of these aerosols.

1536 (WSRC-MS–92-211) **Performing wind-tunnel modeling for better management of near-field risks.** Huang, Ju-Chrong; Weber, A.H. Westinghouse Savannah River Co., Aiken, SC (United States). [1992]. 21p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. (CONF-9208117–12: 1992 Energy Facility Contractors Group (EFCOG) safety anaiysis workshop, Salt Lake City, UT (United States), 11-13 Aug 1992). Order Number DE92040205. Source: OSTI; NTIS; INIS; GPO Dep.

All industrial complexes must be able to demonstrate that air pollutant concentrations from normal and accidental releases are within the bounds of stringent acceptance criteria. The offsite concentrations are comparatively easy to compute with the standard Gaussian models. By contrast, the onsite (in particular, near-field) concentrations can be more complex since the wind flows can interact with various structures in complex ways to create regions of relatively high local concentrations. Three methods can be used to predict the air pollutant concentrations: (1) mathematical models, (2) field experiments, and (3) fluid models (wind-tunnel testing). The complex flow in the vicinity of buildings is not amenable to simple mathematical generalizations. Field experiments cannot encompass the wind spectrum of meteorological conditions in the time generally allotted. Wind tunnel testing works best where numerical models fail and field testing is not applicable. This paper covers the following aspects related to the wind-tunnel modeling studies: (1) planning strategies; (2) types of wind-tunnel modeling studies flow visualization and concentration measurement experiments; (3) highlights (video tape show) of the wind tunnel experiments; (4) technical challenges; and (5) various applications.

1537 (Y/ENG/SE–109) **Atmospheric transport analysis used in hazard screening methodology.** Bloom, S.G. Oak Ridge Y-12 Plant, TN (United States). 29 Jun 1992. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OS21400. (CONF-921110–28: Winter annual meeting of the American Society of Mechanical Engineers (ASME), Anaheim, CA (United States), 8-13 Nov 1992). Order Number DE92041267. Source: OSTI; NTIS; GPO Dep.

Simple, but conservative, atmospheric transport models are used in the initial stages of a hazard screening methodology to determine a preliminary hazard rank. The hazard rank is one indicator of the additional effort, if any, that must be applied to determine if a system is safe. Simple methods avoid prolonged calculations at this early stage when details of potential accidents may be poorly defined. The models are used to simulate the consequences resulting from accidental releases of toxic substances. Instantaneous and constant-rate releases are considered. If a release takes place within a relatively small enclosure, the close-in transport is approximated by assuming the airborne material is instantaneously mixed with the volume of air within this enclosure. For all other situations and large distances, the transport is estimated with simple atmospheric dispersion models using published values of dispersion coefficients for large distances, and values based on turbulent diffusion theory for close-in distances. Consequences are assessed by defining exposure levels that are equivalent to negligible, reversible, and irreversible health effects. The hazard rank is related to the number and location of people within each category of health effects.

1538 (YMP-BOOKL–15/1989) **Air quality management in Finland.** Ministry of the Environment, Helsinki (Finland). Environmental Protection Dept. 1989. 31p. Order Number DE93711146. Source: OSTI; NTIS.

In 1985, the Finnish Ministry of the Environment published a booklet entitled 'Air Quality Management in Finland'. Since then, air pollution control has developed rapidly and new information is required. It has proved necessary to compile a revised booklet of air pollution control in Finland, to include the measures that have been taken domestically and internationally significant decisions on air pollution control. In this booklet, the main emphasis is upon reporting on emissions, steps that have been taken to limit emissions, and results obtained in reducing them. There is no detailed information on air quality in urban areas in this booklet, a deficiency which, naturally, limits the overall picture. An air quality management data base currently being developed will correct this deficiency in future publications.

1539 (YMP-BROCH–39/1991) **Adification research in Finland: Review of the results of the Finnish adification research programme (HAPRO) 1985-1990.** Kenttaemies, K. Ministry of the Environment, Helsinki (Finland). Environmental Protection Dept. 1991. 48p. Order Number DE93711149. Source: OSTI; NTIS.

Storing of birch wholetree chips was studied on the south west side of Lokka reservoir, in Sodankylae at latitude 68 degrees north. The purpose of the study was to examine the effects of storing time, cover and underbase on pile temperature, wood moisture, dry matter losses and heat value. Two 3000 m^2 loose piles were made to carry out the study. The dry matter losses were found to increase with time. Chips under plastic cover were found to suffer greater losses than those without cover. The use of cover also increased wood moisture content. When using plastic underbase the long storage periods seem to cause some of the moisture to collect on the bottom part of the pile. Hence it follows that the use of plastic as a cover and underbase material can not be justified. On one hand the increase in moisture content caused by the treatment and increased storage time and on the other hand the mixing of mineral soil with fuel chips had a negative effect on the heating value.

1540 (YMP-D–34/1987) **Intercalibration of sulfur dioxide monitors: Intercalibration of monitors.** Walden, J.; Laettilae, H.; Hyppoenen, M.; Plathan, P.; Virtanen, T. Ministry of the Environment, Helsinki (Finland). Environmental Protection Dept. 1987. 105p. (In Finnish). Order Number DE93711134. Source: OSTI; NTIS.

These tests showed that although the monitors are continuously functioning, they need to be kept under surveillance; the maintenance schedules should be followed regularly according to the manuals. The length of these tests was not sufficient to give statisfactory information about the operational reliability. During the test period, however, there were no very significant malfunctionings in the operation of the monitors.

1541 (YMP-D–49/1988) **Level of dioxin emissions and measurement techniques in Finland: A literature review.** Tirkkonen, T. (Technical Research Centre of Finland, Espoo (Finland). Chemical Lab.); Laukkarinen, A. Ministry of the Environment, Helsinki (Finland). Environmental Protection Dept. 1988. 67p. (In Finnish). Order Number DE93711138. Source: OSTI; NTIS.

This report includes preliminary estimates concerning dioxin emissions from a limited number of sources in Finland. The estimates are based on domestic measurements as well as on estimates and measurements done in other countries, especially in Sweden and Germany. In Finland different institutions are developing sampling and analysis methods for dioxins.

1542 (YMP-D–55/1988) **Second workshop on integrated monitoring (WIM 2): Workshop report.** Sisula, H.; Soederman, G. (eds.). Ministry of the Environment, Helsinki (Finland). Environmental Protection Dept. 1988. 84p. (CONF-8810561–: WIM 2: 2. workshop on integrated monitoring, Espoo (Finland), 5-8 Oct 1988). Order Number DE93711064. Source: OSTI; NTIS.

The Second Workshop on Integrated Monitoring was held in Espoo, Hanasaari, Finland, 5-8 October 1988. The meeting was attended by participants from fourteen countries and five international organizations. The workshop report contains the unianomously at the closing session adopted Workshop Statement, the list of participants, the programme, the reports of the eight working groups and the opening address as well as the papers given at the plenary sessions. The more detailed results of the workshop are presented in the draft versions of the Methodology Manual produced by the Finnish Environmental Data Centre by the end of 1988.

1543 (YMP-R–64/1989) **The release of cadmium and mercury into the Finnish environment.** Mukherjee, A. (Univ. of Helsinki (Finland). Dept. of Environmental Conservation). Ministry of the Environment, Helsinki (Finland). Environmental Protection Dept. 1989. 93p. Order Number DE93711143. Source: OSTI; NTIS.

The study concerns emissions of cadmium and mercury from industries in Finland. In 1987 the estimated cadmium emissions into air amounted to 3.22 tons, and into water to 1.00 tons. Cadmium emissions into the soil amounted to 147 tons. A comparison of these figures with information from the early 1980s shows diminishing emissions into air and water. In spite of this fact the amount of pollution from the main sources, the metal industry and power plants using fossile fuels, is still relatively high. The increase in total mercury emissions into the environment are due to the high mercury contents of raw materials used in the metal industry and in the power plants, the high mercury contents of batteries and jarosite wastes, and lacking capacity in industry to prevent the escape of mercury fumes and particles from processes.

1544 (AECL–10003) **Analysis of diffusive mass transport in a cracked buffer.** Garisto, N.C.; Garisto, F. Atomic Energy of Canada Ltd., Pinawa, MB (Canada). Whiteshell Nuclear Research Establishment. Nov 1989. 57p. Order Number DE93603554. Source: OSTI; NTIS (US Sales Only); INIS.

In the disposal vault design for the Canadian Nuclear Fuel Waste Management Program, cylindrical containers of used nuclear fuel would be placed in vertical boreholes in rock and surrounded with a bentonite-based buffer material. The buffer is expected to absorb and/or retard radionuclides leaching from the fuel after the containers fail. There is some evidence, however, that the buffer may be susceptible to cracking. In this report we investigate numerically the consequences of cracking on uranium diffusion through the buffer. The derivation of the mass-transport equations and the numerical solution method are presented for the solubility-limited diffusion of uranium in a cracked buffer system for both swept-away and semi-impermeable boundary conditions at the rock-buffer interface. The results indicate that for swept-away boundary conditions the total uranium flux through the cracked buffer system is, as expected, greater than through the uncracked buffer. The effect of the cracks is strongly dependent on the ratio D/D_{eff}, where D and D_{eff} are the pore-water and the effective buffer diffusion coefficient, respectively. However, although a decrease in D_{eff} enhances the effect of cracks on the total cumulative flux (relative to the uncracked buffer), it also decreases the total cumulative flux through the cracked buffer system (relative to a cracked buffer with a larger D_{eff} value). Finally, for semi-impermeable boundary conditions, the effect of cracks on the total radionuclide flux is relatively small.

1545 (AECL–10068) **MCDIRC: A model to estimate creep produced by microcracking around a shaft in intact rock.** Wilkins, B.J.S.; Rigby, G.L. Atomic Energy of Canada Ltd., Pinawa, MB (Canada). Whiteshell Nuclear Research Establishment. Dec 1989. 30p. Order Number DE93605431. Source: OSTI; NTIS (US Sales Only); INIS.

Atomic Energy of Canada Limited (AECL) is studying the concept of disposing of nuclear fuel waste in a vault in plutonic rock. Models are being developed to predict the mechanical behaviour of the rock in response to excavation and heat from the waste. The dominant mechanism of deformation at temperatures below 150 degrees C is microcracking, which results in rock creep and a decrease in rock strength. A model has been constructed to consider the perturbation of the stress state of intact rock by a vertical cylindrical opening. Slow crack-growth data are used to estimate time-dependent changes in rock strength, from which the movement (creep) of the opening wall and radial strain in the rock mass can be estimated.

1546 (AECL–10169) **In situ stress determination by the overcoring of large surface strain gauge rosettes on the walls of a raise-bored shaft at the Underground Research Laboratory.** Chandler, N.A. Atomic Energy of Canada Ltd., Pinawa, MB (Canada). Whiteshell Nuclear Research Establishment. Aug 1991. 56p. Order Number DE93603571. Source: OSTI; NTIS (US Sales Only); INIS.

AECL Research is conducting a series of experiments to examine the influence of scale on measured in situ stresses in granite rock. The ventilation raise rosette overcoring experiment is one such test. This experiment, modelled on a previous test conducted in Australia, consisted of overcoring four 120-mm strain gauge rosettes glued to the surface of a 1.8-m-diameter bored raise. The in situ stresses were calculated from the measured strains using the equations for stresses around a cylindrical excavation in an elastic material. The possibility of excavation disturbance around the ventilation raise was investigated using overcore stress measurements, elastic modulus tests on retrieved core, and visual inspection of thin sections obtained from removed core. The effect of a stress-dependent elastic modulus (referred to as non-linear elastic behaviour) is also addressed. Results from the ventilation raise rosette overcoring experiment suggest that rosette overcoring in a bored raise is an acceptable stress-measurement method. The effects of scale and excavation damage on the stress measurements were not considered to be significant; however, if the elastic modulus of the rock is strongly stress-dependent, non-linear elastic behaviour may have a small effect on the measured stresses.

1547 (AECL–10182) **The link between performance assessment and quality of data.** Csullog, G.W. Atomic Energy of Canada Ltd., Chalk River, ON (Canada). Chalk River Nuclear Labs. Nov 1990. 16p. (CONF-9005332–: 2. International Seminar on Radioactive Waste Products, Juelich (Germany), 28 May - 1 jun 1990). Order Number DE93603555. Source: OSTI; NTIS (US Sales Only); INIS.

Performance assessments, using both individual and cumulative inventories, produce estimates of the risk or dose consequences for repository concepts. Unacceptable risk or dose for a given contaminant identify it as a problem contaminant. While risk or dose consequences are common outputs of safety assessments, results can also be reported as estimates of the safe inventory limit for each contaminant in a repository scenario. Once problem contaminants are identified, it may be useful to: validate the data used in the performance assessment; restrict contaminant inventories in the repository; or, improve the containment capability of the repository (including improved packaging). A key point is that performance assessments define the quality of data to be collected. If a contaminant's inventory will be far below its estimated safe inventory limit for a repository, then it is reasonable to accept inventory estimates that have high variances and low confidence. For contaminants that have a significant impact upon performance assessments, efforts must be made to provide the best inventory (source term) estimates practicable. One important goal of characterization programs should be to establish the adequacy of data used in performance assessments. There is little value in striving to improve confidence in data for some waste streams if they are assessed to have a minor impact upon repository performance. Streams that have a major impact upon performance deserve the time, attention and money to be characterized adequately. Waste acceptance must be linked to the quality of characterization data provided by generators. This link sets compliance monitoring requirements.

1548 (AECL–10277) **A radionuclide mass-transport model for the performance assessment of engineered barriers in a used nuclear fuel disposal vault.** Garisto, N.C.; LeNeveu, D.M. Atomic Energy of Canada Ltd., Pinawa, MB (Canada). Whiteshell Nuclear Research Establishment. Aug 1991. 60p. Order Number DE93603556. Source: OSTI; NTIS (US Sales Only); INIS.

The Vault Model has been developed to assess the performance of engineered barriers in a conceptual disposal vault for used nuclear fuel. The disposal concept being assessed is that of a sealed vault mined at a depth of 500 to 1000 m in plutonic rock in the Canadian Shield. In this report, we describe the conceptual and mathematical framework of the radionuclide mass-transport model used in the Vault Model and discuss the assumptions used in its derivation. The model represents the mass transport of radionuclides released from used-fuel containers, through clay-based sealing materials and into the surrounding rock. It uses one-dimensional diffusion-convection equations for radionuclide transport in a decay chain of arbitrary length, in finite media. The equations are solved semi-analytically using Laplace transform techniques.

1549 (ANL/CP–76923) **Criteria for evaluating the health risk remaining after bioremediation of a buried mass of diesel fuel No. 2.** Rosenblatt, D.H.; Montemagno, C.D. Argonne National Lab., IL (United States). [1992]. 30p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-9209216–1: 7. national conference on hydrocarbon contaminated soils, Amherst, MA (United States), 21-24 Sep 1992). Order Number DE92040745. Source: OSTI; NTIS; GPO Dep.

In February 1975, 59,000 gal of diesel fuel No. 2 were accidentally released from a storage tank at Sandia National Laboratories (SNL), Livermore, California, a Department of Energy facility. Over succeeding years, the fuel migrated downward. The present study was intended (1) to delineate the current threat to groundwater

quality and (2) to provide a means to evaluate the potential effect on groundwater of a presumed hydrocarbon residue after bioremediation. The release resulted from the accidental puncture of an underground transfer line buried 4 ft below the surface; a small amount of fuel oil was recovered from a 2-ft-deep light pole trench near the puncture. Most of the spill traveled laterally and downward, reaching the unconfined aquifer, which subsequently receded. The oil plume lies mainly at a depth of 10–100 ft, within a 30- to 100-ft radius of the spill point. None of the fuel contaminated the soil surface; hence, the only significant future exposure would be expected to occur through drinking water from a hypothetical well just downgradient of the spill site and drilled into the uppermost water-bearing zone. Such a well is possible but is unlikely because of the very low groundwater yield and poor water quality.

1550 (ANL/RP–76697) **Technical action plan at former Commodity Credit Corporation grain storage sites in Nebraska and Kansas.** Argonne National Lab., IL (United States). Jan 1992. 13p. Sponsored by Department of Agriculture, Washington, DC (United States). DOE Contract W-31109-ENG-38. Order Number DE92040715. Source: OSTI; NTIS; GPO Dep.

This document has been prepared for the Commodity Credit Corporation of the US Department of Agriculture (CCC/USDA) to provide an outline for a multiyear plan for technical investigations at sites in Kansas and Nebraska that have been identified as having groundwater contamination. Carbon tetrachloride is the primary contaminant of concern at sites in Nebraska and Kansas where former CCC/USDA grain storage facilities were located.

1551 (CONF-9106396–1) **Global climate change: Some implications, opportunities, and challenges for US forestry.** Marland, G. Oak Ridge National Lab., TN (United States). [1991]. 16p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From 21. Southern forest tree improvement conference (SFTIC); Knoxville, TN (United States); 17-20 Jun 1991. Order Number DE92040874. Source: OSTI; NTIS; INIS; GPO Dep.

It is widely agreed that the concentration of greenhouse gases in the earth's atmosphere is increasing, that this increase is a consequence of man's activities, and that there is significant risk that this will lead to changes in the earth's climate. The question is now being discussed what, if anything, we should be doing to minimize and/or adapt to changes in climate. Virtually every statement on this matter; from the US Office of Technology Assessment, to the National Academy of Science, to the Nairobi Declaration on Climatic Change, includes some recommendation for planting and protecting forests. In fact, forestry is intimately involved in the climate change debate for several reasons: changing climate patterns will affect existing forests, tropical deforestation is one of the major sources of greenhouse gases to the atmosphere, reforestation projects could remove additional carbon dioxide from the atmosphere and there is renewed interest in wood-based or other renewable fuels to replace fossil fuels. Part of the enthusiasm for forestry-related strategies in a greenhouse context is the perception that forests not only provide greenhouse benefits but also serve other desirable social objectives. This discussion will explore the current range of thinking in this area and try to stimulate additional thinking on the rationality of the forestry-based approaches and the challenges posed for US forestry.

1552 (CONF-921207–1) **Environmental emissions from biomass energy feedstocks.** Perlack, R.D.; Ranney, J.W.; Wright, L.L. Oak Ridge National Lab., TN (United States). [1992]. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From American Society of Agricultural Engineers alternate energy conference; Nashville, TN (United States); 14-15 Dec 1992. Order Number DE92040029. Source: OSTI; NTIS; INIS; GPO Dep.

Study results indicate the total emissions from energy crop production, harvesting, and transport are relatively small. CO_2 emissions are an order of magnitude lower than those for liquid petroleum fuels. The environmental impacts from agricultural chemical use and erosion are also small. However, their exact level depends greatly on the type of land and the crops displaced.

1553 (DOE/BP/07096–2) **System-wide significance of predation on juvenile salmonids in the Columbia and Snake River reservoirs: Annual report of research 1991.** Shively, R.S.; Tabor, R.A.; Nelle, R.D.; Jepsen, D.B.; Petersen, J.H.; Sauter, S.T.; Poe, T.P. Fish and Wildlife Service, Portland, OR (United States). Columbia River Field Station. 1991. 56p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AI79-90BP07096. Order Number DE92040931. Source: OSTI; NTIS; GPO Dep.

We indexed consumption rates of northern squawfish (Ptychoch oregonensis) preying upon juvenile salmonids in four lower Snake River reservoirs. Stomach contents were also collected from smallmouth bass (Micropterus dolomieui), channel catfish (Ictaluris gunctatus), and walleye (Stizostedion vitreum). Northern squawfish digestive tracts were analyzed and the overall diet (% weight) was dominated by fish and crustaceans. Examination of stomach contents smallmouth bass showed that crustaceans (primarily crayfish) dominated their diets. Overall, the consumption rate of juvenile salmonids by smallmouth bass was low. The northern squawfish consumption index (CI) at Snake River locations ranged from zero at all mid-reservoir locations to 1.2 at Lower Granite forebay. In John Day Reservoir, CI values ranged from 0.5 to 1.9 in May and from 0.9 to 3.0 in July. Consumption index values were highest in forebay and tailrace areas, and were slightly higher in BRZs than in non-restricted zones.

1554 (DOE/EH–0283) **Tiger Team Assessment of the Navel Petroleum and Oil Shale Reserves Colorado, Utah, and Wyoming.** USDOE Assistant Secretary for Environment, Safety, and Health, Washington, DC (United States). Jul 1992. 592p. Sponsored by USDOE, Washington, DC (United States). Order Number DE93002602. Source: OSTI; NTIS; GPO Dep.

This report documents the Tiger Team Assessment of the Naval Petroleum Oil Shale Reserves in Colorado, Utah, and Wyoming (NPOSR-CUW). NPOSR-CUW consists of Naval Petroleum Reserve Number 3 located near Casper, Wyoming; Naval Oil Shale Reserve Number I and Naval Oil Shale Reserve Number 3 located near Rifle, Colorado; and Naval Oil Shale Reserve Number 2 located near Vernal, Utah, which was not examined as part of this assessment. The assessment was comprehensive, encompassing environment, safety, and health (ES&H) and quality assurance (QA) disciplines; site remediation; facilities management; and waste management operations. Compliance with applicable Federal, state, and local regulations; applicable DOE Orders; best management practices; and internal NPOSR-CUW requirements was assessed. The NPOSR-CUW Tiger Team Assessment is part of a larger, comprehensive DOE Tiger Team Independent Assessment Program planned for DOE facilities. The objective of the initiative is to provide the Secretary with information on the compliance status of DOE facilities with regard to ES&H requirements, root causes for noncompliance, adequacy of DOE and contractor ES&H management programs, response actions to address the identified problem areas, and DOE-wide ES&H compliance trends and root causes.

1555 (DOE/ER–0390) **Selection of subsoils, saturated zone materials, and related sorbents for subsurface research: Rationale for selection of experimental materials for DOE research in subsoils and in groundwater: Subsurface Science Program.** Ainsworth, C.C.; Zachara, J.M. In collaboration with Dr. Frank J. Wobber. Pacific Northwest Lab., Richland, WA (United States). [1988]. 31p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE92040275. Source: OSTI; NTIS; GPO Dep.

This report describes reference subsoils and aquifer materials that support research in DOE's Subsurface Science Program. Research is being conducted on the geochemical behavior of co-contaminants in the subsurface, for example: (1) the mechanisms of organic contaminant sorption to mineral surfaces; (2) the rates and mechanisms of microbiological degradation of organic contaminants; (3) the flow physics of organic liquids in saturated and unsaturated porous media; (4) the identity and chemical reactivity of colloids in groundwater; and, (5) the physical and chemical nature of absorbed water on mineral surfaces and its role in contaminant binding to sorbent surfaces. Sorption and degradation experiments are performed at the laboratory and intermediate scale using a reference collection of subsurface materials and single

phase components (e.g., clays, oxides, humic substances) which are described herein. This report describes how and why these particular materials were selected as research substrates; the report summarizes the properties of the reference materials as they relate to the vadose and saturated zones and how these materials are being used to understand organic contaminant reactions in the subsurface. The primary set of reference materials is being augmented with (1) samples of opportunity from deeper vadose and saturated zones, and (2) with pure phase organic and mineral solids for fundamental studies of contaminant sorption and degradation mechanisms.

1556 (DOE/ER/60245–T1) **Research on the seasonal snow of the Arctic Slope: Annual progress report, July 15, 1984–January 15, 1986.** Benson, C.S. Alaska Univ., Fairbanks, AK (United States). Geophysical Inst. [1986]. 19p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG06-84ER60245. Order Number DE93001748. Source: OSTI; NTIS; GPO Dep.

This project deals with the seasonal snow on Alaska's Arctic Slope. It is concentrated on snow of the R_4D project area. However, an important aspect of this study is to relate the snow cover of this area with the rest of the Arctic Slope. The goals include determination of the amount of precipitation which comes as snow, the wind transport of this snow and its depositional pattern as influenced by drifting, the physical properties of the snow, the physical processes which operate in it, the proportions of it which go into evaporation, infiltration and runoff, and the biological role of the snow cover.

1557 (DOE/ER/60247–T3) **Active layer hydrology for Imnavait Creek, Toolik, Alaska: Annual progress report, July 1984–January 1986.** Kane, D.L. Alaska Univ., Fairbanks, AK (United States). Water Research Center. [1986]. 47p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG06-84ER60247. Order Number DE93001747. Source: OSTI; NTIS; GPO Dep.

In the annual hydrologic cycle, snowmelt is the most significant event at Imnavait Creek located near Toolik Lake, Alaska. Precipitation that has accumulated for more than 6 months on the surface melts in a relatively short period of 7 to 10 days once sustained melting occurs. During the ablation period, runoff dominates the hydrologic cycle. Some meltwater goes to rewetting the organic soils in the active layer. The remainder is lost primarily because of evaporation, since transpiration is not a very active process at this time. Following the snowmelt period, evapotranspiration becomes the dominate process, with base flow contributing the other watershed losses. It is important to note that the water initally lost by evapotranspiration entered the organic layer during melt. This water from the snowpack ensures that each year the various plant communities will have sufficient water to start a new summer of growth.

1558 (DOE/ER/60253–T5) **Rangeland – Plant responses to elevated CO_2: Progress report.** Owensby, C.E.; Coyne, P.I.; Ham, J.M.; Parton, W.; Rice, C.; Auen, L.M.; Adam, N. Kansas State Univ., Manhattan, KS (United States). Dept. of Agronomy. 1992. 129p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-84ER60253. Order Number DE93000883. Source: OSTI; NTIS; GPO Dep.

Several broad conclusions which can be drawn from the work that was accomplished during the first 3-year phase of the study is described. In prairie ecosystems dominated by C_4 grasses, it is likely that elevated atmospheric CO_2 will increase ecosystem level productivity, with a greater increase in belowground productivity. The increased productivity will primarily result from increased water use efficiency due to the anti-transpirant action of CO_2. Fumigation chambers are directly confounded with elevated CO_2 effects, in that both reduce evapotranspiration. The reduced evapotranspiration of the fumigation chamber is primarily through reduced wind speeds and reduced radiation. In very dry years, fumigation chamber effects are negligible, but in years with normal precipitation, chamber effects and elevated CO_2 effects are essentially equal with respect to reduced evapotranspiration effects. Increased production under elevated CO_2 results in reduced nitrogen concentration in the herbage and increased fiber concentrations. Consequently, digestibility of the herbage is reduced, and microbial degradation of surface litter and soil organic matter is slowed. On the negative side, ruminant productivity will likely be reduced substantially, but increased carbon storage in the soil may buffer against future rise in atmospheric CO_2. Tallgrass prairie will not likely change greatly in botanical composition, since the C_4 dominants responded to elevated CO_2 more than the C_3 subdominants.

1559 (DOE/ER/60612–4) **Nitrogen availability as a control mechanism of secondary succession within a semiarid shrubland ecosystem: Final report, October 1, 1990–June 27, 1992.** Redente, E.F.; McLendon, T. Colorado State Univ., Fort Collins, CO (United States). Dept. of Range Science. 25 Sep 1992. 70p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-87ER60612. Order Number DE93000384. Source: OSTI; NTIS; GPO Dep.

Three experiments were conducted within a semiarid shrubland to test the role of nitrogen availability as a control mechanism in secondary succession. Secondary succession patterns were documented for seven years and effects of increased and decreased N availability levels, fumigation, and competition by early-seral species were tested. Differential responses by seral species were determined and related to successional patterns. Nitrogen availability was found to be a primary mechanism controlling the rate of succession. Relative growth rate was an important factor determining which species initially dominated and N availability became the primary control factor by the third year. As N availability increased, the rate of succession decreased. Conversely, as N availability was decreased, the rate of succession increased. The abundance of annuals was increased and abundance of perennials decreased by increased N availability. Tissue N concentration was related to lifeform and seral position, and these relationships were important in the transition from early- to mid-seral stages. Decomposer subsystem dynamics were correlated with seral community dynamics. The effect of fumigation was minimized by initially planting with late-seral species. A conceptual model of secondary succession is presented based on N availability, relative growth rate, lifeform, and decomposition dynamics.

1560 (DOE/ER/60715–3) **Spatial scaling: its analysis and effects on animal movements in semiarid landscape mosaics: Final report, 1 September 1988–31 May 1992.** Wiens, J.A. Colorado State Univ., Fort Collins, CO (United States). Dept. of Biology. Sep 1992. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-88ER60715. Order Number DE93000896. Source: OSTI; NTIS; GPO Dep.

The research conducted under this agreement focused in general on the effects of envirorunental heterogeneity on movements of animals and materials in semiarid grassland landscapes, on the form of scale-dependency of ecological patterns and processes, and on approaches to extrapolating among spatial scales. The findings are summarized in a series of published and unpublished papers that are included as the main body of this report. We demonstrated the value of "experimental model systems" employing observations and experiments conducted in small-scale microlandscapes to test concepts relating to flows of individuals and materials through complex, heterogeneous mosaics. We used fractal analysis extensively in this research, and showed how fractal measures can produce insights and lead,to questions that do not emerge from more traditional scale-dependent measures. We developed new concepts and theory to deal with scale-dependency in ecological systems and with integrating individual movement patterns into considerations of population and ecosystem dynamics.

1561 (DOE/ER/60842–T1) **Factors affecting transport of bacterial cells in porous media: Technical progress report.** Mills, A.L.; Herman, J.S.; Hornberger, G.M. Virginia Univ., Charlottesville, VA (United States). Dept. of Environmental Sciences. Jul 1992. 3p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG05-89ER60842. Order Number DE93001848. Source: OSTI; NTIS; GPO Dep.

This study focused on identification of factors associated with the biology, chemistry, and hydrology of the subsurface environment that control bacterial transport through that habitat. We determined that control is a complex interaction of biological factors such as cell size and hydrophobicity, geochemical factors such as ionic

strength of the ground water, and hydrological factors including the presence of preferred flow paths in the porous medium.

1562 (DOE/ER/61159–2) **Physiological and phylogenetic study of microbes from geochemically and hydrogeologically diverse subsurface environments: Interim technical report, November 1, 1991–September 30, 1992.** Balkwill, D.L.; Reeves, R.H. Florida State Univ., Tallahassee, FL (United States). Dept. of Biological Science. 1 Oct 1992. 70p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG05-91ER61159 ;FG05-90ER61039. Order Number DE93001846. Source: OSTI; NTIS; GPO Dep.

An important aspect of our ongoing research effort in the DOE Deep Microbiology Program has been the characterization of certain microorganisms in samples of subsurface materials from various DOE production sites. Recently, it was our responsibility to determine the numbers, diversity, morphological characteristics, and physiological traits (including the potential metabolic capabilities) of the viable, aerobic, chemoheterotrophic micro-organisms in samples that were obtained from the Idaho National Engineering Laboratory (INEL) and the Hanford Reservation (HR) in 1990. It was decided that the physiological characteristics of the INEL and HR subsurface microbial isolates would be analyzed during the current project. We describe here the research on physiological characteristics that has been completed during the eleven-month period covered by the present technical report. Approximately 750 microbial strains were isolated by our laboratory from the INEL and HR samples in 1990 and 1991. During the portion of the current project covered by this interim report, all of these strains were tested for their ability to utilize each of 95 different organic compounds as sole sources of carbon. Identifications are based on how well the carbon utilization patterns of the isolates match those of 659 species and subspecies (i.e., established taxa).

1563 (ECN-C–91-066) **Isothermal behaviour of a Gloetzl in the HAW test field.** Benneker, P.B.J.M.; Hamilton, L.F.M. Netherlands Energy Research Foundation (ECN), Petten (Netherlands). May 1991. 23p. Contract nr. F1-1W-0003-D(B). Order Number DE93603572. Source: OSTI; NTIS; INIS.

This work has been performed in the framework of the Commission of the European Communities R and D Programme on Management and Storage of Radioactive Waste.

The HAW test field in the Asse mine (Germany) is a one-to-one scale test facility of an underground repository. One objective of the HAW project is to measure thermally induced stresses and deformation fields in the surrounding rock. Many measuring instruments have been placed in specially drilled holes at various locations to measure pressure change in the test field. One of the types used is the so-called 'Gloetzl' pressure cell. The measuring result of a 'Gloetzl' is a combination of pressure build-up as result of local borehole deformation due to creep and stress changes due to changes in the global field around the measuring borehole. Especially in the isothermal and low temperature situation results are dominated by this local borehole deformation. To understand the measuring results of a 'Gloetzl' better an analysis had been performed in which time-dependent (isothermal) behaviour of the measuring hole is investigated using a finite element program. Delay between borehole drilling and final emplacement of the device into the borehole is varied. From the results it can be obtained that the time between drilling of the hole and 'Gloetzl'-emplacement influences the pressure result for a very long period of time and the recuperation to the boundary stresses needs more than 300 years. Thus, the measuring results of the 'Gloetzls' can not be considered to represent directly the stresses in the field. The behaviour under heated conditions needs more detailed analyses. (author). 2 refs.; 9 figs.

1564 (EMO–1028-Vol.8) **[Environmental investigation of ground water contamination at Wright-Patterson Air Force Base, Ohio]: Volume 8, Focused feasibility study.** Pacific Northwest Lab., Richland, WA (United States). Environmental Management Operations; IT Corp., Cincinnati, OH (United States). Mar 1992. 203p. Sponsored by Department of Defense, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE92040804. Source: OSTI; NTIS; INIS; GPO Dep.

The Phase I, Task 5, Focused Feasibility Study (FFS) has been prepared as part of the Environmental Investigation of Ground Water Contamination Project being conducted by Wright-Patterson Air Force Base (WPAFB). The primary objective of this FFS was to select a cost-effective method of preventing migration of contaminated ground water across the southwestern boundary of Area C of the Base. The FFS presented in this document is a portion of a much larger effort being conducted at WPAFB. The detailed analysis of alternatives for the extraction, treatment, and discharge of contaminated ground water migrating across the southwest boundary of Area C at WPAFB led to the selection of a preferred removal action alternative. Specifically, this alternative is that ground water be extracted utilizing a three well array pumping at a total of 400 to 800 gpm, removed water be treated via air stripping to achieve appropriate effluent concentrations, and treated water be discharged to the Mad River in accordance with a National Pollution Discharge Elimination System (NPDES) permit and other relevant permits.

1565 (EMO–1028-Vol.9) **[Environmental investigation of ground water contamination at Wright-Patterson Air Force Base, Ohio]: Volume 9, Removal action system design.** Pacific Northwest Lab., Richland, WA (United States). Environmental Management Operations; IT Corp., Cincinnati, OH (United States). Apr 1992. 205p. Sponsored by Department of Defense, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE92040805. Source: OSTI; NTIS; INIS; GPO Dep.

This Removal Action System Design has been prepared as a Phase I Volume for the implementation of the Phase II removal action at Wright-Patterson Air Force Base (WPAFB) near Dayton, Ohio. The objective of the removal action is to prevent, to the extent practicable, the migration of ground water contaminated with chlorinated volatile organic compounds (VOCS) across the southwest boundary of Area C. The Phase 1, Volume 9 Removal Action System Design compiles the design documents prepared for the Phase II Removal Action. These documents, which are presented in Appendices to Volume 9, include: Process Design, which presents the 30 percent design for the ground water treatment system (GWTS); Design Packages 1 and 2 for Earthwork and Road Construction, and the Discharge Pipeline, respectively; no drawings are included in the appendix; Design Package 3 for installation of the Ground Water Extraction Well(s); Design Package 4 for installation of the Monitoring Well Instrumentation; and Design Package 5 for installation of the Ground Water Treatment System; this Design Package is incorporated by reference because of its size.

1566 (IC–92/192) **Two-dimensional transport of dust from an infinite line source at ground level: non-zero roughness height.** Hassan, M.H.A. (International Centre for Theoretical Physics, Trieste (Italy)); Eltayeb, I.A. International Centre for Theoretical Physics, Trieste (Italy). Jul 1992. 10p. Order Number DE93605433. Source: OSTI; NTIS (US Sales Only); INIS.

The previous study (Eltayeb and Hassan, 1992) of the two-dimensional diffusion equation of dust over a rough ground surface, which acts as a dust source of variable strength, under the influence of horizontal wind and gravitational attraction is here extended to all finite values of the roughness height Z_0. An analytic expression is obtained for the concentration of dust for a general strength of the source. The result reduces to the previously known solutions as special cases. The expression for the concentration has been evaluated for some representative example of the source strength g(X). It is found that the concentration decreases with roughness height at any fixed point above ground level. (author). 4 refs, 2 figs.

1567 (INFO–0378) **Earthquake-Induced liquefaction in Ferland, Quebec.** Tuttle, M. (Multi-Agency Group for Neotectonics in Eastern Canada (Canada)); Seeber, L. Atomic Energy Control Board, Ottawa, ON (Canada). Feb 1991. 59p. (MAGNEC-C–91-01.). Order Number DE93603573. Source: OSTI; NTIS (US Sales Only); INIS.

Detailed geological investigations are under way at a number of liquefaction sites in the Ferland-Boilleau valley, Quebec, where sand boils, ground cracks and liquefaction-related damages to homes were documented immediately following the Ms=6.0, Mblg=6.5 Saguenay earthquake of November 25, 1988. To date, results obtained from these subsurface investigations of sand boils

at two sites in Ferland, located about 26 km from the epicentre, indicate that: the Saguenay earthquake induced liquefaction in late-Pleistocene and Holocene sediments which was recorded as sand dikes, sills and vents in near-surface sediments and soils; earthquake-induced liquefaction and ground failure have occurred in this area at least three times in the past 10,000 years; and, the size and morphology of liquefaction features and the liquefaction susceptibility of source layers of the features may be indicative of the intensity of ground shaking. These preliminary results are very promising and suggest that with continued research liquefaction features will become a useful tool in glaciated terrains, such as northeastern North America, for determining not only the timing and location but also the size of past earthquakes.

1568 (INFO–0411) **Aqueous uranium concentrations in the natural environment.** Anderson, M.T. (Environmental and Technological Research Associates Ltd., (Canada)). Atomic Energy Control Board, Ottawa, ON (Canada). Apr 1992. 110p. Order Number DE93603557. Source: OSTI; NTIS (US Sales Only); INIS.

Published geochemical data from groundwater and surface water throughout the world has been compiled in order to compare the concentration of naturally occurring dissolved uranium to lithology, sampling depth, pH, Eh, HCO_3, SO_4 and PO_4 concentrations. The sole criterion used for the selection of data from the review articles was that each article contain raw data on naturally occurring uranium concentrations relative to other groundwater chemical components. A total of 1286 chemical data entries were used in the statistical comparisons. Although this database is not exhaustive, it is likely that the ranges of uranium concentrations in the data set are representative of the ranges occurring in nature. Finally, the observed uranium concentration distributions were compared with published results of model calculations and of used nuclear fuel leach tests. Models tend to predict a wider range of concentrations than observed (particularly the high values), and the leach test concentrations tend to fall within the upper half of the observations.

1569 (INIS-BR–2940) **Brazil Geological Basic Survey Program: special project of mineral resources, soils and vegetation maps for the region of Grande Carajas Program - Mineral resources sub project - Serra dos Carajas - Sheet SB.22-Z-A - Para State.** Araujo, O.J.B. de; Maia, R.G.N. Departamento Nacional de Producao Mineral (DNPM), Brasilia, DF (Brazil); Companhia de Pesquisas de Recursos Minerais (CPRM), Rio de Janeiro, RJ (Brazil). 1991 162p. (In Portuguese). Order Number DE93603543. Source: OSTI; NTIS (US Sales Only); INIS.

The geologic landscape at Serra dos Carajas Sheet encloses portions of Southern Para granite-greenstone terrain, Itacaiunas and Araguaia Belts as well as Proterozoic litho-structural components. It shows medium magnetic relief and low radiometric levels due to meta mafic-ultramafic sequences and the high Na granitoids intrusions. The Proterozoic components are represented by a series of anorogenic granitic intrusions shown by distinctive aero gamaspectrometric anomalies. The well known metallogenetic characteristics includes gold, iron, manganese, nickel and aluminium mines and/or deposits and several mineral occurrences mainly chromium, tin, copper, and zinc. (author).

1570 (INIS-BR–2941) **Brazil Geological Basic Survey Program - Espera River - Sheet SF.23-X-B-IV - Minas Gerais State.** Raposo, F.O. Departamento Nacional de Producao Mineral (DNPM), Brasilia, DF (Brazil); Companhia de Pesquisas de Recursos Minerais (CPRM), Belo Horizonte, MG (Brazil). Superintendencia Regional de Belo Horizonte. 1991 196p. (In Portuguese). Order Number DE93603544. Source: OSTI; NTIS (US Sales Only); INIS.

The present report refers to the Rio Espera sheet (SF.23.X-B-IV) systematic geological mapping, on the 1:100.000 scale. The sheet, which covers Zona da Mata region, includes the Southeastern bord of Minas Gerais Metallurgic Zone, SE of Quadrilatero Ferrifero, in the Sao Francisco craton bord, and Mantiqueira province. Since only one doubtful 2,5 thousand million year - Rb/Sr isochron was obtained in the sheet, Archacan and Proterozoic ages have been attributed to the metamorphic rocks by comparison to other ones elsewhere. An analysis of the crustal evolution pattern based on gravimetric survey data, aeromagnetometry and available geochronological data is given in the 6. Chapter, Part II of the text. Major elements oxides and rare-earths were analysed to establish parameters for the rocks environment elucidation. The geochemical survey was carried out with base on pan concentrated and stream sediments distributed throughout the sheet. (author).

1571 (KAERI/RR–1042/91) **Study on radioactivation analysis.** Chung, Yong Sam (Korea Atomic Energy Research Inst., Daeduk (Korea, Republic of)); Cho, Seung Yeon; Chung, Young Ju. Korea Atomic Energy Research Inst., Daeduk (Korea, Republic of). Jan 1992. 67p. Order Number DE93605426. Source: OSTI; NTIS (US Sales Only); INIS.

Thermal and epithermal neutron activation analysis followed by high resolution gamma-ray spectrometry, is applied to determine trace elements in the silicate rocks. Epithermal neutron irradiations reduce interfering activities such as ^{38}Cl,^{66}Cu,^{56}Mn,^{24}Na,^{46}Sc, etc. The effect is represented as the advantage factors for various elements. The concentrations of 40 elements with the detection limits are determined under the analytical condition. The precision and accuracy of the method are compared with the results of USGS standard's rock, G-2 and AGV-1 analyses. (Author).

1572 (LA–12206) **Atlas of the breeding birds of Los Alamos County, New Mexico.** Travis, J.R. (Pajarito Ornithological Survey, NM (United States)). Los Alamos National Lab., NM (United States); Pajarito Ornithological Survey, NM (United States). Oct 1992. 291p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. Order Number DE93002118. Source: OSTI; NTIS; GPO Dep.

This atlas shows the geographic distribution of breeding birds within the county of Los Alamos, New Mexico, based on field surveys from 1984 through 1988. The county was divided into 60 square blocks, each 2.5 kilometers on a side. We attempted to confirm breeding of all the bird species in every block. The atlas maps show the distribution of the 112 species found. Breeding dates and other information on breeding behavior are provided, and species distribution patterns and species-habitat relationships in the county are presented.

1573 (LA–12335-MS) **The Cambric migration experiment: A summary report.** Bryant, E.A. Los Alamos National Lab., NM (United States). Sep 1992. 37p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. Order Number DE92040619. Source: OSTI; NTIS; INIS; GPO Dep.
